| 20110 | ANY23-83    | Hi Peter, {bq} I am not familiar enough with the rest of the codebase to know why the shortlist of supported parsers is in place {bq} Although I have tried to get to grips with as much of the codebase as I have a use-case for, I am sorry as I cannot provide insight into the original design considerations which you refer to... maybe one of the other guys could chime in here and clear the picture for us? I must admit though, I am in agreement with your overall analysis and think that the more extensible we can make the Any23 libraries the better. There was some discussion however over in ANY23-19 where the vision was to have an abstraction layer between Any23 and the underlying RDF API's. In my opinion, this would provide far greater potential for us to make Any23 a more flexible library... wdyt?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <a href="https://issues.apache.org/jira/browse/ANY23-83">https://issues.apache.org/jira/browse/ANY23-83</a>   |
| 20111 | ANY23-83    | I like these two patches and based on the conversation on any23-dev give the +1. Marking for 0.7.0 and happy to commit on behalf of Peter unless there are objections?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="https://issues.apache.org/jira/browse/ANY23-83">https://issues.apache.org/jira/browse/ANY23-83</a>   |
| 20112 | ANY23-83    | I rebased my git repository onto a copy of the current trunk to check how many patches I still had in this area and noticed that RDFSchemaUtils still hardcodes the supported formats. I may not be seeing the significance of VocabularyFormat currently, but I assume that it could be generalised to any RDFFormat. Is it related to the ability to type in a human readable alias for the format in VocabPrinter? If so, have you tried using RDFFormat.valueOf(String) in the converter inside VocabPrinter which matches against registered formats using: format.getName().equalsIgnoreCase(formatName) These names may not exactly match the historical names for each format that were previously used, but they are extensible at runtime so it makes RDFSchemaUtils easier to maintain. This may also help with ANY23-3 as N3 would be available, although it would just be the Turtle subset in practice as we only hold RDF triples in memory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <a href="https://issues.apache.org/jira/browse/ANY23-83">https://issues.apache.org/jira/browse/ANY23-83</a>   |
| 20113 | ANY23-75    | Setting for 0.7.0-incubating. Is it possible for you to explain a bit about the patch and the underlying reason as to why the existing parser implementation seems to clog up? Also this is really trivial but can you please have a look at the coding format if it differs or not. My initial thoughts of the patch are great, it's a nice one to have caught, but some additional explanation would really help us out. Thank you very much. Lewis                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <a href="https://issues.apache.org/jira/browse/ANY23-75">https://issues.apache.org/jira/browse/ANY23-75</a>   |
| 20114 | ANY23-70    | Yep, unfortunately, as Lewis put it they are "horrible for searching". I usually end up doing searches elsewhere. Is there a way to search on the Apache mail archive?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="https://issues.apache.org/jira/browse/ANY23-70">https://issues.apache.org/jira/browse/ANY23-70</a>   |
| 20115 | ANY23-69    | Does this duplicate ANY23-7 ?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <a href="https://issues.apache.org/jira/browse/ANY23-69">https://issues.apache.org/jira/browse/ANY23-69</a>   |
| 20116 | ANY23-69    | Yeah OK thnaks for clarification. The W3C guys that chimed in on the thread on any23-dev, stated that they would like us to produce this by the end of the month so we have plenty of time to cook something up. I had a look into the RDFa 1.1. spec, and subsequently into the EARL spec... unsurprisingly it's left me a bit puzzled as to how to pull this together so I was going to start a thread on our dev list. However this is as good a place as any I suppose. Have you any initial thoughts Michele?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <a href="https://issues.apache.org/jira/browse/ANY23-69">https://issues.apache.org/jira/browse/ANY23-69</a>   |

| 20117 | ANY23-65    | Well, last night I found that no, it isn't working flawlessly. I was just looking at the whole thing again to trace what is going wrong. I was about to send my XSLT file to the Sindice-dev mailing list, to bridge the period between now and the moment Sindice starts using Any23 0.7.0, when I thought of an edge case to test against. My stylesheet doesn't handle it well, and neither does my build from the SVN code. The case: when a prefix attribute contains "rnews:http://www.iptc.org/std/rNews/1.0:foaf:http://xmlns.com/foaf/0.1/ dbpedia:http://dbpedia.org/resource/" (no space between prefix name and prefix URI, but at least one prefix URI ending with a colon), my stylesheet wrongly assumes there are spaces between prefix name and prefix URI, because it tests whether the attribute contains ": ". The RDFa11Parser outputs warnings that it cannot map the foaf prefix when I test it on my 0.7.0 build. It is an edge test case because it is invalid content for a prefix attribute, but since I saw that Any23 is accepting / testing against no-space prefix definitions and I think namespace URIs with a colon are valid (e.g. <http://dbpedia.org/resource/Category:>), I figured it made an interesting test case. I sent the file anyway, with this test result too :) Another issue I have is that the RDFa11Parser doesn't infer the right triples from <link> elements with a @rel in the <head> section. I believe the @rel values "icon", "stylesheet", "bookmark" etc are to be treated specially. Sindice (Any23 0.6.1) produces URIs for these like <http://www.w3.org/1999/xhtml/vocab#icon> from my blog post. When I extract from my blog post locally, I get properties like <http://ben.companjen.name/2011/08/het-gezin-timmer-de-bruijn-in-amsterdam/icon>. The parser (also) complains my HTML doesn't declare 'xmlns="http://www.w3.org/1999/xhtml"'. I couldn't find the part of the HTML or RDFa specifications that says it should do so - as far as I can tell it's not necessary in HTML5. Looking at the code, I see some references to RDFa 1.0 in the comments in the processDocument method. This method seems to be the source for the complaint. Maybe the problem and complaint (well, warning actually) are linked? And maybe the incorrect handling of the @rel values is also linked to "/" TODO: introduce support for RDFa profiles. (http://www.w3.org/TR/rdfa-core/#s_profiles)"? BTW, these profiles don't exist (anymore) in RDFa Core. I hope someone can shed more light on this, I'm too confused from reading all the RDFa related docs and drafts right now :) | <a href="https://issues.apache.org/jira/browse/ANY23-65">https://issues.apache.org/jira/browse/ANY23-65</a> |
| 20118 | ANY23-61    | The repo directory is a maven repository. Are the artifacts in this directory in another maven repository? We are currently deploying snapshots to the Apache Snapshots repository and new releases to the Apache staging server, based on the definitions in the apache-10.pom parent.<br>http://svn.apache.org/repos/asf/maven/pom/tags/apache-10/pom.xml                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/ANY23-61">https://issues.apache.org/jira/browse/ANY23-61</a> |
| 20119 | ANY23-50    | I had a look to the patch and it looks very nice. If the META-INF data is built at compile time and it is not necessary to package the plugins to annotate them I don't have any other concern about applying this simplification. How does it work / does it work the hot-loading with ServiceLoader?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <a href="https://issues.apache.org/jira/browse/ANY23-50">https://issues.apache.org/jira/browse/ANY23-50</a> |
| 20120 | ANY23-50    | Hola! META-INF/services metadata are always generated at compile time, indeed plugins are annotated with [MetalnService] http://weblogs.java.net/blog/kohsuke/archive/2009/03/my_project_of_t.html that is part of a provided-scope Annotation Processor wrote by Kohsuke (the Hudson/Jenkin's father) In Any23 the ServiceLoader is used inside the the Any23PluginManager, relying on the already managed dynamic ClassLoader, so when adding new jars/resources at runtime to the ClassLoader, SL queries it. I think that the same strategy can be applied to Extractors' factories as well, WDYT? Anyway, please double-ack if you agree I can commit the modification! TIA!                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="https://issues.apache.org/jira/browse/ANY23-50">https://issues.apache.org/jira/browse/ANY23-50</a> |
| 20121 | ANY23-50    | I think this should definitely be committed? Once question, is there anything specific about the Any23 plugin system which make this issue only applicable to Any23? What I mean, is would it be possible to apply this issue in a project elsewhere which relies heavily on plugins? (e.g. Nutch)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <a href="https://issues.apache.org/jira/browse/ANY23-50">https://issues.apache.org/jira/browse/ANY23-50</a> |
| 20122 | ANY23-48    | OK so Committed @ revision 1303963 in site. I also committed some changes to trunk but I can't remember which revision. If someone could please review where we are with this one, unless someone can point me to further improvement (which obviously I'm very open to) then I'd like to close this one off so we can focus on some of the other issues which lie between us and the 0.7.0-incubating release. Thanks                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <a href="https://issues.apache.org/jira/browse/ANY23-48">https://issues.apache.org/jira/browse/ANY23-48</a> |
| 20123 | ANY23-46    | Thanks Andy. Taking this forward, obviously we can copy in Any23-dev@ anyway, but do we wish to combine these resources requests to infra@, e.g. is there any way that we can share resources to limit the infra@ involvement if you were wanting to bring the SPARQL stuff to ASF as well?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/ANY23-46">https://issues.apache.org/jira/browse/ANY23-46</a> |
| 20124 | ANY23-38    | @Lewis, you mean org.apache.any23.util.LogUtils or what? That one is used to activate / deactivate the verbose mode of CLI tools by changing the log level programmatically.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <a href="https://issues.apache.org/jira/browse/ANY23-38">https://issues.apache.org/jira/browse/ANY23-38</a> |
| 20125 | ANY23-38    | Upon closer inspection looks like your correct Michele. What about we re-factor this issue to address Simone's opinions? I'm a +1 forSlf4j                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <a href="https://issues.apache.org/jira/browse/ANY23-38">https://issues.apache.org/jira/browse/ANY23-38</a> |
| 20126 | ANY23-36    | I genuinely have not got a clue what has to be done to resolve this one. I've tried using the maven changes plugin but getting nowhere. Anyone else got a scoop?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="https://issues.apache.org/jira/browse/ANY23-36">https://issues.apache.org/jira/browse/ANY23-36</a> |
| 20127 | ANY23-36    | Isn't this issue related to Any23 history munging?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <a href="https://issues.apache.org/jira/browse/ANY23-36">https://issues.apache.org/jira/browse/ANY23-36</a> |
| 20128 | ANY23-33    | I attempted to replace the classes with public implementations, but the once found within the classpath are marked as @deprecated. Ideas? {code} -import com.sun.org.apache.xml.internal.serialize.OutputFormat; -import com.sun.org.apache.xml.internal.serialize.XMLSerializer; +import org.apache.xml.serialize.OutputFormat; +import org.apache.xml.serialize.XMLSerializer; {code}                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <a href="https://issues.apache.org/jira/browse/ANY23-33">https://issues.apache.org/jira/browse/ANY23-33</a> |
| 20129 | ANY23-33    | Are you getting this from your compiler output? I've not tried to implement yet. We don't explicitly depend upon any xerces related stuff in the parent pom.xml, so I am curious where the imports are being pulled from for you to get this output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <a href="https://issues.apache.org/jira/browse/ANY23-33">https://issues.apache.org/jira/browse/ANY23-33</a> |
| 20130 | ANY23-32    | Thanks Mic for reporting! I need indeed doing more work on the service, my bad that I didn't notice! there is a specialized README in the produces distribution package that explains how to install&run, can you double check please? TIA!                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/ANY23-32">https://issues.apache.org/jira/browse/ANY23-32</a> |
| 20131 | ANY23-26    | Hi Peter. Regarding your edited comment above. Have you started/finished work on the Extractor factory patterns? I would like to get this issue integrated into trunk... therefore I need to test it. If the answer to the above is yes, are you able to produce a patch which I can apply to the SVN trunk HEAD? Thank you                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/ANY23-26">https://issues.apache.org/jira/browse/ANY23-26</a> |
| 20132 | ANY23-26    | Has anyone else had the opportunity to test Peters patches? There are some trivial issues which we have discussed off list but generally speaking the spi and tika upgrades look dynamite to me. I also confirm that all tests pass locally for these patches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/ANY23-26">https://issues.apache.org/jira/browse/ANY23-26</a> |
| 20133 | ANY23-21    | Is there an automated tool for doing this?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <a href="https://issues.apache.org/jira/browse/ANY23-21">https://issues.apache.org/jira/browse/ANY23-21</a> |
| 20134 | ANY23-19    | Hey Paolo, with regards to Chris' recent comments on the dev list and the stub report he filed, how did you get on wrt moving away from the packages you've highlighted above and also with progressing with more collaboration between ASF RDF-type projects? I'm using this issue as a basis to kick the conversation off and hopefully others will join in.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/ANY23-19">https://issues.apache.org/jira/browse/ANY23-19</a> |

| #     | Requirement  | Questions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | URL                                                                                                                 |

| 20135 | ANY23-19     | Hi Max, the thing is: adding yet another dependency is going to make Any23 bigger and more complex. Can something simple be done without adding yet another dependency? As I said, an example of a small RDF distiller which does this is java-rdfa ( <a href="https://github.com/shellac/java-rdfa">https://github.com/shellac/java-rdfa</a> ). Third party RDF APIs become only an optional dependency and people are free to choose which one they want/need simply adding that to their classpath (in a very similar way to what SLF4j does for logging frameworks). The only thing tricky is "validation", but Any23 could chose not to validate URLs/IRIs, etc. and simply relay on the third party RDF APIs to do that.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <a href="https://issues.apache.org/jira/browse/ANY23-19">https://issues.apache.org/jira/browse/ANY23-19</a>         |
| 20136 | ANY23-19     | Hi Paolo, The example library that is continually being referred to here, java-rdfa, abstracts away from clerezza, sesame and jena interfaces by representing everything as strings. See <a href="https://github.com/shellac/java-rdfa/blob/master/core/src/main/java/net/rootdev/javardfa/StatementSink.java">https://github.com/shellac/java-rdfa/blob/master/core/src/main/java/net/rootdev/javardfa/StatementSink.java</a> The java-rdfa library is also not being developed or used actively, so it isn't the best example of a successful library that doesn't use a type-safe RDF Statement/Value API. I worked on java-rdfa a little but there is no push behind it. Even its author refers to it as "The cruftiest RDFa parser in the world" Two of the three goals of Any23, command line utility, and web service, are completely ambivalent to the technology being used internally, as long as it is high quality, and the Sesame libraries are very high quality in my opinion and experience. The only goal that would be affected would be the use of Any23 as a library. How often is Any23 currently being used as a library? Could another project easily implement the same functionality using Jena with less effort than it would take to either create a custom string based solution, or move to another framework that may have just as many or more dependencies? In terms of the use of Any23 as a library, is there anything about the Sesame Model hierarchy (Value/Resource/Literal/BNode/URI) that would be better represented using a custom solution? As one example, I have been working with OWLAPI recently and its RDF handling is shocking, it merges URIs with Blank Nodes to form what it refers to as IRIs. It has a custom internal solution that only recognises two types of triples, those with an IRI in the object position (where IRI is not type-safely defined between URI and BlankNode) and those with Literals in the object position. I can't imagine Any23 going down this route, but it is the worst case scenario if the API is converted without a reason. In the simplest scenario, it may be possible to reuse the Sesame Model hierarchy to produce Values that work across all three libraries, using custom ValueImpl etc., implementations that actually implement the relevant interfaces from other libraries, along a custom ValueFactory to produce these multi-library-compatible Values (custom ValueFactories can be plugged into any Rio Parser using <code>Rio.getParser(RDFFormat, ValueFactory)</code> ), a functionality which I haven't seen in other libraries). In terms of the actual packages that are currently used, there are four basic packages sesame-model, sesame-rio-api, sesame-repository-api, sesame-sail-api, sesame-sail-memory. These base libraries are small dependencies. One other dependency is some small utilities, sesame-util that are used by sesame-model and other sesame libraries. 82K - sesame-model-2.6.5.jar 36K - sesame-repository-api-2.6.5.jar 22K - sesame-rio-api-2.6.5.jar 56K - sesame-sail-api-2.6.5.jar 54K - sesame-sail-memory-2.6.5.jar 53K - sesame-util-2.6.5.jar The value Impl classes should not be directly referenced. They should be accessed using a ValueFactory and used as their Interfaces. This doesn't change any of the libraries that are used, but it is better practice. The other libraries that pull in the Rio parsers can be linked in dynamically without compiling in the dependency, so the use of Any23 as a library would enable people to pull them in as needed. See <code>Rio.getParser(RDFFormat, ValueFactory)</code> and <code>Rio.getWriter(RDFFormat)</code> methods. It would be valuable if Any23 could dynamically pull in all of its parsers and writers using the <code>Rio.*</code> static methods. Then it could be used with the absolute minimum number of parsers and writers for the current user. 4.6K - sesame-rio-n3-2.6.5.jar 14K - sesame-rio-ntriples-2.6.5.jar 33K - sesame-rio-rdfxml-2.6.5.jar 17K - sesame-rio-turtle-2.6.5.jar Switching to another library may cause the bloat that you say you do not want. For example, Jena and its immediate dependencies is quite large compared to the modular sesame jar files, and that doesn't include the SPARQL parsing libraries from ARQ, as indeed the sesame libraries quote above do not include the sparql libraries. 1.7M - jena-core-2.7.0-incubating.jar 151K - jena-iri-0.9.0-incubating.jar 3.1M - icu4j-3.4.4.jar 1.4M - xercesImpl-2.10.0.jar | <a href="https://issues.apache.org/jira/browse/ANY23-19">https://issues.apache.org/jira/browse/ANY23-19</a>         |
| 20137 | ANY23-18     | Ciao Michele, what are the problems you found with java-rdfa? There is an open issue for java-rdfa to add RDFa 1.1 support ( <a href="https://github.com/shellac/java-rdfa/issues/24">https://github.com/shellac/java-rdfa/issues/24</a> ). In any case, good to see the XSLT replaced by a new programmatic RDFa extractor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="https://issues.apache.org/jira/browse/ANY23-18">https://issues.apache.org/jira/browse/ANY23-18</a>         |
| 20138 | ANY23-11     | I've updated the w3c page above, but can't seem to create an account for the RDFizers!!! Is there anything else we wish to add to this issue? I think it goes to say that at any given opportunity make people aware of Any23.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <a href="https://issues.apache.org/jira/browse/ANY23-11">https://issues.apache.org/jira/browse/ANY23-11</a>         |

| 20141 | ANY23-3      | Are there any full N3 implementations in Java? Sesame and Jena both parse the RDF subset, but not the full N3 grammar. In practice, the RDF subset amounts to Turtle. Is Any23 interested in the non-RDF components of N3?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <a href="https://issues.apache.org/jira/browse/ANY23-3">https://issues.apache.org/jira/browse/ANY23-3</a>           |
| 20142 | ANY23-2      | @Peter, Are you interested in committing this in line with thr new SPI Factory implementation you wrote?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <a href="https://issues.apache.org/jira/browse/ANY23-2">https://issues.apache.org/jira/browse/ANY23-2</a>           |
| 20143 | APEXCORE-764 | Could you please add some more description as to what the refactoring entails?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <a href="https://issues.apache.org/jira/browse/APEXCORE-764">https://issues.apache.org/jira/browse/APEXCORE-764</a> |
| 20144 | APEXCORE-735 | Could you add the reason for the change.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <a href="https://issues.apache.org/jira/browse/APEXCORE-735">https://issues.apache.org/jira/browse/APEXCORE-735</a> |

| 20146 | APEXCORE-725 | PR 624 is actually unrelated to this ticket; since PR 529 is now merged, shouldn't this ticket be resolved ?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <a href="https://issues.apache.org/jira/browse/APEXCORE-725">https://issues.apache.org/jira/browse/APEXCORE-725</a> |
| 20147 | APEXCORE-714 | <p>Thomas, My responses are inline.. On Tue, Apr 25, 2017 at 8:42 AM, Thomas Weise &lt;thw@apache.org&gt; wrote: Pramod, Sounds like some sort of alternative "processing mode" that from engine perspective allows potentially inconsistent state when there is a pipeline failure. This is of course only something the user can decide. &gt;&gt; Calling it an alternate processing mode is a good idea. Does the proposal assume that the operator state is immutable (or what is sometimes tagged with the stateless annotation)? For example an operator that has to load a large amount of state from another source before it can process the first tuple? &gt;&gt; Operator state can change, not necessarily stateless. Stateless may not automatically fall into this category as our current definition of stateless denotes window level stateless and not necessarily tuple level. Also, it would be an optimization but not something that will help with SLA if the operator still needs to be recovered when its own container fails. It might help to clarify that and also why there is a need to recover in the batch use case (vs. reprocess). &gt;&gt; Correct, as I mentioned in the last statement, if the container where the operator is running itself goes down then it is recovery from checkpoint and business as usual. I may have misspoken about batch, meant to say apps where operators have large state not necessarily batch, the use case we are dealing with is batch and restart is not practical as the run takes a long time. Thanks, Pramod</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <a href="https://issues.apache.org/jira/browse/APEXCORE-714">https://issues.apache.org/jira/browse/APEXCORE-714</a> |
| 20148 | APEXCORE-712 | I think you mean to have SSL_CONFIG as a more complex object like a POJO instead of a filename that refers to a file that contains all ssl related properties. That works for me in terms of more direct way to specifying these properties. Why would we need the long naming, using hadoop specific names, for the properties of that object. Why can't they be specified with regular field names like keystoreLocation, keystorePassword, keyPassword etc. This way the user does not need to be aware of the actual property names being used by hadoop and is more portable in case we support another runtime in the future. For convenience, for the user, the entire object with the field values can be specified as a single String property as defined by the StringCodec.Object2String class. I would prefer a more targeted name like MANAGEMENT_SSL_CONFIG as I am not sure if this would be enough to support any SSL configuration needed in future (like if this is used for encryption data flow itself). But, if you want to go with SSL_CONFIG I would be ok.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/APEXCORE-712">https://issues.apache.org/jira/browse/APEXCORE-712</a> |
| 20149 | APEXCORE-711 | [~sanjaypujare] There seems to be a strong dependency on Hadoop version where YARN-6457 will be fixed. As YARN-6457 by itself seems to depend on YARN-4562 that is only fixed in 2.9, will the fix require Hadoop 2.9 as well?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <a href="https://issues.apache.org/jira/browse/APEXCORE-711">https://issues.apache.org/jira/browse/APEXCORE-711</a> |
| 20150 | APEXCORE-711 | [~sanjaypujare] While fix does not introduce a regression, it introduces an attribute that has no meaning unless a user upgrades to Hadoop 2.9. I'd like to see if there is a solution that does not depend on Hadoop upgrade. Additionally, how was it prototyped without YARN-6457 being fixed?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <a href="https://issues.apache.org/jira/browse/APEXCORE-711">https://issues.apache.org/jira/browse/APEXCORE-711</a> |
| 20151 | APEXCORE-711 | I'd prefer not to rely on YARN-6457 and YARN-4562 be ported to older versions of hadoop-yarn-common. YARN-4562 is marked as resolved on 2.9 and 3.0, so it does not look that it will eventually make into 2.7.1. There is still no agreement on how YARN-6457 will be fixed. Instead of relying on YARN-6457, can we implement a class that extends org.apache.hadoop.yarn.webapp.WebApps or provides similar functionality and that does not have the same limitation as YARN-6457?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/APEXCORE-711">https://issues.apache.org/jira/browse/APEXCORE-711</a> |

| #     | Requirement  | Questions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | URL                                                                                                                 |

| 20152 | APEXCORE-711 | Recapping my earlier analysis about eliminating dependencies on Hadoop/Yarn: - In org.apache.hadoop.yarn.webapp.WebApps.Builder<T> the start(WebApp) method does bulk of the work in creating the WebApp container object. The problematic line in this method currently is WebAppUtils.loadSslConfiguration(builder); which does not pass (honor) the config object passed to Builder.with(Configuration). The above line should be changed to WebAppUtils.loadSslConfiguration(builder, conf); which passes the required config object. Since a class static method (WebAppUtils.loadSslConfiguration) is being called there is no way to get the new behavior by subclassing a class and overriding a simple method. All of the code in org.apache.hadoop.yarn.webapp.WebApps.Builder.start(WebApp) will need to be copied in a new class on the Apex core side. BTW, precisely because of this, https://issues.apache.org/jira/browse/YARN-4562 was created and fixed (albeit in 2.9.x and not in any earlier version) - with this we still have an unresolved issue in the current Yarn. The current code in org.apache.hadoop.yarn.webapp.util.WebAppUtils.loadSslConfiguration(Builder, Configuration) is as follows (trimmed): public static HttpServer2.Builder loadSslConfiguration( HttpServer2.Builder builder, Configuration sslConf) { if (sslConf == null) { sslConf = new Configuration(false); } boolean needsClientAuth = YarnConfiguration.YARN_SSL_CLIENT_HTTPS_NEED_AUTH_DEFAULT; sslConf.addResource(YarnConfiguration.YARN_SSL_SERVER_RESOURCE_DEFAULT); return ... } which has 2 major issues: a) The caller can set SSL properties in the passed sslConf object but they are overridden by the default ssl-server.xml file because of the sslConf.addResource(...) call. There is no way to point to a different XML file (because it uses the hardcoded YARN_SSL_SERVER_RESOURCE_DEFAULT value and not the value of a property) which defeats the very purpose. b) the only way to solve (a) above is to mark the value final in the passed sslConf object in which case the default ssl-server.xml values won't be applied even if they are final there. Both of these are addressed by the changes in this JIRA. | <a href="https://issues.apache.org/jira/browse/APEXCORE-711">https://issues.apache.org/jira/browse/APEXCORE-711</a> |
| 20153 | APEXCORE-699 | I guess that the proper way to support compatible Plugin interface modifications and versioning is to extend an existing interface. For example, if a new version of a Plugin introduces new method foo(), the new version should be defined as {code} interface PluginV2 extends Plugin { void foo(); } {code} On the other side, plugins should be able to check engine version and prevent the platform from loading plugin if the platform does not meet version requirements. Such information can be passed using PluginContext and does not require Plugin interface changes. With the proposed design, will it be OK to exclude Plugin versioning changes from 3.6.0 release?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <a href="https://issues.apache.org/jira/browse/APEXCORE-699">https://issues.apache.org/jira/browse/APEXCORE-699</a> |
| 20154 | APEXCORE-694 | jsr305 is dormant, I see musings on the web that it never became a standard. Can you verify?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <a href="https://issues.apache.org/jira/browse/APEXCORE-694">https://issues.apache.org/jira/browse/APEXCORE-694</a> |
| 20155 | APEXCORE-673 | Would this be to a public or some internal location? Don't you want to push to public location only on releases?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <a href="https://issues.apache.org/jira/browse/APEXCORE-673">https://issues.apache.org/jira/browse/APEXCORE-673</a> |
| 20156 | APEXCORE-670 | Ah, of course the _target_ needs to be included in there as well. In my understanding, your cURL request would change the log level of the classes used by the stram? This would differ from setting the log levels in the operators, right? Example: {code} curl -H "Content-Type: application/json" -X POST \ -d '{"loggers":[{"target":"org.apache.apex.examples.pi.*","logLevel":"TRACE"}]}' \ http://apex-sandbox:9090/ws/v2/applications/application_1499808956620_0803/loggers {code} In this case, should we use two separate commands for setting the log levels in stram / operators?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <a href="https://issues.apache.org/jira/browse/APEXCORE-670">https://issues.apache.org/jira/browse/APEXCORE-670</a> |
| 20157 | APEXCORE-670 | So an example for the new command in the CLI could be: {code}apex>set-log-level application_1499808956620_0873 org.apache.apex.examples.pi.PiCalculateOperator TRACE{code} OR {code}apex (application_1499808956620_0873) >set-log-level org.apache.apex.examples.pi.PiCalculateOperator TRACE{code} I will open a pull request with an exemplary implementation of this. Should the validation of the logLevel happen on the APEX CLI side? Currently it will just ignore any logLevel that is not valid                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="https://issues.apache.org/jira/browse/APEXCORE-670">https://issues.apache.org/jira/browse/APEXCORE-670</a> |
| 20158 | APEXCORE-670 | Do other commands that interact with applications accept an application parameter? If not, then we should not introduce it here either.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/APEXCORE-670">https://issues.apache.org/jira/browse/APEXCORE-670</a> |
| 20159 | APEXCORE-635 | The end goal of the override BufferServerPublisher.write() in is not clear. Why is the override necessary? It is also not clear why Kryo (that is a library designed to do efficient serialization and de-serialization) will not match the proposed mechanism. If the goal is to serialize Collections (list in the example) using Kryo, Kryo has CollectionsSerializer and will (should?) do something similar to what is proposed. IMO, it will be much better not to even use Kryo when Tuples are strongly typed and implement StreamCodec without using Kryo. Default StreamCodec is provided to handle cases when Tuples are not strongly typed, in which case it is required to use reflection. The same will apply to unchecked Collections. (n) till all those issues are resolved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <a href="https://issues.apache.org/jira/browse/APEXCORE-635">https://issues.apache.org/jira/browse/APEXCORE-635</a> |
| 20160 | APEXCORE-635 | - Memory copy is required as it moves data from JVM heap to direct (off-heap) buffer. It is done prior to writing the buffer to a network channel. - Please benchmark copying one large block of memory in a single step and in multiple steps. What is the difference (in %)? Do the same for a direct buffer. - How will control tuples be injected into a continuous block of memory? - The current approach is fire and forget, the proposed requires some kind of an acknowledgment. I am not convinced that the design that requires an acknowledgment will be faster. - There is a plan to move to netty from netlet and netty provides buffer pool allocator that may better fit the proposed design. - The current format uses variable length (1, 2, 3 or 4 bytes) prefix and it is not possible to know offset where data needs to be written prior to the length of the serialized data is known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <a href="https://issues.apache.org/jira/browse/APEXCORE-635">https://issues.apache.org/jira/browse/APEXCORE-635</a> |

| 20161 | APEXCORE-635 | <p>- If we use direct buffer, it seems ByteBuffer has no way to avoid memcopy. What I meant to avoid memcopy and garbage collection is explained as following by comparing details of current and new procedure( assume each tuple serialized to N bytes, and write M tuples in one time):</p> <p>current procedure(use kryo serde as example):</p> <ol style="list-style-type: none"> <li>1) kryo serde: write data to buffer of kryo's output, assume the length of bytes is N</li> <li>2) call Output.toBytes() to get bytes from kryo: need memcopy, copy N bytes</li> <li>3) put message type and partition: need memcopy, copy N bytes, the total length become N+5; N bytes need to be garbage collected</li> <li>4) repeat 1 to 3 M times, and generate M slices</li> <li>5) copy the M slices to ByteBuffer: M*(N+5) bytes need to be garbage collected</li> <li>6) write ByteBuffer to socket</li> </ol> <p>new procedure(use kryo serde as example):</p> <ol style="list-style-type: none"> <li>1) write message type and partition to SerializationBuffer</li> <li>2) kryo serde: serde to SerializationBuffer, assume the length of bytes is N</li> <li>3) call SerializationBuffer.slice() to get the slice: return the wrapper instead copy the data</li> <li>4) repeat 1 to 3 M times, and generate M slices</li> <li>5) merge the M slices into one in most of case(if these slices in same block). If in different block, probably handle one block each time.</li> <li>6) copy or wrapper the to ByteBuffer. Probably need copy if want to use direct mode.</li> <li>7) write ByteBuffer to socket. reset the SerializationBuffer</li> </ol> <p>So, by comparing current and new procedure, current procedure need to copy around 3*N*M bytes and garbage collection of 2*N*M bytes, but new procedure only need copy N*M bytes and no need garbage collection. So new approach save 2*N*M memory copy and garbage collection.</p> <p>- The memory of different blocks is not continuous as we want dynamic allocate block, but the slices in same block are continuous. As the size of block is much large than slices.</p> <p>- The current fire and forget approach means no way to reuse the memory. That's why need to override write() method by walk around way. The new implementation of write() will reset the SerializationBuffer after wrote data to socket. The new approach don't need acknowledgement neither.</p> <p>- Yes, for variable length, it is not possible to reserve the space for length. But I doubled why we have to use variable length. It save at most 3 bytes for each message, but made parser harder. It's not common for protocols to use variable length. Even IP the fixed length. In worst case, even if we don't use the reserve feature of SerializationBuffer, we still can save 2*N*M memory copy and garbage collection.</p> | <a href="https://issues.apache.org/jira/browse/APEXCORE-635">https://issues.apache.org/jira/browse/APEXCORE-635</a> |
| 20162 | APEXCORE-635 | [~brightchen] What is the overhead of garbage collection? You can take the benchmark application in the Malhar for measurements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <a href="https://issues.apache.org/jira/browse/APEXCORE-635">https://issues.apache.org/jira/browse/APEXCORE-635</a> |
| 20163 | APEXCORE-635 | <p>Hi Vald,</p> <p>- As I understand, array is a kind of object in java. Does java implemented differently? And how can JVM reuse allocated bytes without collection? Do you have any reference I can take a look?</p> <p>- I copied the implementation of kryo Output.toBytes() here ( kryo-2.24.0.jar ). From this implementation toBytes() do allocate new memory and copy.</p> <pre>public byte[] toBytes () {     byte[] newBuffer = new byte[position];     System.arraycopy(buffer, 0, newBuffer, 0, position);     return newBuffer; }</pre> <p>- I can get number, but that means need at least simply prototype. And based on my previous test for serialization string of 1000 ascii, The performance can gain 30%</p> <p>- Yes, it's pretty complex to implement all the proposal. But fortunately, most of memory manage stuff already implemented in Malhar. The things need to do is add some feature and integrate to BufferServer</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/APEXCORE-635">https://issues.apache.org/jira/browse/APEXCORE-635</a> |
| 20164 | APEXCORE-635 | <p>Hi Vlad, I think what you meant the issues I not addressed is a following:</p> <p>- Please benchmark copying one large block of memory in a single step and in multiple steps. What is the difference (in %)? Do the same for a direct buffer.</p> <p>- How will control tuples be injected into a continuous block of memory? my comments as following:</p> <p>- From my previous comments, we can the problem of current mechanism is waste 2 times memory copy and garbage collection. It's not the problem of copy one big bytes in one time or divided into multiple copies.</p> <p>- The control tuples also write to the same SerializationBuffer.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <a href="https://issues.apache.org/jira/browse/APEXCORE-635">https://issues.apache.org/jira/browse/APEXCORE-635</a> |
| 20165 | APEXCORE-635 | <p>bq. As I understand, array is a kind of object in java. Does java implemented differently? And how can JVM reuse allocated bytes without collection? Do you have any reference I can take a look?</p> <p>Yes, an array is an object in java that may hold either primitive types or other objects. When an array is GC, it is GC as a single object. If an array holds primitive types, the array's memory is reclaimed in a single step, there is no GC of individual bytes/int/long in the array.</p> <p>bq. I copied the implementation of kryo Output.toBytes() here ( kryo-2.24.0.jar ). From this implementation toBytes() do allocate new memory and copy. I was referring to Output.getBuffer() and DefaultKryoStreamCodec that uses Output.getBuffer(). You are right that Output.toBytes() allocates a new array and copies bytes from Output internal buffer to the newly allocated buffer. This is a bug in DefaultStatefulStreamCodec, it should use Output.getBuffer().</p> <p>bq. I can get number, but that means need at least simply prototype. And based on my previous test for serialization string of 1000 ascii, The performance can gain 30%</p> <p>As I pointed to you, the prototype has a significant bug (reusing byte arrays that are not reusable due to fire and forget netlet behavior). What I would like to see is a series of small prototypes that prove that the approach provides significant performance gains.</p> <p>I don't see how without modifying the current definition of StreamCodec and StatefulStreamCodec the solution can be generalized. It may be possible to improve DefaultStatefulStreamCodec (concrete implementation of StatefulStreamCodec), but it seems to require a large amount of modifications to netlet and buffer server that other StreamCodec implementations will not benefit from. Additionally, the proposal seems to require netlet client to be aware of codec implementation and any changes to tuple format will require changes to serialization and de-serialization code.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://issues.apache.org/jira/browse/APEXCORE-635">https://issues.apache.org/jira/browse/APEXCORE-635</a> |

| 20166 | APEXCORE-635 | <p>bq. Yes, Agree, One array of byte only treat as one object. But as the memory is relative big, it probably will not allocated in TLA( Thread Local Area ), which means it need to get lock for each allocation, so the allocation is not a very light operation. Is your concern GC or allocating new byte array? From what I understand, it was GC. bq. Output.getBuffer() probably not work in our case. The getBuffer() returns the reference of Output's internal buffer, which was used for putting the serialized bytes. As we need to share one instance of Output for multiple tuples, the buffer was reused when serialize next tuple. Which cause problem no matter we set the output's position to zero or not. If set position to zero, which means clean the previous serialized data. If not changed position, then the serialized data of next tuple concat to the previous one, but we don't know the boundary of each tuple, and the buffer keeping on growing which means output have to keep on allocate new big memory and copy the old data(if the initial buffer size is not very big). Output.getBuffer() works. Tuples are serialized one at a time and after each serialization, bytes from the shared Output buffer are copied to the SerializedTuple that allocates a new buffer each time. It avoids extra copy that you refer to. bq. Yes, the original prototype reset the buffer when it should not. But as I pointed in this proposal, the buffer will be reset after the data sent to socket. That why need to override the write() method. The original prototype has a serious bug, so the results of benchmarking are not reliable. Prior to implementing the proposed approach, I suggest to implement a prototype in stages and have a prove that the approach will provide a significant performance improvement. Without such prove, the complexity of the proposal is not justifiable. bq. Yes, agree. But I think it was worthy to change StreamCode, as suggested in the proposal, it's not easy to implemented the customized reusable serialization without memory copy with the previous interface. And it doesn't compatible with kryo's interface. The current implementation(DefaultStatefulStreamCodec) of StatefulStreamCodec seems not natural for me. The pairs are cleared after first tuple. And for each other tuples, the pairs need to checked, and an instance of DataStatePair need to created to wrapper state(which is null except first tuple) and data. I agree that the interface is not optimal and needs to be changed, but it is not possible to change it without breaking backward compatibility. It means that new interface needs to be introduced and BufferServer will need to deal with 3 different codec interfaces. Before this is done, I'd like to have a prove that there is significant performance benefit that justifies the complexity. bq. The netlet client need to aware of the memory management mechanism in order to reset the memory. But the code is maintained in same class (current BufferServerPublisher; an extended class in proposal), so this should be ok. The serialization formation don't have to change. it can compatible with the previous one. But if we want to take advantage of reserve() function of SerializationBuffer to avoid another extra copy, the format need to be changed to avoid use variable length. Again, I'd like to see a staged prototype that proves that there is a performance benefit and that it is possible to avoid tight code coupling between Codec, Publisher and Tuple serialization format. Overall, I am still (n) on the approach and I think that it needs to be revisited when netlet-&gt;netty migration is done. Netty has it's own memory allocator and it will be necessary to see how it can be integrated with Kryo and other serializers.</p> | <a href="https://issues.apache.org/jira/browse/APEXCORE-635">https://issues.apache.org/jira/browse/APEXCORE-635</a> |
| 20167 | APEXCORE-620 | What is the proposed mechanism to resolve dependencies? Apex application developer should provide .apa file with all dependencies (except the one that will be provided at run-time) resolved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <a href="https://issues.apache.org/jira/browse/APEXCORE-620">https://issues.apache.org/jira/browse/APEXCORE-620</a> |
| 20168 | APEXCORE-612 | Can you please add more details to this? Are you saying you see Out of Sequence for endWindow Tuple?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/APEXCORE-612">https://issues.apache.org/jira/browse/APEXCORE-612</a> |
| 20169 | APEXCORE-592 | QUEUE_CAPACITY is an attribute and not a property of the port. Attributes are defined by the Apex platform and do not change across ports. What is the significance of providing the description for attributes?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <a href="https://issues.apache.org/jira/browse/APEXCORE-592">https://issues.apache.org/jira/browse/APEXCORE-592</a> |
| 20170 | APEXCORE-592 | [~vrozov] The description in properties is required for displaying user the description of properties configurable by user. Would you suggest me filtering out this list so that we return description only for the operator properties?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <a href="https://issues.apache.org/jira/browse/APEXCORE-592">https://issues.apache.org/jira/browse/APEXCORE-592</a> |
| 20171 | APEXCORE-592 | Have you looked at get-jar-operator-properties & get-jar-operator-classes commands in the CLI? They use OperatorDiscoverer (TypeGraph), which reads from the JavaDoc. It is better to explore that option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <a href="https://issues.apache.org/jira/browse/APEXCORE-592">https://issues.apache.org/jira/browse/APEXCORE-592</a> |
| 20172 | APEXCORE-592 | Ok, I am fine with keeping this simple. Why limit it to defaultProperties?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <a href="https://issues.apache.org/jira/browse/APEXCORE-592">https://issues.apache.org/jira/browse/APEXCORE-592</a> |
| 20173 | APEXCORE-587 | Agree with both of you. But how about adding methods prepareDAG to launcher API and launchDAG that takes a prepared DAG and launches it, launchApp will be a combination of both. Also yes for making getDAG() part of AppHandler. Also thomas, the issue is current assigned, do you want to work on it? If so please go ahead otherwise I can work on it as well.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <a href="https://issues.apache.org/jira/browse/APEXCORE-587">https://issues.apache.org/jira/browse/APEXCORE-587</a> |
| 20174 | APEXCORE-581 | Do the streams need to be control tuple aware? It is still a single stream isn't it and the nodes do the de-multiplexing isn't it?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <a href="https://issues.apache.org/jira/browse/APEXCORE-581">https://issues.apache.org/jira/browse/APEXCORE-581</a> |
| 20175 | APEXCORE-580 | UserDefinedControlTuple is a long name for users to use. How about just calling it ControlTuple?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <a href="https://issues.apache.org/jira/browse/APEXCORE-580">https://issues.apache.org/jira/browse/APEXCORE-580</a> |
| 20176 | APEXCORE-577 | Why specifically limit it to client side preparation of the DAG before the application is launched? Why not make it possible to have general hooks that can apply even when the application is running in the different distributed components of the application such as the containers and stram. The hooks could be registered to be asynchronous or synchronous. The asynchronous ones could be handled via a bus, we already have a bus called mbassador that we use today and it could potentially be used for this. The entire functionality is akin to something like dtrace without the dynamic part.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <a href="https://issues.apache.org/jira/browse/APEXCORE-577">https://issues.apache.org/jira/browse/APEXCORE-577</a> |
| 20177 | APEXCORE-576 | As far as I understand then the main enhancement here is the "registry" and a process to pick items from the registry to merge into the main repository and we will be using the current git process of pull-requests and merging across forks. Are there existing models we can look at for the registry? A few things that need to be hammered out: - registry access control, and format - criteria for merging external contributions into the main repo (quality, unit tests, demand, licensing) - level of automation available, or otherwise the manual process used to merge contributions - dependency matrix management (e.g. an item depends on malhar 3.5.0 minimum) - guidelines for adding items to the registry to be followed by contributors                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <a href="https://issues.apache.org/jira/browse/APEXCORE-576">https://issues.apache.org/jira/browse/APEXCORE-576</a> |
| 20178 | APEXCORE-576 | I had the same concerns as [~ananthg.apex] and I agree that having this registry can dilute the quality and the Apex story as a rich ecosystem. Also the stated goal is to help/facilitate external contributions to Apex but how will the registry help with that goal?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <a href="https://issues.apache.org/jira/browse/APEXCORE-576">https://issues.apache.org/jira/browse/APEXCORE-576</a> |
| 20179 | APEXCORE-570 | From the JIRA description, this sounds like a combination of backpressure with configurable limit on the queue. For the intra-process case the queue capacity can be set. For buffer server, it will spill over to disk, hence the upstream operator will produce at the speed of spooling. Are you thinking of a capacity limit here?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="https://issues.apache.org/jira/browse/APEXCORE-570">https://issues.apache.org/jira/browse/APEXCORE-570</a> |
| 20180 | APEXCORE-570 | If the spooling capacity limit is reached, would the operator just get blocked? If so, wouldn't that solve the back pressure problem at least partially?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <a href="https://issues.apache.org/jira/browse/APEXCORE-570">https://issues.apache.org/jira/browse/APEXCORE-570</a> |

| #     | Requirement  | Questions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | URL                                                                                                                 |

| 20181 | APEXCORE-570 | Let's first address the process issue (it may warrant a separate discussion and additions to the contributor guidelines also). If you think there was a conclusion then this may indicate that there was offline discussion that isn't captured here or anywhere else. Just by looking at this ticket it is everything but clear what lead to your PR. This is not how the community can work, discussion has to be in the open. Now back to the topic: I think this is a good approach. It will avoid the fast producing operator running ahead at the speed of writing to disk indefinitely. With this we will not need to limit the spooling at all? What about the case where you have two subscribers (and those could be different operators) where one can keep up with the rate at which data is published and the other one may be slow, albeit maybe temporarily? This will slow down the fast subscriber and introduce latency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/APEXCORE-570">https://issues.apache.org/jira/browse/APEXCORE-570</a> |
| 20182 | APEXCORE-570 | I will go into the topic specific comments first and then address your concern about my approach with the process. "Now back to the topic: I think this is a good approach. It will avoid the fast producing operator running ahead at the speed of writing to disk indefinitely. With this we will not need to limit the spooling at all?" Correct, spooling limit is not needed. Spooling size limit as a mechanism for back pressure will not work because we do not know how much data will be generated between two commits (committed windows). Also since the checkpoint length is configurable we cannot set it to some "reasonable" high value. Hence, spooling size limit is something that would not be practical. "What about the case where you have two subscribers (and those could be different operators) where one can keep up with the rate at which data is published and the other one may be slow, albeit maybe temporarily? This will slow down the fast subscriber and introduce latency." Yes, you are correct, the slowest subscriber will slow down the publisher (unless it is parallel partition all the way through). But, this is expected isn't it with back pressure. "Let's first address the process issue (it may warrant a separate discussion and additions to the contributor guidelines also). If you think there was a conclusion then this may indicate that there was offline discussion that isn't captured here or anywhere else. Just by looking at this ticket it is everything but clear what lead to your PR. This is not how the community can work, discussion has to be in the open." I think you have misunderstood my approach. When I created the JIRA, that started the discussion, I was facing a problem with a production application and had proposed using window difference as the way to create the back pressure and block publisher. Limiting spooling was suggested as an approach by both you and David and in my comment on 02nd Nov 16th at 22:53 I mentioned that it won't work because it will cause a deadlock. David's had another comment on this approach about suspending publisher on pool limit till committed which is effectively the same deadlock problem as the commit will not happen till publisher moves forward. There were no other approaches suggested so I proceeded with attempting to solve the problem via the proposed window difference approach. As I got into the weeds of the implementation and figured out all the details of how the current implementation works, I figured that instead of a window difference using the block difference was a better way to accomplish this. To me, the fundamental approach I originally suggested of blocking publisher till subscriber caught up hadn't changed rather an implementation detail. Second, the majority of the time during the implementation was spent in how to accomplish the task with the original assumption of window difference and coming to the conclusion to use blocks instead of windows and the actual coding a day or two so what you see in the PR is a relatively new discovery. In your comments, you have made a couple of statements, first that there may have been offline discussions on the implementation. This has not happened, I assure you. You are all seeing the implementation at the same time including the reviewers. The second statement is stronger about this being detrimental to community and discussions have to be open. I take personal offense to this statement. I know you want the best for the community but suggest you ascertain the truth before making such strong statements. | <a href="https://issues.apache.org/jira/browse/APEXCORE-570">https://issues.apache.org/jira/browse/APEXCORE-570</a> |
| 20183 | APEXCORE-565 | When will inactive operators be activated? Are there automation use cases where operators (and streams) will be activated based on a condition/event that happens in the application itself?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="https://issues.apache.org/jira/browse/APEXCORE-565">https://issues.apache.org/jira/browse/APEXCORE-565</a> |
| 20184 | APEXCORE-536 | So can we add anything that is new after 2.2 or we should stay backward compatible?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <a href="https://issues.apache.org/jira/browse/APEXCORE-536">https://issues.apache.org/jira/browse/APEXCORE-536</a> |
| 20185 | APEXCORE-536 | When are we planning to upgrade? We can right away use, application tags feature. I think we don't have to worry about backward compatibility. If the users are still using Hadoop 2.2, then they should be happy with Apex 3.4 ( or 3.5 ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <a href="https://issues.apache.org/jira/browse/APEXCORE-536">https://issues.apache.org/jira/browse/APEXCORE-536</a> |

Our People that help with the project in any of the above categories or other ways are contributors. See the [roles](http://www.apache.org/foundation/how-it-works.html#roles) as defined by the ASF. Community members that make sustained, welcome contributions to the project may be invited to become a [committer](/people.html). -## Code Style +## Before coding: One time Setup + +### JIRA + +Apache JIRA is used for issue tracking. If you do not already have an Apache JIRA account, sign up [here](https://issues.apache.org/jira/). Note that the user name should have no white spaces or other special characters that complicate auto-completion within JIRA comments etc. + +Please use a single JIRA account only (don't create multiple with different email addresses) to retain the issue history. Please use a permanent email address, for an existing account it can be changed in the profile. If you absolutely have to change your user name, contact INFRA. + +Apex has 2 JIRA projects: + +1. [APEXCORE](https://issues.apache.org/jira/browse/APEXCORE/) for [apex-core](https://github.com/apache/apex-core) and [apex-site](https://github.com/apache/apex-site) +2. [APEXMALHAR](https://issues.apache.org/jira/browse/APEXMALHAR/) for [apex-malhar](https://github.com/apache/apex-malhar) + +Before working on changes for any of the repositories, please locate an existing JIRA ticket or submit a new one. In order to assign an issue to yourself, you need to be listed as contributor in the JIRA project. PMC members have access to add new contributors, please request to be added through a comment on the candidate ticket. --- End diff -- Rather than adding a comment on tkt, should we ask new contributor to send a mail to dev@apex for contributor access. That way, the PMC/Committers can follow up with new contributor and help the person if required. This way, he/she gets introduced to the community at the same time, existing community members gets chance to give new contributors next step.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <a href="https://issues.apache.org/jira/browse/APEXCORE-534">https://issues.apache.org/jira/browse/APEXCORE-534</a> |
| 20187 | APEXCORE-526 | Can you please provide information on how to maintain this. Where is the configuration, how do we add new branches as part of the release process (may need to add relevant info to <a href="http://apex.apache.org/release.html">http://apex.apache.org/release.html</a> )? Also, will commits to respective branches trigger the build?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <a href="https://issues.apache.org/jira/browse/APEXCORE-526">https://issues.apache.org/jira/browse/APEXCORE-526</a> |
| 20188 | APEXCORE-526 | It would be good to document what we have for Malhar so that others can add the branches when needed. I would like to make this part of the upcoming 3.6 release. Would it be (later) possible to generate the user docs with this process also?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <a href="https://issues.apache.org/jira/browse/APEXCORE-526">https://issues.apache.org/jira/browse/APEXCORE-526</a> |
| 20189 | APEXCORE-526 | Can it be setup to build whenever there are commits pushed to branches? That would be better than scheduling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="https://issues.apache.org/jira/browse/APEXCORE-526">https://issues.apache.org/jira/browse/APEXCORE-526</a> |

| 20190 | APEXCORE-526 | There seems to be part of the documentation missing. Are you building it with -Pall-modules ?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/APEXCORE-526">https://issues.apache.org/jira/browse/APEXCORE-526</a> |
| 20191 | APEXCORE-526 | What's missing ? After adding that option what should I look for ?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="https://issues.apache.org/jira/browse/APEXCORE-526">https://issues.apache.org/jira/browse/APEXCORE-526</a> |
| 20192 | APEXCORE-518 | Do you mean to change parent pom to use the newer version of Apache parent pom? IMO, upgrading parent pom to the newer Apache version should be done in a separate commit. Changes to the codestyle-config pom.xml are completely independent. Changes to shaded-ning will require publishing new shaded-ning version.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <a href="https://issues.apache.org/jira/browse/APEXCORE-518">https://issues.apache.org/jira/browse/APEXCORE-518</a> |
| 20193 | APEXCORE-518 | I don't see why. Changing the code and releasing are separate. The whole reason I asked for a separate JIRA as that this Apex repository should not use different ASF parent poms for no obvious reason. It is the parent pom change (not the version) that has nothing to do with checkstyle and is not even needed to publish a new version of the code style artifact.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <a href="https://issues.apache.org/jira/browse/APEXCORE-518">https://issues.apache.org/jira/browse/APEXCORE-518</a> |
| 20194 | APEXCORE-514 | [~thw] I agree with you.. Some more change as suggested by you are required. I also have some suggestions about website updates. Would it make sense to start a thread on dev@apex about this? Otherwise, I can provide my suggestions here too.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/APEXCORE-514">https://issues.apache.org/jira/browse/APEXCORE-514</a> |
| 20195 | APEXCORE-510 | What classes overwrite DefaultOutputPort.setup()?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <a href="https://issues.apache.org/jira/browse/APEXCORE-510">https://issues.apache.org/jira/browse/APEXCORE-510</a> |
| 20196 | APEXCORE-498 | [~sandesh] this is a good feature to have, it enables reprocessing. Can you outline how it will work, without getting into code details for now. Specifically, there are different areas where state is tracked (master, buffer servers, operator state, external systems). How will this play with all of those? Please consider end-to-end exactly once and see if and how the proposed names checkpoints (also referred to as safe-points?) will fit in?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://issues.apache.org/jira/browse/APEXCORE-498">https://issues.apache.org/jira/browse/APEXCORE-498</a> |
| 20197 | APEXCORE-498 | Discussed this with [~davidyan] & [~PramodSSImmaneni]. There was a concern that to use this feature properly a lot of effort is required beyond this feature. Existing Operators that use WindowDataManager won't work properly with this feature, they have to be made SavePoint compatible. What is your take on this [~thomasWeise] ?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <a href="https://issues.apache.org/jira/browse/APEXCORE-498">https://issues.apache.org/jira/browse/APEXCORE-498</a> |
| 20198 | APEXCORE-498 | I think this is an important feature that should be supported. It needs to be designed properly, so I was actually expecting a design level discussion that is visible to everyone. There will of course be changes needed to existing components and there will also be limitations that pertain to external systems that need to be understood and discussed. Why should operators that use WindowDataManager not work?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <a href="https://issues.apache.org/jira/browse/APEXCORE-498">https://issues.apache.org/jira/browse/APEXCORE-498</a> |
| 20199 | APEXCORE-496 | We support shared stats listener, But user do not have any way to identify the operator for which the stat listener is called. The BatchedOperatorStats only provides operatorId, and there is no api available to use to get operator information from operatorId. Can we include operator name as part of BatchedOperatorStats? This will allow users to take decision based on which operator stats are being processed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://issues.apache.org/jira/browse/APEXCORE-496">https://issues.apache.org/jira/browse/APEXCORE-496</a> |

| 20212 | APEXCORE-482 | Why is Mx1 special ?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="https://issues.apache.org/jira/browse/APEXCORE-482">https://issues.apache.org/jira/browse/APEXCORE-482</a> |
| 20213 | APEXCORE-482 | Github user vrosov commented on the issue: <a href="https://github.com/apache/apex-core/pull/358">https://github.com/apache/apex-core/pull/358</a> What is the reason unifier does not have it's own StreamMeta? IMO,<br>it will be better to introduce separate StreamMeta for unifiers instead of the locality field that is used only for unifiers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <a href="https://issues.apache.org/jira/browse/APEXCORE-482">https://issues.apache.org/jira/browse/APEXCORE-482</a> |

| 20215 | APEXCORE-475 | We can implement part of your suggestion now, that is to include DataTorrent & ApacheApex while retrieving. Then in the 4.0 we can rename the category to ApacheApex. By doing this we can avoid the problem during development that can happen at a later point as well. What say?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="https://issues.apache.org/jira/browse/APEXCORE-475">https://issues.apache.org/jira/browse/APEXCORE-475</a> |
| 20216 | APEXCORE-475 | Please see discussion on the PR. Do you have examples for other application types?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="https://issues.apache.org/jira/browse/APEXCORE-475">https://issues.apache.org/jira/browse/APEXCORE-475</a> |
| 20217 | APEXCORE-467 | What's the problem with having the buffer server in each container? Does it allocate resources that are not used?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <a href="https://issues.apache.org/jira/browse/APEXCORE-467">https://issues.apache.org/jira/browse/APEXCORE-467</a> |

If the authentication is successful the proxy forwards the request to STRAM. STRAM in processing the request generates and send back a web service token similar to a delegation token. This token is then used by client in subsequent requests it makes directly to STRAM and STRAM is able to validate it since it generated the token in the first place. --- End diff -- This token is then used by (add **the***) client                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <a href="https://issues.apache.org/jira/browse/APEXCORE-457">https://issues.apache.org/jira/browse/APEXCORE-457</a> |

It looks like it's changing the intention of the original code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <a href="https://issues.apache.org/jira/browse/APEXCORE-451">https://issues.apache.org/jira/browse/APEXCORE-451</a> |
| 20225 | APEXCORE-448 | There is another attribute of such read-only ilk, IS_OUTPUT_UNIFIED on PortContext. The read-only behavior is not enforced by the platform but user changing it has no effect. However, in this case, it might be confusing for user to see a method in DAG to add operator with a name and an operator attribute NAME. How about calling the method getOperatorName() to be more specific. Do you want to propose it on dev or would you like me to?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <a href="https://issues.apache.org/jira/browse/APEXCORE-448">https://issues.apache.org/jira/browse/APEXCORE-448</a> |

How long will it take to remove an extra operator? How long will it take to modify test not to rely on aggregate? It is a small test and it is not necessary to make it more complex than it needs to be. I suggest that we stop discussion on "nitpicking" and "hard time" on the PR and use it only to discuss code changes. </pre> | <a href="https://issues.apache.org/jira/browse/APEXCORE-448">https://issues.apache.org/jira/browse/APEXCORE-448</a> |

At the end both will throw an exception. If that exception does not lead to test failure, why +            'Preconditions.checkNotNull' is necessary? +            Why modifications to operatorName on operator thread will be immediately visible on the main thread? </pre> | <a href="https://issues.apache.org/jira/browse/APEXCORE-448">https://issues.apache.org/jira/browse/APEXCORE-448</a> |
| 20243 | APEXCORE-448 | <p>Github user PramodSSimmaneni commented on the issue: <a href="https://github.com/apache/apex-core/pull/364">https://github.com/apache/apex-core/pull/364</a> I second it, please reopen this PR and I will merge it. I think we have spent enough time on the tests and everyone's inputs have been valuable. There will be other opportunities in future to add more tests and refactor them. My only small concern is adding a dependency to OperatorDeployInfo in OperatorContext, can we completely justify that? I liked the earlier way where @chandnisingh was passing the extra name as well, null check or without works for me.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <a href="https://issues.apache.org/jira/browse/APEXCORE-448">https://issues.apache.org/jira/browse/APEXCORE-448</a> |
| 20244 | APEXCORE-426 | <p>Adding an answer to the question asked by [~PramodSSimmaneni] Q: Just for completeness can you explain on the JIRA what happens if there were plan changes that were saved but before stram could affect them it got shutdown. Will the new instance make those changes. A: When a Stram recovers, it will use the last checkpointed plan, if the running containers are any different from the expected plan, following things will happen 1. Containers unknown to Stram are killed/rejected 2. Containers which are not responding will be rescheduled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <a href="https://issues.apache.org/jira/browse/APEXCORE-426">https://issues.apache.org/jira/browse/APEXCORE-426</a> |
| 20245 | APEXCORE-426 | How long will it take for 2. to happen? | 20251 | APEXCORE-408 | How about widening the scope to also trigger the changes when major events happen in the execution such as operators getting killed or choosing to shutdown? In general whenever a stram event gets created we could potentially trigger the changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="https://issues.apache.org/jira/browse/APEXCORE-408">https://issues.apache.org/jira/browse/APEXCORE-408</a> |

| 20253 | APEXCORE-405 | Github user twice commented on the issue: <a href="https://github.com/apache/apex-core/pull/351">https://github.com/apache/apex-core/pull/351</a> Before getting into details, how will packaging and configuration related aspects be handled when using the proposed API? In embedded mode all of that is implied, but for launching an app on the YARN cluster the configuration is critical. The CLI expects an app package and sources configuration from different locations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <a href="https://issues.apache.org/jira/browse/APEXCORE-405">https://issues.apache.org/jira/browse/APEXCORE-405</a> |

| 20255 | APEXCORE-405 | Github user twice commented on the issue: <a href="https://github.com/apache/apex-core/pull/351">https://github.com/apache/apex-core/pull/351</a> @PramodSSImmaneni Parity with embedded mode is not sufficient. Launching an application on a YARN cluster is very different and needs to be considered accordingly. How does the user figure out what the dependencies are, how will the configuration object be put together?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <a href="https://issues.apache.org/jira/browse/APEXCORE-405">https://issues.apache.org/jira/browse/APEXCORE-405</a> |

| 20258 | APEXCORE-401 | Github user vrozov commented on the pull request: <a href="https://github.com/apache/incubator-apex-core/pull/290#issuecomment-204434631">https://github.com/apache/incubator-apex-core/pull/290#issuecomment-204434631</a> Is it necessary to have a separate artifactId for codestyle and publish it to apache maven? Can the same goal be achieved by uploading codestyle definition file to a central location? For item 1, should checkstyle module be moved into a separate project?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <a href="https://issues.apache.org/jira/browse/APEXCORE-401">https://issues.apache.org/jira/browse/APEXCORE-401</a> |

| 20260 | APEXCORE-401 | Github user chandnisingh commented on the pull request: <a href="https://github.com/apache/incubator-apex-core/pull/290#issuecomment-204581927">https://github.com/apache/incubator-apex-core/pull/290#issuecomment-204581927</a> @tweise @vrozov ok. does that mean that I right now I can't change the main apex pom.xml to use the new artifact as it is not present at the maven central repo. Only once the new artifact is available there, then I can modify the apex pom?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/APEXCORE-401">https://issues.apache.org/jira/browse/APEXCORE-401</a> |

Can we do a better heuristic. We can have another timeout setting (which is less than streaming window size) where we continue to do busy way till that timeout and if there is no data till then, then initiate the stepwise sleep.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <a href="https://issues.apache.org/jira/browse/APEXCORE-380">https://issues.apache.org/jira/browse/APEXCORE-380</a> |
| 20267 | APEXCORE-378 | [Yogi] Hi, I studied source code, docs related to windowing for my presentation on "Windowing in Apex". After going through the phase of learning, teaching apex windowing concepts to others; I realized that attribute APPLICATION_WINDOW_COUNT from OperatorContext should have better name. Because: 1. From the name it looks like a attribute of the APPLICATION; but actually it is an Operator attribute. 2. It is very confusing to say that APPLICATION_WINDOW_COUNT can be different for different Operators within an Application. Can we have some better name for this attribute? Any suggestions for the new name? I propose following names: 1. OPERATOR_WINDOW_COUNT 2. OPERATOR_WINDOW_SPAN I understand that, introducing new name to the existing attribute might break backward compatibility. But, we can deal with that by deprecating the older name and keeping it alive till next major release. What is your opinion on this?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <a href="https://issues.apache.org/jira/browse/APEXCORE-378">https://issues.apache.org/jira/browse/APEXCORE-378</a> |

How does that work? Communication needs to be on the mailing list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <a href="https://issues.apache.org/jira/browse/APEXCORE-354">https://issues.apache.org/jira/browse/APEXCORE-354</a> |
| 20269 | APEXCORE-354 | <p>Github user sashadt commented on the pull request: <a href="https://github.com/apache/incubator-apex-site/pull/14#issuecomment-194001421">https://github.com/apache/incubator-apex-site/pull/14#issuecomment-194001421</a> @chinmaykolhatkar What makes something a forum is ability to discuss the topic. However, if this discussion never makes it back to dev@ or user@ mailing lists, then we have a problem. Are you saying Nabble takes care of sending the communication back via shared mailing lists? That's what I'm trying to confirm.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <a href="https://issues.apache.org/jira/browse/APEXCORE-354">https://issues.apache.org/jira/browse/APEXCORE-354</a> |

On Thu, Feb 11, 2016 at 4:20 PM, Pramod Immaneni &lt;pramod@datatorrent.com&gt; wrote: &gt; Comments inline &gt; &gt; On Thu, Feb 11, 2016 at 4:13 PM, Timothy Farkas &lt;tim@datatorrent.com&gt; &gt; wrote: &gt; &gt; Hey Pramod, &gt; &gt; &gt; I agree if APEX-339 is in place then it would work without redeploying &gt; &gt; containers for operators that are Stateless, or a subset of Stateful &gt; &gt; operators. &gt; &gt; &gt; Addressing your previous questions. &gt; &gt; &gt; - The StatsListener can be used to see how far behind operators are. You &gt; &gt; could determine what window the operator is on, or the number of tuples &gt; &gt; it's processed so far, or how long &gt; &gt; it takes it to complete a window. &gt; &gt; &gt; What if tuples are different sizes and number of tuples processed doesn't &gt; reflect how far ahead or behind a downstream partition is? How is the &gt; information from StatsListener made available to the upstream partition &gt; codecs. &gt; What is the information Buffer Server can provide that the StatsListener cannot? The stats information would have to be relayed down to the upstream operators. It's possible. The StatsListener can trigger a repartition. The information in the StatsListener can be shared with the partitioner by setting the same object for both in populate Dag. The partitioner can then compute the new Stream Codec. The mechanism by which the upstream would be updated with the new Stream Codec would have to be implemented as it's currently not there. &gt; &gt; &gt; &gt; - Some examples of Stateful operators that require repartitioning of &gt; state &gt; &gt; are the following: &gt; &gt; - Deduper &gt; &gt; In this case after updating the stream codec the operator may &gt; &gt; allow a previously seen value to pass because the partition didn't &gt; receive &gt; &gt; that value with the previous stream codec. &gt; &gt; - A key value store that holds aggregations for each key. &gt; &gt; In this case multiple partitions would hold partial &gt; aggregations &gt; &gt; for a key, when they are expecting to hold the complete aggregation. &gt; &gt; &gt; Agreed for deduper. For the second case a unifier is a better approach so &gt; that you are not affected by key skew in general. &gt; This is not always possible. We can discuss this offline, since it won't add much to the discussion here to go into the details. Yes not always.</p> | <a href="https://issues.apache.org/jira/browse/APEXCORE-348">https://issues.apache.org/jira/browse/APEXCORE-348</a> |

| 20273 | APEXCORE-347 | <p>Github user twice commented on the pull request: <a href="https://github.com/apache/incubator-apex-core/pull/226#issuecomment-184961199">https://github.com/apache/incubator-apex-core/pull/226#issuecomment-184961199</a> Looks good. How about waiting with this PR until semver option in the plugin is available?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="https://issues.apache.org/jira/browse/APEXCORE-347">https://issues.apache.org/jira/browse/APEXCORE-347</a> |
| 20274 | APEXCORE-344 | <p>Shutdown takes a while to finish. Can you please file a jira with your observation?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/APEXCORE-344">https://issues.apache.org/jira/browse/APEXCORE-344</a> |
| 20275 | APEXCORE-340 | <p>Besides the symlink, the proper name change would involve: - Change the name of DTCLI class to ApexCli - Change the prompt from dt&gt; to apex&gt; - Change the initial greeting when running the CLI from something like "DT CLI 3.3.0-incubating ..." to "Apex CLI ...". Although the above will break existing 3rd party scripts that rely on the string "DT", the existence of such scripts is unlikely. What do people think if we actually make those changes without waiting for the major version bump?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <a href="https://issues.apache.org/jira/browse/APEXCORE-340">https://issues.apache.org/jira/browse/APEXCORE-340</a> |
| 20276 | APEXCORE-340 | <p>Hmm. How will it break the yahoo benchmark if we retain dtcli as a symlink?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <a href="https://issues.apache.org/jira/browse/APEXCORE-340">https://issues.apache.org/jira/browse/APEXCORE-340</a> |

| 20277 | APEXCORE-340 | Made following changes in my fork: <a href="https://github.com/chinmaykolhatkar/incubator-apex-core/tree/APEXCORE-340">https://github.com/chinmaykolhatkar/incubator-apex-core/tree/APEXCORE-340</a> 1. Script name changed to apex. Created dtcli as symlink to apex 2. Class name changed to ApexCli from DTCLI. Similar for test class. 3. Changed console prompt to "apex>" from "dt>" 4. Changed Welcome message to "Apex CLI ..." from "DT CLI ..." Commit link is: <a href="https://github.com/chinmaykolhatkar/incubator-apex-core/commit/5ef35e83323504027aef115dd01f7278c69cb1c1">https://github.com/chinmaykolhatkar/incubator-apex-core/commit/5ef35e83323504027aef115dd01f7278c69cb1c1</a> Verified with unit test and launching pi demo. Before I create a PR, I have some questions: 1. [~sandesh] : Even though there is dtcli symlink to apex, the prompt of the cli will change to "apex>" from "dtcli>"... Would that cause any problem in yahoo streaming benchmark? 2. [~davidyan] [~thw] : We There are still traces of "dt" all over in this. For eg. ".dt" folder, DT_CLASSPATH and other such variables in script. Should those also be changed as a part of this?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="https://issues.apache.org/jira/browse/APEXCORE-340">https://issues.apache.org/jira/browse/APEXCORE-340</a> |

It could be a flag in the json.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="https://issues.apache.org/jira/browse/APEXCORE-330">https://issues.apache.org/jira/browse/APEXCORE-330</a> |
| 20283 | APEXCORE-330 | I noticed that the individual containers are sending a JSON serialized string of the stack trace information to STRAM. The serialization is typically handled by RPC and the containers just send objects. Could you convert the Map<Thread, StackTraceElement[]> into an object that can be serialized, maybe into a Map<ThreadInfo, StackTraceElement[]>. Secondly the web service call results in a request flag to be set in the container agent which gets reset immediately after initiating a request to the container to send the stack trace. I believe this flag should be reset after receiving the stack trace from the container as there is a chance the request may not make it to the container if there are any intermittent network errors and the web service call is anyway waiting for a timeout period of 10s for the stack trace which is several heartbeats. I apologize I was not able to give these comments during the pull request review.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/APEXCORE-330">https://issues.apache.org/jira/browse/APEXCORE-330</a> |
| 20284 | APEXCORE-328 | Found the following message in the 'screen.txt' that may explain why maven invocation from the unit test fails: {noformat} Error: Could not find or load main class org.codehaus.plexus.classworlds.launcher.Launcher {noformat}                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <a href="https://issues.apache.org/jira/browse/APEXCORE-328">https://issues.apache.org/jira/browse/APEXCORE-328</a> |
| 20285 | APEXCORE-327 | Can you please make the equivalent change for the release-3.3 branch? Also, is there a way to automate this, i.e. have it find out automatically based on the version number that modifications are not allowed (if the version is not X.Y.0, then enable the constraint)? Or is this an enhancement for the plugin?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://issues.apache.org/jira/browse/APEXCORE-327">https://issues.apache.org/jira/browse/APEXCORE-327</a> |

| 20287 | APEXCORE-321 | <p>Github user chinmaykolhatkar commented on a diff in the pull request: <a href="https://github.com/apache/incubator-apex-site/pull/22#discussion_r56286607">https://github.com/apache/incubator-apex-site/pull/22#discussion_r56286607</a> --- Diff: src/md/bylaws.md --- @@ -0,0 +1,381 @@ +**** draft subject to top level project approval *** +##Apache Apex Project Bylaws + +This document defines the bylaws under which the Apache Apex project operates. It +defines the roles and responsibilities of the project, who may vote, how voting works, +how conflicts are resolved, etc. + +Apex is a project of the &lt;a class="externalLink" href= + "http://www.apache.org/foundation/"&gt;Apache Software Foundation&lt;/a&gt;. The Foundation +holds the copyright on Apache code including the code in the Apex codebase. The +&lt;a class="externalLink" href="http://www.apache.org/foundation/faq.html"&gt;Foundation +FAQ&lt;/a&gt; explains the operation and background of the foundation. + +Apex is typical of Apache projects in that it operates under a set of principles, +known collectively as the "Apache Way". If you are new to Apache +development, please refer to the &lt;a class="externalLink" href= + "http://incubator.apache.org/"&gt;Incubator project&lt;/a&gt; for more information on how Apache +projects operate. + +##Roles and Responsibilities + +Apache projects define a &lt;a class="externalLink" href= + "http://www.apache.org/foundation/how-it-works.html#roles"&gt;set of roles&lt;/a&gt; with +associated rights and responsibilities. These roles govern what tasks an individual +may perform within the project. The roles are defined in the following sections: + +###Users + +The most important participants in the project are people who use our software. +The majority of our developers start out as users and guide their development +efforts from the user's perspective. + +Users contribute to the Apache projects by providing feedback to developers in +the form of bug reports and feature suggestions. As well, users participate in the +Apache community by helping other users on mailing lists and user support +forums. + +###Contributors + +All of the volunteers who are contributing time, code, documentation, or +resources to the Apex Project. A contributor that makes sustained, welcome +contributions to the project may be invited to become a Committer, though the exact +timing of such invitations depends on many factors. + +###Committers + +The project's Committers are responsible for the project's technical +management. All committers have write access to the project's source +repositories. Committers may cast binding votes on any technical discussion --- End diff -- I was under impression that PPMC members have binding votes. Is this changed?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <a href="https://issues.apache.org/jira/browse/APEXCORE-321">https://issues.apache.org/jira/browse/APEXCORE-321</a> |
| 20288 | APEXCORE-321 | <p>src/md/bylaws.md --- @@ -0,0 +1,381 @@ +**** draft subject to top level project approval *** +##Apache Apex Project Bylaws + +This document defines the bylaws under which the Apache Apex project operates. It +defines the roles and responsibilities of the project, who may vote, how voting works, +how conflicts are resolved, etc. + +Apex is a project of the &lt;a class="externalLink" href= + "http://www.apache.org/foundation/"&gt;Apache Software Foundation&lt;/a&gt;. The Foundation +holds the copyright on Apache code including the code in the Apex codebase. The +&lt;a class="externalLink" href="http://www.apache.org/foundation/faq.html"&gt;Foundation +FAQ&lt;/a&gt; explains the operation and background of the foundation. + +Apex is typical of Apache projects in that it operates under a set of principles, +known collectively as the "Apache Way". If you are new to Apache +development, please refer to the &lt;a class="externalLink" href= + "http://incubator.apache.org/"&gt;Incubator project&lt;/a&gt; for more information on how Apache +projects operate. + +##Roles and Responsibilities + +Apache projects define a &lt;a class="externalLink" href= + "http://www.apache.org/foundation/how-it-works.html#roles"&gt;set of roles&lt;/a&gt; with +associated rights and responsibilities. These roles govern what tasks an individual +may perform within the project. The roles are defined in the following sections: + +###Users + +The most important participants in the project are people who use our software. +The majority of our developers start out as users and guide their development +efforts from the user's perspective. + +Users contribute to the Apache projects by providing feedback to developers in +the form of bug reports and feature suggestions. As well, users participate in the +Apache community by helping other users on mailing lists and user support +forums. + +###Contributors + +All of the volunteers who are contributing time, code, documentation, or +resources to the Apex Project. A contributor that makes sustained, welcome +contributions to the project may be invited to become a Committer, though the exact +timing of such invitations depends on many factors. + +###Committers + +The project's Committers are responsible for the project's technical +management. All committers have write access to the project's source +repositories. Committers may cast binding votes on any technical discussion +regarding the project. + +Committer access is by invitation only and must be approved by lazy consensus of +the active PMC members. A Committer may request removal of their commit privileges +by their own declaration. A committer will be considered +&amp;ldquo;emeritus/inactive&amp;rdquo; by not contributing in any form to the project for +over 1 year. An emeritus committer may request reinstatement of commit access from +the PMC. Such reinstatement is subject to lazy consensus of active PMC members + +Commit access can be revoked by a unanimous vote of all the active PMC members +(except the committer in question if they are also a PMC member). + +All Apache committers are required to have a signed Contributor License +Agreement (&lt;a class="externalLink" href= + "http://www.apache.org/licenses/icla.txt"&gt;CLA&lt;/a&gt;) on file with the Apache Software +Foundation. There is a &lt;a class="externalLink" href= + "http://www.apache.org/dev/committers.html"&gt;Committer FAQ&lt;/a&gt; which provides more +details on the requirements for Committers + +A committer who makes a sustained contribution to the project may be invited to +become a member of the PMC. The form of contribution is not limited to code. It can +also include code review, helping out users on the mailing lists, documentation, +etc. + +###Project Management Committee + +The Project Management Committee (PMC) for Apache Apex was created by a +resolution of the board of the Apache Software Foundation on ***TBD***. The +PMC is responsible to the board and the ASF for the management and oversight of the +Apache Apex codebase. The responsibilities of the PMC include: + +* Deciding what is distributed as products of the project. In particular all releases must be approved by the PMC +*</p> | <a href="https://issues.apache.org/jira/browse/APEXCORE-321">https://issues.apache.org/jira/browse/APEXCORE-321</a> |

| 20293 | APEXCORE-321 | <p>src/md/bylaws.md --- @@ -0,0 +1,381 @@ +### draft subject to top level project approval *** +Apache Apex Project Bylaws + +This document defines the bylaws under which the Apache Apex project operates. It +defines the roles and responsibilities of the project, who may vote, how voting works, +how conflicts are resolved, etc. + +Apex is a project of the &lt;a class="externalLink" href= + "http://www.apache.org/foundation/"&gt;Apache Software Foundation&lt;/a&gt;. The Foundation +holds the copyright on Apache code including the code in the Apex codebase. The +&lt;a class="externalLink" href="http://www.apache.org/foundation/faq.html"&gt;Foundation +FAQ&lt;/a&gt; explains the operation and background of the foundation. + +Apex is typical of Apache projects in that it operates under a set of principles, +known collectively as the "Apache Way". If you are new to Apache +development, please refer to the &lt;a class="externalLink" href= + "http://incubator.apache.org/"&gt;Incubator project&lt;/a&gt; for more information on how Apache +projects operate. + +### Roles and Responsibilities + +Apache projects define a &lt;a class="externalLink" href= + "http://www.apache.org/foundation/how-it-works.html#roles"&gt;set of roles&lt;/a&gt; with +associated rights and responsibilities. These roles govern what tasks an individual +may perform within the project. The roles are defined in the following sections: + +### Users + +The most important participants in the project are people who use our software. +The majority of our developers start out as users and guide their development +efforts from the user's perspective. + +Users contribute to the Apache projects by providing feedback to developers in +the form of bug reports and feature suggestions. As well, users participate in the +Apache community by helping other users on mailing lists and user support +forums. + +### Contributors + +All of the volunteers who are contributing time, code, documentation, or +resources to the Apex Project. A contributor that makes sustained, welcome +contributions to the project may be invited to become a Committer, though the exact +timing of such invitations depends on many factors. + +### Committers + +The project's Committers are responsible for the project's technical +management. All committers have write access to the project's source +repositories. Committers may cast binding votes on any technical discussion +regarding the project. + +Committer access is by invitation only and must be approved by lazy consensus of +the active PMC members. A Committer may request removal of their commit privileges +by their own declaration. A committer will be considered +&amp;ldquo;emeritus/inactive&amp;rdquo; by not contributing in any form to the project for +over 1 year. An emeritus committer may request reinstatement of commit access from +the PMC. Such reinstatement is subject to lazy consensus of active PMC members + +Commit access can be revoked by a unanimous vote of all the active PMC members +(except the committer in question if they are also a PMC member). + +All Apache committers are required to have a signed Contributor License +Agreement (&lt;a class="externalLink" href= + "http://www.apache.org/licenses/icla.txt"&gt;CLA&lt;/a&gt;) on file with the Apache Software +Foundation. There is a &lt;a class="externalLink" href= + "http://www.apache.org/dev/committers.html"&gt;Committer FAQ&lt;/a&gt; which provides more +details on the requirements for Committers + +A committer who makes a sustained contribution to the project may be invited to +become a member of the PMC. The form of contribution is not limited to code. It can +also include code review, helping out users on the mailing lists, documentation, +etc. + +### Project Management Committee + +The Project Management Committee (PMC) for Apache Apex was created by a +resolution of the board of the Apache Software Foundation on ***TBD***. The +PMC is responsible to the board and the ASF for the management and oversight of the +Apache Apex codebase. The responsibilities of the PMC include: + +* Deciding what is distributed as products of the project. In particular all releases must be approved by the PMC +*</p>                                                                                                 | <a href="https://issues.apache.org/jira/browse/APEXCORE-321">https://issues.apache.org/jira/browse/APEXCORE-321</a> |

The different types of compatibility between Apex releases that affect contributors, downstream projects, and end-users are enumerated. For each type of compatibility we: + +* describe the impact on downstream projects or end-users +* where applicable, call out the policy adopted when incompatible changes are permitted. + +Apache Apex follows [semantic versioning](http://semver.org/). Depending in the compatibility type, there may be different tools or mechanisms to ensure compatibility, for example by comparing artifacts during the build process. + +The type of change will inform the required target version number. Given a version number MAJOR.MINOR.PATCH, increment the: + +* MAJOR version when you make incompatible API changes, +* MINOR version when you add functionality in a backwards-compatible manner, and +* PATCH version when you make backwards-compatible bug fixes. + +Additional labels for pre-release and build metadata are available as extensions to the MAJOR.MINOR.PATCH format. + +The overall goal is to avoid backward incompatible changes and major release upgrades. Accordingly we attempt to release new features with minor versions that are incremental to the prior release and offer our users a frictionless upgrade path. When planning contributions, please consider compatibility and release road map upfront. Specifically, certain changes that conflict with the versioning may need to be documented in JIRA and deferred until a future major release. + +### Compatibility types + +### Java API + +Public API compatibility is required to ensure end-user programs and downstream projects continue to work without modification. +The public API consists of: + +* apex-core: all interfaces and classes in 'api' and 'common' modules +* apex-malhar: all interfaces and classes in all modules except 'demos', 'samples', 'benchmark' + +Interfaces and classes that are part of the public API and are annotated with [interface stability](https://hadoop.apache.org/docs/stable/hadoop-project-dist/hadoop-common/InterfaceClassification.html) are treated according to the rules defined by the annotation. + +Policy + +Changes to the public API must follow semantic versioning. +Public APIs must be deprecated for at least one major release prior to their removal in a major release. +The japicmp plugin is used to enforce compatibility as part of the Travis pre-commit builds. + +### Semantic compatibility + +The behavior of APIs needs to remain consistent over versions, though changes for correctness may result in changes in behavior. Tests and javadocs specify the behavior. Over time, test suites should be expanded to verify compliance with the specification, effectively creating a formal specification for the subset of behaviors that can be easily tested. + +Policy + +The behavior of API may be changed to fix incorrect behavior, changes to be accompanied by tests coverage for the exact behavior. + +### REST API + +REST API compatibility corresponds to both the URLs and request/response content over the wire. REST APIs are specifically meant for stable use by clients across releases, even major releases. + +Policy + +The REST API is separately versioned. This is to allow for co-existence of old and new API should there be a need for backward incompatible changes in the future. + +### Command Line Interface (CLI) + +The CLI may be used either directly via the system shell or via shell scripts. Changing the path, removing or renaming command line options, the order of arguments, or the command return code and output break compatibility and may adversely affect users. + +Policy + +CLI commands are to be deprecated (warning when used) in a prior minor release before they are removed or incompatibly modified in a subsequent major release. --- End diff -- What are CLI commands not preserved for one major version in deprecated capacity like the APIs</p> | <a href="https://issues.apache.org/jira/browse/APEXCORE-319">https://issues.apache.org/jira/browse/APEXCORE-319</a> |

| 20295 | APEXCORE-319 | <p>src/md/compatibility.md --- @@ -0,0 +1,112 @@</p> <p>##Apache Apex Compatibility</p> <p>###Purpose</p> <p>+This document captures the compatibility goals of the Apache Apex project. The different types of compatibility between Apex releases that affect contributors, downstream projects, and end-users are enumerated. For each type of compatibility we:</p> <ul style="list-style-type: none"> <li>+ describe the impact on downstream projects or end-users</li> <li>+ where applicable, call out the policy adopted when incompatible changes are permitted.</li> </ul> <p>+Apache Apex follows [semantic versioning](http://semver.org/). Depending in the compatibility type, there may be different tools or mechanisms to ensure compatibility, for example by comparing artifacts during the build process.</p> <ul style="list-style-type: none"> <li>+The type of change will inform the required target version number. Given a version number MAJOR.MINOR.PATCH, increment the:</li> <li>+ MAJOR version when you make incompatible API changes,</li> <li>+ MINOR version when you add functionality in a backwards-compatible manner, and</li> <li>+ PATCH version when you make backwards-compatible bug fixes.</li> </ul> <p>+Additional labels for pre-release and build metadata are available as extensions to the MAJOR.MINOR.PATCH format.</p> <ul style="list-style-type: none"> <li>+The overall goal is to avoid backward incompatible changes and major release upgrades. Accordingly we attempt to release new features with minor versions that are incremental to the prior release and offer our users a frictionless upgrade path. When planning contributions, please consider compatibility and release road map upfront. Specifically, certain changes that conflict with the versioning may need to be documented in JIRA and deferred until a future major release.</li> </ul> <p>###Compatibility types</p> <ul style="list-style-type: none"> <li>####Java API</li> <li>+Public API compatibility is required to ensure end-user programs and downstream projects continue to work without modification.</li> <li>+The public API consists of:</li> <li>+ apex-core: all interfaces and classes in 'api' and 'common' modules</li> <li>+ apex-malhar: all interfaces and classes in all modules except 'demos', 'samples', 'benchmark'</li> <li>+Interfaces and classes that are part of the public API and are annotated with [interface stability](https://hadoop.apache.org/docs/stable/hadoop-project-dist/hadoop-common/InterfaceClassification.html) are treated according to the rules defined by the annotation.</li> <li>+Policy</li> <li>+Changes to the public API must follow semantic versioning.</li> <li>+Public APIs must be deprecated for at least one major release prior to their removal in a major release.</li> <li>+The japicmp plugin is used to enforce compatibility as part of the Travis pre-commit builds.</li> <li>####Semantic compatibility</li> <li>+The behavior of APIs needs to remain consistent over versions, though changes for correctness may result in changes in behavior. Tests and javadocs specify the behavior. Over time, test suites should be expanded to verify compliance with the specification, effectively creating a formal specification for the subset of behaviors that can be easily tested.</li> <li>+Policy</li> <li>+The behavior of API may be changed to fix incorrect behavior, changes to be accompanied by tests coverage for the exact behavior.</li> <li>####REST API</li> <li>+REST API compatibility corresponds to both the URLs and request/response content over the wire. REST APIs are specifically meant for stable use by clients across releases, even major releases.</li> <li>+Policy</li> <li>+The REST API is separately versioned. This is to allow for co-existence of old and new API should there be a need for backward incompatible changes in the future.</li> <li>####Command Line Interface (CLI)</li> <li>+The CLI may be used either directly via the system shell or via shell scripts. Changing the path, removing or renaming command line options, the order of arguments, or the command return code and output break compatibility and may adversely affect users.</li> <li>+Policy</li> <li>+CLI commands are to be deprecated (warning when used) in a prior minor release before they are removed or incompatibly modified in a subsequent major release.</li> <li>####Configuration Files</li> <li>+Configuration files are used for engine or application settings. Changes to keys and default values affect users.</li> <li>+Policy</li> <li>+Name, location, format, keys of configuration files should be deprecated in a prior minor release and can only be changed in major release. Best effort should be made to</li> </ul> | <a href="https://issues.apache.org/jira/browse/APEXCORE-319">https://issues.apache.org/jira/browse/APEXCORE-319</a> |

The different types of compatibility between Apex releases that affect contributors, downstream projects, and end-users are enumerated. For each type of compatibility we:</p> <ul style="list-style-type: none"> <li>+ describe the impact on downstream projects or end-users</li> <li>+ where applicable, call out the policy adopted when incompatible changes are permitted.</li> </ul> <p>+Apache Apex follows [semantic versioning](http://semver.org/). Depending in the compatibility type, there may be different tools or mechanisms to ensure compatibility, for example by comparing artifacts during the build process.</p> <p>--- End diff --</p> <p>Depending "on"?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://issues.apache.org/jira/browse/APEXCORE-319">https://issues.apache.org/jira/browse/APEXCORE-319</a> |

| #     | Requirement  | Questions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | URL                                                                                                                 |

| 20297 | APEXCORE-319 | <p>src/md/compatibility.md --- @@ -0,0 +1,112 @@ +#Apache Apex Compatibility + ###Purpose + +This document captures the compatibility goals of the Apache Apex project. The different types of compatibility between Apex releases that affect contributors, downstream projects, and end-users are enumerated. For each type of compatibility we: + * describe the impact on downstream projects or end-users +* where applicable, call out the policy adopted when incompatible changes are permitted. + +Apache Apex follows [semantic versioning](http://semver.org/). Depending in the compatibility type, there may be different tools or mechanisms to ensure compatibility, for example by comparing artifacts during the build process. + +The type of change will inform the required target version number. Given a version number MAJOR.MINOR.PATCH, increment the: + * MAJOR version when you make incompatible API changes, +* MINOR version when you add functionality in a backwards-compatible manner, and +* PATCH version when you make backwards-compatible bug fixes. + +Additional labels for pre-release and build metadata are available as extensions to the MAJOR.MINOR.PATCH format. + +The overall goal is to avoid backward incompatible changes and major release upgrades. Accordingly we attempt to release new features with minor versions that are incremental to the prior release and offer our users a frictionless upgrade path. When planning contributions, please consider compatibility and release road map upfront. Specifically, certain changes that conflict with the versioning may need to be documented in JIRA and deferred until a future major release. + ###Compatibility types + ####Java API + +Public API compatibility is required to ensure end-user programs and downstream projects continue to work without modification. +The public API consists of: + * apex-core: all interfaces and classes in 'api' and 'common' modules +* apex-malhar: all interfaces and classes in all modules except 'demos', 'samples', 'benchmark' + +Interfaces and classes that are part of the public API and are annotated with [interface stability](https://hadoop.apache.org/docs/stable/hadoop-project-dist/hadoop-common/InterfaceClassification.html) are treated according to the rules defined by the annotation. + +Policy + +Changes to the public API must follow semantic versioning. +Public APIs must be deprecated for at least one major release prior to their removal in a major release. +The japicmp plugin is used to enforce compatibility as part of the Travis pre-commit builds. + ####Semantic compatibility + +The behavior of APIs needs to remain consistent over versions, though changes for correctness may result in changes in behavior. Tests and javadocs specify the behavior. Over time, test suites should be expanded to verify compliance with the specification, effectively creating a formal specification for the subset of behaviors that can be easily tested. + +Policy + +The behavior of API may be changed to fix incorrect behavior, changes to be accompanied by tests coverage for the exact behavior. + ####REST API + +REST API compatibility corresponds to both the URLs and request/response content over the wire. REST APIs are specifically meant for stable use by clients across releases, even major releases. + +Policy + +The REST API is separately versioned. This is to allow for co-existence of old and new API should there be a need for backward incompatible changes in the future. + ####Command Line Interface (CLI) + +The CLI may be used either directly via the system shell or via shell scripts. Changing the path, removing or renaming command line options, the order of arguments, or the command return code and output break compatibility and may adversely affect users. + +Policy + +CLI commands are to be deprecated (warning when used) in a prior minor release before they are removed or incompatibly modified in a subsequent major release. + ####Configuration Files + +Configuration files are used for engine or application settings. Changes to keys and default values affect users. + +Policy + +Name, location, format, keys of configuration files should be deprecated in a prior minor release and can only be changed in major release. Best effort should be made to</p> | <a href="https://issues.apache.org/jira/browse/APEXCORE-319">https://issues.apache.org/jira/browse/APEXCORE-319</a> |

| 20299 | APEXCORE-318 | <p>Chris if we follow a similar model like hadoop of using a separate email list is it ok to ask infra for an email list like security@apex.apache.org (without using incubator) or should we wait till the last possible moment before becoming top level to request this. Secondly since the nature of the groups like these would be to not announce issues to the public until the vulnerabilities are fixed, is it right to assume that the membership to this group is selective and may not be every committer. Also how do groups like these track issues before the vulnerabilities are fixed, can JIRA still be used without making the information public for these till the fix.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://issues.apache.org/jira/browse/APEXCORE-318">https://issues.apache.org/jira/browse/APEXCORE-318</a> |

I would expect StramAppLauncher.runLocal to use LocalMode.runApp() so functionality is the same when application is launched in application test and using dtcli local mode.                                                            | <a href="https://issues.apache.org/jira/browse/APEXCORE-304">https://issues.apache.org/jira/browse/APEXCORE-304</a> |

| 20317 | APEXCORE-304 | Github user chinmaykolhatkar commented on a diff in the pull request: <a href="https://github.com/apache/incubator-apex-core/pull/311#discussion_r61535209">https://github.com/apache/incubator-apex-core/pull/311#discussion_r61535209</a> --- Diff:<br>engine/src/main/java/com/datatorrent/stram/plan/logical/LogicalPlan.java --- @@ -2386,7+2381,7 @@ public static void write(DAG dag, OutputStream os) throws<br>IOException<br>public static LogicalPlan read(InputStream is) throws IOException, ClassNotFoundException { - return (LogicalPlan)new<br>ObjectInputStream(is).readObject(); + return (LogicalPlan)new ClassLoaderObjectInputStream(Thread.currentThread().getContextClassLoader(), is).readObject(); ---<br>End diff -- This is required for Local Mode case. Lets say a jar path is set to LIBRARY_JARS and this jar contains a POJO that needs to be set to TUPLE_CLASS<br>attr. Now, one can do that in populateDAG method, that would cause a problem in LocalMode as follows: 1. populateDAG sets TUPLE_CLASS attr with new POJO class -<br>Works. 2. Local mode serializes the LogicalPlan - Works. 3. Local mode deserialized the LogicalPlan - Fails. 3rd step fails because The ObjectInputStream<br>deserializer uses System ClassLoader which does that have that POJO. ClassLoaderObjectInputStream is an overridden version of ObjectInputStream which allows to set<br>the custom classloader. By this time of callstack, Thread.currentThread().getClassLoader() will have a classloader which is super of all. As previously, there was<br>no functionality of LIBRARY_JARS, I guess this was not tested and so did not surface as an issue. For cluster mode, there is no difference. i.e. There is only 1<br>classloader i.e. System.Classloader and that has new jars as well. i.e. For cluster mode, Thread.currentThread().getClassLoader() = System classloader i.e.<br>ClassLoaderObjectInputStream will behave as if ObjectInputStream. | <a href="https://issues.apache.org/jira/browse/APEXCORE-304">https://issues.apache.org/jira/browse/APEXCORE-304</a> |
| 20318 | APEXCORE-294 | What is the advantage of end stream tuple over ShutdownException?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <a href="https://issues.apache.org/jira/browse/APEXCORE-294">https://issues.apache.org/jira/browse/APEXCORE-294</a> |

| 20319 | APEXCORE-294 | Is it that the shutdownException is controlled more by STRAM and the control tuple will flow naturally in the DAG? As I understand, when a ShutdownException is thrown by an operator, it propagates to its downstream operators via STRAM as shutdown requests for each container.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <a href="https://issues.apache.org/jira/browse/APEXCORE-294">https://issues.apache.org/jira/browse/APEXCORE-294</a> |
| 20320 | APEXCORE-294 | What will be the trigger for this? Could you please provide some details?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="https://issues.apache.org/jira/browse/APEXCORE-294">https://issues.apache.org/jira/browse/APEXCORE-294</a> |
| 20321 | APEXCORE-294 | would sending END_STREAM tuple from all input operators partition will work. Is there any other complication with this approach? If this approach is fine I would start working on it. The flow would be - Master receives shutdown command from cli/rest api - Master set shutdown on each container and send it as part of heartbeat response to all containers - On receiving shutdown command StreamingContainer would mark alive false for all InputNode causing them to terminate with sending END_STREAM tuple downstream. same could be achieve using operatorRequest for all input operator partition and this request will be handled by StreamingContainer to shutdown the input operator thread.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <a href="https://issues.apache.org/jira/browse/APEXCORE-294">https://issues.apache.org/jira/browse/APEXCORE-294</a> |
| 20322 | APEXCORE-293 | Documentation source code will be hosted in apex-core repository on ASF. Generated documentation can be hosted on apex.incubator.apache.org, but it involves more steps to process, generate, and deal with document deployments, when compared with solutions like readthedocs.org, readme.io, etc. I notice several other Apache projects host their docs outside ASF, including Apache Ignite ( <a href="https://apacheignite.readme.io/docs">https://apacheignite.readme.io/docs</a> ), Apache Libcloud ( <a href="https://libcloud.readthedocs.org/en/latest/">https://libcloud.readthedocs.org/en/latest/</a> ), etc. Does ASF mandate that documentation be hosted on apache.org? And if ASF infrastructure is required, is there a simple solution similar to readthedocs for markdown docs, which supports multiple release versions, etc?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <a href="https://issues.apache.org/jira/browse/APEXCORE-293">https://issues.apache.org/jira/browse/APEXCORE-293</a> |
| 20323 | APEXCORE-293 | Is the intention to completely remove any references to external documentation, or to add rel="nofollow" to external links?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <a href="https://issues.apache.org/jira/browse/APEXCORE-293">https://issues.apache.org/jira/browse/APEXCORE-293</a> |
| 20324 | APEXCORE-293 | [~sasha] We should review the need for each of these links. It is not clear, for example, why we would point to RTS docs for configuration. [~ptgoetz] In those cases where external links are appropriate, is it a matter of adding rel="nofollow"?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/APEXCORE-293">https://issues.apache.org/jira/browse/APEXCORE-293</a> |

Do we want them to be fixed over time? If not, should warning rule be disabled completely?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <a href="https://issues.apache.org/jira/browse/APEXCORE-268">https://issues.apache.org/jira/browse/APEXCORE-268</a> |
| 20343 | APEXCORE-268 | Github user vrozov commented on the pull request: <a href="https://github.com/apache/incubator-apex-core/pull/199#issuecomment-170188868">https://github.com/apache/incubator-apex-core/pull/199#issuecomment-170188868</a> @chandnisingh I don't think it is the question of importance. It is the question of convenience for developers. If compiler warnings don't clutter build log, checkstyle warnings also should not clutter. Will suppression of LineLength warnings be a workable solution? In this case you may add <sup><suppress checks="LineLength" files="" /></sup> to checkstyle-suppressions.xml                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://issues.apache.org/jira/browse/APEXCORE-268">https://issues.apache.org/jira/browse/APEXCORE-268</a> |
| 20344 | APEXCORE-268 | Github user chandnisingh commented on the pull request: <a href="https://github.com/apache/incubator-apex-core/pull/199#issuecomment-170189818">https://github.com/apache/incubator-apex-core/pull/199#issuecomment-170189818</a> There should be a separate discussion on that since now it is a debate. I don't think it is a problem to run just another command to see the exact violation. Don't the users already do that for license, etc?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <a href="https://issues.apache.org/jira/browse/APEXCORE-268">https://issues.apache.org/jira/browse/APEXCORE-268</a> |
| 20345 | APEXCORE-268 | Github user chandnisingh commented on the pull request: <a href="https://github.com/apache/incubator-apex-core/pull/199#issuecomment-170200390">https://github.com/apache/incubator-apex-core/pull/199#issuecomment-170200390</a> I don't agree with it. A lot of folks in the community wanted fixed line length which is why I added it as a warning. That pull request was merged without any objections. So why suppress the warnings on an unrelated change. With this change it's not that I am increasing the steps. They are same as what they were. This is a separate topic and the whole community should participate in making that decision                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/APEXCORE-268">https://issues.apache.org/jira/browse/APEXCORE-268</a> |
| 20346 | APEXCORE-259 | Did you mean Buffer Server resides in the same node?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <a href="https://issues.apache.org/jira/browse/APEXCORE-259">https://issues.apache.org/jira/browse/APEXCORE-259</a> |
| 20347 | APEXCORE-254 | why is this needed?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://issues.apache.org/jira/browse/APEXCORE-254">https://issues.apache.org/jira/browse/APEXCORE-254</a> |
| 20348 | APEXCORE-252 | Would it be better to keep a layer of abstraction with CircularBuffer proxying SpscArrayQueue. If there is a different queue implementation in future all code using it doesn't have to change.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <a href="https://issues.apache.org/jira/browse/APEXCORE-252">https://issues.apache.org/jira/browse/APEXCORE-252</a> |
| 20349 | APEXCORE-247 | Hi Sandesh, do you have a status update on this item?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/APEXCORE-247">https://issues.apache.org/jira/browse/APEXCORE-247</a> |
| 20350 | APEXCORE-246 | Was there a discussion about this new feature?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <a href="https://issues.apache.org/jira/browse/APEXCORE-246">https://issues.apache.org/jira/browse/APEXCORE-246</a> |
| 20351 | APEXCORE-225 | Why is this needed ?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <a href="https://issues.apache.org/jira/browse/APEXCORE-225">https://issues.apache.org/jira/browse/APEXCORE-225</a> |
| 20352 | APEXCORE-225 | What was the reason for not providing it in the input port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="https://issues.apache.org/jira/browse/APEXCORE-225">https://issues.apache.org/jira/browse/APEXCORE-225</a> |
| 20353 | APEXCORE-222 | Why is this improvement needed?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <a href="https://issues.apache.org/jira/browse/APEXCORE-222">https://issues.apache.org/jira/browse/APEXCORE-222</a> |

| 20363 | APEXCORE-215 | @tweise and @vrozov : Could you please comment on Chinmay's comment on compiling Malhar with new Apex to check backward compatibility?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <a href="https://issues.apache.org/jira/browse/APEXCORE-215">https://issues.apache.org/jira/browse/APEXCORE-215</a> |
| 20364 | APEXCORE-215 | <p>Github user twice commented on a diff in the pull request: <a href="https://github.com/apache/incubator-apex-site/pull/11#discussion_r53426395">https://github.com/apache/incubator-apex-site/pull/11#discussion_r53426395</a> --- Diff:</p> <pre>src/md/verification.md --- @ -0,0 +1,88 @@ +# How to verify Apache Apex (incubating) release candidate builds +### Prerequisites +1. *gpg* program should be installed on your system. +2. Download the KEYS file and import it. This is one time activity. +'''bash +wget https://dist.apache.org/repos/dist/release/incubator/apex/KEYS +gpg --import KEYS +''' +3. You can also created your own key which is required if you would like to sign the build. This step is optional. +'''bash +gpg --gen-key +''' +Please provide 4096 as keysize while generating the key. +### File integrity check +Download all files present in staging directory of the RC build. Staging directory link is shared in VOTE thread of the release candidate. +'''bash +wget -r -np -nd &lt;staging-area-link&gt; +''' +Note the link should end with "/". +Define the apex release candidate variable. We will set it up *apex-3.3.0-incubating* as an example. +'''bash +APEX_RELEASE_CANDIDATE=apex-3.3.0-incubating +''' +Verify integrity of tar.gz file: +'''bash +gpg --verify \$APEX_RELEASE_CANDIDATE-source-release.tar.gz.asc +md5sum --check \$APEX_RELEASE_CANDIDATE-source-release.tar.gz.md5 +sha512sum --check \$APEX_RELEASE_CANDIDATE-source-release.tar.gz.sha +''' +Verify integrity of .zip file: +'''bash +gpg --verify \$APEX_RELEASE_CANDIDATE-source-release.zip.asc +md5sum --check \$APEX_RELEASE_CANDIDATE-source-release.zip.md5 +sha512sum --check \$APEX_RELEASE_CANDIDATE-source-release.zip.sha +''' +### Source code verification +You can extract source either using .tar.gz file or .zip file. +#### Using .tar.gz source +Extract source using .tar.gz: +'''bash +tar -zxvf \$APEX_RELEASE_CANDIDATE-source-release.tar.gz +''' +#### Using .zip source +'''bash +unzip \$APEX_RELEASE_CANDIDATE-source-release.zip +''' +Any of the two commands above will create a directory named after *apex release candidate*. +#### Check for compilation, license headers, etc. +The last step is optional and needs prerequisite 3 given above. +'''bash +cd \$APEX_RELEASE_CANDIDATE +mvn clean apache-rat:check +''' +Dlicense.skip=false -Pall-modules verify -Papache-release package +''' +In case of Apex release, you can skip -Papache-release option as there are no modules defined in Apex as of now. +### Launch demos +Launch few demos to make sure everything is working fine using dtcli utility. The dtcli script is present at &lt;apex-core-folder&gt;/engine/src/main/scripts/dtcli . If apex-core is being verified, then simply use engine/src/main/scripts/dtcli to launch the script. Otherwise, prefix it with apex-core folder path. +'''bash +engine/src/main/scripts/dtcli +''' +You will get dtcli prompt, where demos can be launched. +'''bash +dt launch &lt;demo-apk-file&gt; +''' +--- End diff --- Do you mean launch existing version of demo with new Apex version? If so, then yes. In general, these are recommendations what folks can do to verify a release and not everyone will run through all of them.</pre> | <a href="https://issues.apache.org/jira/browse/APEXCORE-215">https://issues.apache.org/jira/browse/APEXCORE-215</a> |
| 20365 | APEXCORE-202 | Shouldn't this be in Malhar?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/APEXCORE-202">https://issues.apache.org/jira/browse/APEXCORE-202</a> |
| 20366 | APEXCORE-199 | How about if it is compatible with the CLI version but incompatible with the RTS installation ?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/APEXCORE-199">https://issues.apache.org/jira/browse/APEXCORE-199</a> |
| 20367 | APEXCORE-199 | CLI does not know anything about RTS. But can you give an example of such situation? What kind of app would be compatible with the platform but not with the distribution that includes it?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <a href="https://issues.apache.org/jira/browse/APEXCORE-199">https://issues.apache.org/jira/browse/APEXCORE-199</a> |
| 20368 | APEXCORE-199 | Why was this reopened ?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <a href="https://issues.apache.org/jira/browse/APEXCORE-199">https://issues.apache.org/jira/browse/APEXCORE-199</a> |
| 20369 | APEXCORE-168 | Is \${package} replaced during project creation? @davidyan The log4j properties discussed here are used for testing in the IDE only. They are not part of the .apa and therefore don't affect execution on the cluster.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <a href="https://issues.apache.org/jira/browse/APEXCORE-168">https://issues.apache.org/jira/browse/APEXCORE-168</a> |
| 20370 | APEXCORE-150 | Can you add an example of where the MxN partitioning with multiple unifier partitions in parallel with the downstream operator partitions would not be sufficient to illustrate the point better.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="https://issues.apache.org/jira/browse/APEXCORE-150">https://issues.apache.org/jira/browse/APEXCORE-150</a> |
| 20371 | APEXCORE-150 | Why are cascading unifiers not sufficient?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://issues.apache.org/jira/browse/APEXCORE-150">https://issues.apache.org/jira/browse/APEXCORE-150</a> |
| 20372 | APEXCORE-143 | Could you please add a test case for this.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://issues.apache.org/jira/browse/APEXCORE-143">https://issues.apache.org/jira/browse/APEXCORE-143</a> |
| 20373 | APEXCORE-143 | What exactly are you trying to test? There is no guarantee that teardown will be executed on the cluster either, when the container process terminates due to a failure or because it was killed by the node manager.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <a href="https://issues.apache.org/jira/browse/APEXCORE-143">https://issues.apache.org/jira/browse/APEXCORE-143</a> |
| 20374 | APEXCORE-143 | If an application is shutdown gracefully, teardown of all the operators is invoked. In case of local cluster, which is used to write test cases, Priyanka observed that teardown is not invoked on shutdown call on the cluster. We are shutting down the cluster and hence the application running within the local cluster is getting killed? No graceful shutdown here. Is there a way to shutdown the application in local mode ?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <a href="https://issues.apache.org/jira/browse/APEXCORE-143">https://issues.apache.org/jira/browse/APEXCORE-143</a> |

| 20375 | APEXCORE-143 | teardown is not the place to effect changes to data. It is outside of the data flow and as we discussed, you cannot rely on it being called. Instead of looking for a workaround for the unit test, I would suggest you fix the real problem. Why can you not do this by implementing CheckpointListener or as part of rolling the output file, for example?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <a href="https://issues.apache.org/jira/browse/APEXCORE-143">https://issues.apache.org/jira/browse/APEXCORE-143</a> |
| 20376 | APEXCORE-139 | Can I take this one?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/APEXCORE-139">https://issues.apache.org/jira/browse/APEXCORE-139</a> |

This has been completed and backported to the various branches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/APEXCORE-131">https://issues.apache.org/jira/browse/APEXCORE-131</a> |
| 20378 | APEXCORE-128 | why is this needed? Please open a discussion on dev@.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <a href="https://issues.apache.org/jira/browse/APEXCORE-128">https://issues.apache.org/jira/browse/APEXCORE-128</a> |
| 20379 | APEXCORE-119 | Sounds like some sort of IMDG powered by partitions of an operator. Can you elaborate on performance and scalability characteristics? Can this be done without changes to the engine? Can this be done within the single thread per operator paradigm?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <a href="https://issues.apache.org/jira/browse/APEXCORE-119">https://issues.apache.org/jira/browse/APEXCORE-119</a> |
| 20380 | APEXCORE-119 | Can delay operator be used for synchronizing windows across partitions?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/APEXCORE-119">https://issues.apache.org/jira/browse/APEXCORE-119</a> |

| 20384 | APEXCORE-103 | Here are some comments I have about the design. These are repeated from the pull request. 1. DAG scoping currently is global for modules, each module's populateDAG sees the entire DAG. 2. The module has a populateDAG method with exact same syntax as in StreamingApplication. Is StreamingApplication also a module, should it extend that interface. 3. Setting properties for modules is too verbose. Module developer needs to repeat every property they want exposed with a setter and getter in JAVA. I don't disagree that module developer should be able to choose which properties from which operators need to be exposed but the current way seems to duplicate code. Here is a suggestion. a. Allow modules to specify which operators and properties can be accessible from outside. One way is in the "populateDAG" method of the module when adding the operator have the ability to specify if this operator can be accessible from outside and which or all properties can be accessible. b. Provide methods in ModuleMeta or elsewhere to set property values by specifying the operator name (friendly name) inside the module and property name. If this is allowed by a. above it is successful else it should fail. c. Allow a syntax in property files to specify the property in b. Example syntax dt.module.<modulename>.operator.<operatorname>.prop.<propname> 4. For attributes same mechanism as in 3 should apply for the operators that are exposed by the module. For property file, example syntax dt.module.<modulename>.operator.<operatorname>.attr.<attrname> 5. Module developers in addition to 3. and 4. above may choose to support module level properties and attributes. These should not be the default when 3. and 4. are possible but complementary in addition to them. In this case for properties they can implement setters and getters in the module. For attributes the user should still be able to set the attributes using the dag setAttribute method. You could introduce a method in the module to process attributes that can get called by the engine once everything is set. 6. For 5. above setting global properties and attributes for module is akin to ideas that have been proposed for the application as well. A consistent way must be possible for applications as well even if it is not implemented now. 7. For 5. or 6. above there should be a property file way of specifying the global module properties and attributes. Example syntax dt.module.<modulename>.prop.<propname>, dt.module.<modulename>.attr.<attrname>. Notice the difference with 3. c. and 4 above that there is no operator keyword here. 8. Partitioning needs to be consistent with what the user will expect when they see module as an entity. I will send an image of possible examples of how the user will expect the physical plan to look in certain cases. | <a href="https://issues.apache.org/jira/browse/APEXCORE-103">https://issues.apache.org/jira/browse/APEXCORE-103</a> |
| 20385 | APEXCORE-90  | I've SSH'ed into people.apache.org and see where all the project websites are located, however the user:group ownership is all svnwc. I'm assuming this is the user that performs actions on behalf of the CMS, however since I can't get the "bookmarklet" thing to work, I'm not sure how to proceed. The relevant part of the guide actually says *THIS IS VERY OUTDATED AND NEEDS FIXING* and so I am not sure what to trust in that regard. I suppose I could simply create the necessary folder (/www/apex.apache.org) and add the files I want to that, then simply chown it to svnwc:svnwc, but something tells me I'm going down the wrong path with this tactic. [cnauroth] or [amolkekre], can you provide any guidance on this? I'll also send this out via dev@ update: just tried to create a folder in /www and it looks like I don't have permission to do that anyway so there you go...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="https://issues.apache.org/jira/browse/APEXCORE-90">https://issues.apache.org/jira/browse/APEXCORE-90</a>   |
| 20386 | APEXCORE-78  | Why should this be changed?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <a href="https://issues.apache.org/jira/browse/APEXCORE-78">https://issues.apache.org/jira/browse/APEXCORE-78</a>   |

| #     | Requirement | Questions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | URL                                                                                                               |

| 20387 | APEXCORE-73 | Hi Atri, That disk spooling should only happen when the memory used is getting close to configured limit. Are you seeing a different behavior. Thanks                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/APEXCORE-73">https://issues.apache.org/jira/browse/APEXCORE-73</a> |
| 20388 | APEXCORE-71 | Given that this is really a workaround, can you please explain why we need to do this in first place? Should mention how it should work ideally (i.e. ability to pull the actual config values from the services).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/APEXCORE-71">https://issues.apache.org/jira/browse/APEXCORE-71</a> |
| 20389 | APEXCORE-69 | did you send an example on what the problem is? I cannot locate it... can you post it here? Thanks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <a href="https://issues.apache.org/jira/browse/APEXCORE-69">https://issues.apache.org/jira/browse/APEXCORE-69</a> |
| 20390 | APEXCORE-69 | my understanding is that Slowing down of the upstream should happen automatically as tcp is used for communication and tcp does the congestion control. So that is not working ?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://issues.apache.org/jira/browse/APEXCORE-69">https://issues.apache.org/jira/browse/APEXCORE-69</a> |

| 20416 | APEXCORE-60 | <p>Github user davidyan74 commented on a diff in the pull request: <a href="https://github.com/apache/incubator-apex-core/pull/185#discussion_r49259156">https://github.com/apache/incubator-apex-core/pull/185#discussion_r49259156</a> --- Diff:</p> <pre> engine/src/main/java/com/datatorrent/stram/StreamingContainerManager.java --- @@ -1917,25 +1930,30 @@ public void updateRecoveryCheckpoints(PTOperator operator, UpdateCheckpointsCont long currentWindowId = WindowGenerator.getWindowId(ctx.currentTms, this.vars.windowStartMillis, this.getLogicalPlan().getValue(LogicalPlan.STREAMING_WINDOW_SIZE_MILLIS)); maxCheckpoint = currentWindowId; } + ctx.visited.add(operator); // DFS downstream operators - for (PTOperator.PTOutput out : operator.getOutputs()) { - for (PTOperator.PTInput sink : out.sinks) { - PTOperator sinkOperator = sink.target; - if (!ctx.visited.contains(sinkOperator)) { - // downstream traversal - updateRecoveryCheckpoints(sinkOperator, ctx); - } - // recovery window id cannot move backwards - // when dynamically adding new operators - if (sinkOperator.getRecoveryCheckpoint().windowId &gt;= operator.getRecoveryCheckpoint().windowId) { - maxCheckpoint = Math.min(maxCheckpoint, sinkOperator.getRecoveryCheckpoint().windowId); - } + if (operator.getOperatorMeta().getOperator() instanceof Operator.DelayOperator) { + addVisited(operator, ctx); + } else { --- End diff -- @tweise I think I'm not doing this correctly and hence the out-of-sequence tuple in the unit test. My debugging indicates that the recovery checkpoints are not in sync for the operators that try to recover. Can you please review this and see what I'm doing wrong? </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <a href="https://issues.apache.org/jira/browse/APEXCORE-60">https://issues.apache.org/jira/browse/APEXCORE-60</a> |
| 20417 | APEXCORE-59 | why is this minor priority?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <a href="https://issues.apache.org/jira/browse/APEXCORE-59">https://issues.apache.org/jira/browse/APEXCORE-59</a> |
| 20418 | APEXCORE-55 | <p>h1. Module support. h2. Introduction A module framework provides a way to use a group of operator as a single entity in a application. This will allow group of operator to implement a higher level functionality, which can be embedded in another streaming application. For example a module M1 is defined as following DAG. where M2 is also another module. {code} O3   O1-&gt;O2   M2 {code} and Module M2 as {code} O4-&gt;O5 {code} And application is defined as {code} A-&gt;M1-&gt;B {code} Then during logical plan expansion module M1 will be replaced by its operator and resulting DAG will be expanded again till no modules remain in the DAG. For example given application will expand as below. {code} O3   A-&gt;O1-&gt;O2-&gt;B   O4-&gt;O5 {code} h2. Goals Logically a Module will contain. * A List of input ports. * A list of output ports. * Configuration properties. ** Name of the property. ** Type of the property. * Attributes? (not decided which attribute make sense for a module). For most of the modules all internal component and their connection is already know. The other type of module will be populate the internal components based on properties set on the module. We will be targeting first type of modules with static sub-dag. h3. Properties A module will have its own properties. Module will hide properties of internal components, means user will only be able to set properties defined on module, and need not know the internal structure of module. Module will populate internal components properties as required based on its properties. Does it needs to have support for setting module property at runtime? This will require us to maintain runtime object for module. i.e module definition can not go away after logical plan expansion. Also any complex execution done my module inside setter needs to be tracked and sent to container running operators in the module. h3. Attributes partitions?? h3. Module Definition Languages User should be able to write modules in java. And other JVM compatible languages. We plan to provide compact api for defining module in javascript which are loaded in java using Javascript/Java bridge (JSR 292). A similar interface will be provided for python using Jython. The syntax will look like mostly like configuration description. h3. Application Builder Compatibility Another goal is that user should be able to define modules using application builder, where user will build a DAG for module and save it as a module. To support this functionality we will have support for defining module in json. As json does not support defining complex expressions, this will be applicable for simpler modules. h3. Port Type Checking We need to have type checking for the module ports. If Module is defined in java then we can have type check enforced by the compiler. In other cases we need to have a way to enforce type check during port connection time or logical dag validation time. h2. Implementation h3. API {code} public interface Module extends Component&lt;ModuleContext&gt; { /** * get list of input port exported by the module. */ public Map&lt;String, Operator.InputPort&gt; getInputPorts(); /** * get list of output ports exported by the module. */ public Map&lt;String, Operator.OutputPort&gt; getOutputPorts(); /** * This function will be called by engine to add operators/modules in the application DAG and connect them as per modules requirement. */ public void flattenDAG(DAG dag, Configuration conf); /** * return property of the module */ public Object getProperty(String key); /** * set property on the module */ public Object setProperty(String key, Object value); /** * return list of properties supported by the module. */ public Collection&lt;String&gt; getProperties(); } {code}</p> | <a href="https://issues.apache.org/jira/browse/APEXCORE-55">https://issues.apache.org/jira/browse/APEXCORE-55</a> |
| 20419 | APEXCORE-55 | What is the rationale to make ports on modules dynamic? Do you have an example use case? What is the runtime representation of a module? What drives the dynamic structure of a module? Can setting a property change ports and operators in it? If so, what happens when such properties are set at runtime? Full partitioning support for modules will require significant changes to the current physical plan translation. Has the impact been assessed? Or are you planning to have corresponding restrictions in the initial module implementation? How does this work converge with APEXCORE-3? This JIRA needs to be broken down into subtasks and the relationship to other parts of the engine more clearly called out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <a href="https://issues.apache.org/jira/browse/APEXCORE-55">https://issues.apache.org/jira/browse/APEXCORE-55</a> |
| 20420 | APEXCORE-34 | Did you confirm that after running the command all version strings have been replaced?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="https://issues.apache.org/jira/browse/APEXCORE-34">https://issues.apache.org/jira/browse/APEXCORE-34</a> |

Will reopen when changes in core gets in.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://issues.apache.org/jira/browse/APEXCORE-34">https://issues.apache.org/jira/browse/APEXCORE-34</a> |
| 20422 | APEXCORE-31 | Can we also evaluate akka, few projects are using it. <a href="http://www.slideshare.net/fhueske/flink-akka20150128">http://www.slideshare.net/fhueske/flink-akka20150128</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <a href="https://issues.apache.org/jira/browse/APEXCORE-31">https://issues.apache.org/jira/browse/APEXCORE-31</a> |
| 20423 | APEXCORE-22 | Does this fix handle the below scenario? I have two different DAGs to run, I shall use A in one DAG and B in another. A extends B, I have declared output ports in A and B as well. When I use A in my DAG, it shows output port overridden error in 3.1.0 release. This requirement can be fulfilled with different implementation for the use case but I am just curious.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <a href="https://issues.apache.org/jira/browse/APEXCORE-22">https://issues.apache.org/jira/browse/APEXCORE-22</a> |
| 20424 | APEXCORE-19 | can you list the a couple of use cases which need this?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <a href="https://issues.apache.org/jira/browse/APEXCORE-19">https://issues.apache.org/jira/browse/APEXCORE-19</a> |
| 20425 | APEXCORE-17 | [~davidyan] in ClusterAppStats you have used @AppDataPushAgent.Metric on methods. Is that really needed? Do you extract the names of these metrics for the getterMethod. If yes, where is that being done?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <a href="https://issues.apache.org/jira/browse/APEXCORE-17">https://issues.apache.org/jira/browse/APEXCORE-17</a> |

| 20426 | APEXCORE-17 | 1. If this change is not included, then we know for sure that it needs to be changed. If there is a constant added to spell out that it can support phase, then may be we will need to change it may be we will not need to change it. which one is better? 2. I realize that there is not a lot of time left hence I recommended putting the stubs in and having the implementation later. You can defer even specifying various phases. The one which you have implemented, have it specified (or even defaulted to). -- Chetan                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <a href="https://issues.apache.org/jira/browse/APEXCORE-17">https://issues.apache.org/jira/browse/APEXCORE-17</a> |
| 20427 | APEXCORE-17 | I have created another ticket for phases. Can I resolve this?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="https://issues.apache.org/jira/browse/APEXCORE-17">https://issues.apache.org/jira/browse/APEXCORE-17</a> |
| 20428 | APEXCORE-16 | What is the agreement on white spaces for type cast? Should APEX use white space after the cast? Please see [http://www.oracle.com/technetwork/java/javase/documentation/codeconventions-141388.html]: Casts should be followed by a blank space. Examples: {noformat} myMethod((byte) aNum, (Object) x); myMethod((int) (cp + 5), ((int) (i + 3)) + 1); {noformat}                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <a href="https://issues.apache.org/jira/browse/APEXCORE-16">https://issues.apache.org/jira/browse/APEXCORE-16</a> |
| 20429 | APEXCORE-13 | Why cause unnecessarily additional HDFS operations in the master when the same is available for free in the container? The container should propagate the checkpoint only after it has been written (approach 1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <a href="https://issues.apache.org/jira/browse/APEXCORE-13">https://issues.apache.org/jira/browse/APEXCORE-13</a> |
| 20430 | APEXCORE-10 | this is a very important requirement, when can we have it                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <a href="https://issues.apache.org/jira/browse/APEXCORE-10">https://issues.apache.org/jira/browse/APEXCORE-10</a> |
| 20431 | APEXCORE-10 | There are two pieces to this: 1) how you express the constraint and 2) how you implement it using the RM API. 1) I understand you are proposing to define the operators that should not be on the same host as an attribute. How will this translate to the physical plan? How do we express that 2 partitions of the same operator are not on the same host? 2) Yes, we may run out of resources and launch time will increase if we sequence the sets. All containers that don't have the affinity constraint will still be allocated first? Why does the rest need to be sequential?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/APEXCORE-10">https://issues.apache.org/jira/browse/APEXCORE-10</a> |
| 20432 | APEXCORE-10 | As an additional note, is there any way that you could see specifying anti-affinity between partitions of an operator? At the moment we can specify affinity/anti-affinity between logical operators but it would be very useful to specify anti-affinity between partitions of a single logical operator (for the sake of durability, for example).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <a href="https://issues.apache.org/jira/browse/APEXCORE-10">https://issues.apache.org/jira/browse/APEXCORE-10</a> |
| 20433 | APEXCORE-10 | A couple of questions - Would anti-affinity for partitions take precedence over the anti-affinity of operators? Can this be configured? Wouldn't there be a cascading effect of partitioning on the anti-affinity of operators? In case of clashes between anti-affinity and locality, what takes precedence? (For example, would the partitions be created across racks and different operators remain in the nodes on the same rack, or would all the partitions be within the same rack and the locality for operators will not be honored?) What would happen if a node crashes and YARN allocates a node on which another operator/partition is already active. YARN would not have any knowledge about the anti-affinity. So what would be our approach in this case? Ideally, if we get resources from YARN on a certain node, we should be able to run the instance/operator on the same node. However, is there a guarantee that YARN will allocate the exact resources we have asked for? Further even if it does, would we honour the "strict" policy and prevent the instance/operator from coming up or we bypass the same.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <a href="https://issues.apache.org/jira/browse/APEXCORE-10">https://issues.apache.org/jira/browse/APEXCORE-10</a> |
| 20434 | APEXCORE-10 | In case of anti-affinity and host-locality set among partitions of operator, yes, we need to set precedence order. Another option is: should we check for such contradicting settings this in dag.validate phase itself?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <a href="https://issues.apache.org/jira/browse/APEXCORE-10">https://issues.apache.org/jira/browse/APEXCORE-10</a> |

There are two types of rules that can be specified: Affinity and + * Anti-affinity. Each rule contains list of operators or pair of 2 operators or + * a regex that should match at least 2 operators. Based on the type of rule, + * affinity or anti-affinity, the operators will be deployed together or away + * from each other. The locality indicates the level at which the rule should be + * applied. E.g. CONTAINER_LOCAL affinity would indicate operators Should be + * allocated within same container NODE_LOCAL anti-affinity indicates that the + * operators should not be allocated on the same node. The rule can be either + * strict or relaxed. + * + */ +public class AffinityRule implements Serializable +{ + @Override + public String toString() + { + return "AffinityRule {operatorsList=" + operatorsList + ", operatorRegex=" + operatorRegex + ", locality=" + locality + ", type=" + type + ", relaxLocality=" + relaxLocality + "}"; + } + + private static final long serialVersionUID = 107131504929875386L; + + /** + * Type of affinity rule setting affects how operators are scheduled for + * deployment by the platform. + * + */ + public static enum Type + { + /** + * AFFINITY indicates that operators in the rule should be deployed within + * locality specified in the rule + * + */ + AFFINITY, + /** + * ANTI_AFFINITY indicates that operators in the rule should NOT be deployed + * within same locality as specified in rule + * + */ + ANTI_AFFINITY + } + + private List&lt;String&gt; operatorsList; + private String operatorRegex; + private Local locality; + private Type type; + private boolean relaxLocality; + + public AffinityRule() + { + } + + public AffinityRule(Type type, Local locality, boolean relaxLocality) + { + this.type = type; + this.locality = locality; + this.setRelaxLocality(relaxLocality); + } + + public AffinityRule(Type type, Local locality, boolean relaxLocality, String... operators) --- End diff -- Does it require at least 2 operators? If they are not, please create a follow up JIRA so we can address it later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/APEXCORE-10">https://issues.apache.org/jira/browse/APEXCORE-10</a> |
| 20446 | APEXCORE-9  | this is important when can we get this                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <a href="https://issues.apache.org/jira/browse/APEXCORE-9">https://issues.apache.org/jira/browse/APEXCORE-9</a>   |
| 20447 | APEXCORE-4  | We forgot to discuss this on Friday. I think Thomas should probably be in this discussion and he is coming back next weekend. Do you want to take this up after Thomas comes back?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="https://issues.apache.org/jira/browse/APEXCORE-4">https://issues.apache.org/jira/browse/APEXCORE-4</a>   |
| 20448 | APEXCORE-3  | Which version of DTRTS this feature will be available? We may need a patch for 2.0.1/                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <a href="https://issues.apache.org/jira/browse/APEXCORE-3">https://issues.apache.org/jira/browse/APEXCORE-3</a>   |
| 20449 | APEXCORE-3  | In a DAG say A -> B -> C Can a single physical operator say B, be spawned as B1 -> B2 -> B3 and append itself to the DAG at run time as part of this feature? Here B1, B2, B3 are instances of B. The values of B1, B2, B3 and so on are populated based on the output of Operator A.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <a href="https://issues.apache.org/jira/browse/APEXCORE-3">https://issues.apache.org/jira/browse/APEXCORE-3</a>   |
| 20450 | APEXCORE-3  | Can you explain a bit more as to how this will benefit APEXCORE-3? From what I understand, Module will be basically a replacable operator in DAG. It might be statically generated or runtime expanded. Is there any benefit that you see apart from code clarity (which might be a good enough reason)?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <a href="https://issues.apache.org/jira/browse/APEXCORE-3">https://issues.apache.org/jira/browse/APEXCORE-3</a>   |

| 20454 | APEXCORE-3      | <p>Github user tushargosavi commented on the pull request: <a href="https://github.com/apache/incubator-apex-core/pull/189#issuecomment-166447656">https://github.com/apache/incubator-apex-core/pull/189#issuecomment-166447656</a> I have made changes in my <a href="https://github.com/tushargosavi/incubator-apex-core/tree/pull189">https://github.com/tushargosavi/incubator-apex-core/tree/pull189</a> branch. I will have to do force push in your branch because checkstyle changes are worked into original commits. Is it fine?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <a href="https://issues.apache.org/jira/browse/APEXCORE-3">https://issues.apache.org/jira/browse/APEXCORE-3</a>           |
| 20455 | APEXMALHAR-2507 | <p>Hi Bhupesh, It looks like we already have an example doing pojo inner join using windowed merge operator ([<a href="https://github.com/apache/apex-malhar/blob/master/libraries/src/test/java/org/apache/apex/malhar/lib/window/impl/JoinInnerJoinTestApplication.java">https://github.com/apache/apex-malhar/blob/master/libraries/src/test/java/org/apache/apex/malhar/lib/window/impl/JoinInnerJoinTestApplication.java</a>]). Should we move this app to the example folder? -Shunxin</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2507">https://issues.apache.org/jira/browse/APEXMALHAR-2507</a> |
| 20456 | APEXMALHAR-2507 | <p>Hi all, Hitesh, could you elaborate on what you meant by "lost its way"? I will take a closer look at the app. Thomas, I agree [APEXMALHAR-2300] should be closed. I think the current example in innjoin folder will be removed in [APEXMALHAR-2488]</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2507">https://issues.apache.org/jira/browse/APEXMALHAR-2507</a> |
| 20457 | APEXMALHAR-2489 | <p>[~vrozov] what do you mean by _with modification_? I implemented the algorithm as described and it worked as expected, and also it removed the overflow issue.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2489">https://issues.apache.org/jira/browse/APEXMALHAR-2489</a> |

| 20458 | APEXMALHAR-2459 | IMO there is no need to touch 0.8 connectors, the decision to leave them as they are was made already and the can remain (and expire) in the contrib module. I wonder if we really need such elaborate structure for 0.9 and 0.10 or just have separate modules. How much of difference/overlap do you estimate to be there?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2459">https://issues.apache.org/jira/browse/APEXMALHAR-2459</a> |
| 20459 | APEXMALHAR-2458 | [~thw] are you suggesting the code of the application use the 0.9 operators or leave the application code and the change the dependency to 0.9. Is Kafka 0.8 not much in use? If not the example with 0.8 code may be useful to folks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2458">https://issues.apache.org/jira/browse/APEXMALHAR-2458</a> |
| 20460 | APEXMALHAR-2438 | I've been working with the above stores for a while now, could this be assigned to me ?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2438">https://issues.apache.org/jira/browse/APEXMALHAR-2438</a> |
| 20461 | APEXMALHAR-2386 | Could I work on this?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2386">https://issues.apache.org/jira/browse/APEXMALHAR-2386</a> |
| 20462 | APEXMALHAR-2376 | Hi, I am unable to assign this card to myself. Can someone please add my name to the contributor list?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2376">https://issues.apache.org/jira/browse/APEXMALHAR-2376</a> |
| 20463 | APEXMALHAR-2376 | [~thw] : Could you please make Akshay contributor and assign this JIRA to him.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2376">https://issues.apache.org/jira/browse/APEXMALHAR-2376</a> |
| 20464 | APEXMALHAR-2366 | As the number of elements increases, the probability of false positives increases; are we planning to recreate the filter with a larger bit vector or is this automatically done by the Hadoop implementation ?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2366">https://issues.apache.org/jira/browse/APEXMALHAR-2366</a> |
| 20465 | APEXMALHAR-2366 | Hi [~brightchen] Sorry for commenting so late. A bloom filter implementation is already implemented by [~chaitu] in the Megh library. You can see it here: <a href="https://github.com/DataTorrent/Megh/blob/master/library/src/main/java/com/datorrent/lib/bucket/bloomFilter/BloomFilter.java">https://github.com/DataTorrent/Megh/blob/master/library/src/main/java/com/datorrent/lib/bucket/bloomFilter/BloomFilter.java</a> Can you please see if this implementation can be reused? I am asking this because the one in Megh is well tested as part of an earlier Deduper implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2366">https://issues.apache.org/jira/browse/APEXMALHAR-2366</a> |
| 20466 | APEXMALHAR-2365 | Hi, I am unable to assign this card to myself. Can someone please add my name to the contributor list?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2365">https://issues.apache.org/jira/browse/APEXMALHAR-2365</a> |
| 20467 | APEXMALHAR-2365 | Can someone from PMC list assign this JIRA to Shraddha - jogshraddha . [~thw]: Could you please assign this and make Shraddha contributor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2365">https://issues.apache.org/jira/browse/APEXMALHAR-2365</a> |
| 20468 | APEXMALHAR-2365 | Couple of thoughts: 1. Some use cases why this is needed would be helpful. 2. Is the plan to convert the byte array to a String as a first step ? If so, the encoding for that conversion should be a parameter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2365">https://issues.apache.org/jira/browse/APEXMALHAR-2365</a> |
| 20469 | APEXMALHAR-2352 | - The insert to the map with item of ImmutablePair cost 2 to 3 times than item of com.datorrent.common.util.Pair - Kyro serializer serialize cost 6 to 8 times than customized serializer. The tuple which to serialize is generated with code "new ImmutablePair(new Window.TimeWindow<>(now + random.nextInt(100)), random.nextInt(100)), "" + random.nextInt(1000));"                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2352">https://issues.apache.org/jira/browse/APEXMALHAR-2352</a> |
| 20470 | APEXMALHAR-2339 | when use default AccumulationMode DISCARDING, it will have big impact for performance due to AbstractWindowedOperator.clearWindowData(Window)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2339">https://issues.apache.org/jira/browse/APEXMALHAR-2339</a> |
| 20471 | APEXMALHAR-2322 | Shouldn't we fix the issues instead? I would prefer the CI fails when code with invalid javadoc syntax is submitted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2322">https://issues.apache.org/jira/browse/APEXMALHAR-2322</a> |
| 20472 | APEXMALHAR-2321 | I changed to use keyStream and valueStream to manage the memory. But as we can't enforce the caller to use keyStream and valueStream to manage the memory, So it is also need to cleanup the maps. [~csingh] How do you think? and I saw you also clear the fileCache and close readers in freeMemory(). Is it better to move to another function or rename this method into something like releaseResource?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2321">https://issues.apache.org/jira/browse/APEXMALHAR-2321</a> |
| 20473 | APEXMALHAR-2283 | The exactly-once output logic is suspect. Why is it using the same key for all messages (appld+operatorid), why does it track extra window state in the operator and why does it rely on the hashcode of the object. In cases where the application can provide a unique message id, it should also be possible to use it for the key. It should be possible with the state stored in Kafka alone to do the dedup. The operator is also not easy to extend, we tried to implement output to topic depending on the tuple and found ourselves stuck with some private methods and unfriendly hooks. There is a need for redesign and good example.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2283">https://issues.apache.org/jira/browse/APEXMALHAR-2283</a> |
| 20474 | APEXMALHAR-2283 | The hashCode() assumption isn't documented. It is also not sufficient, there should be control in the operator itself how the hash code is computed. I think we should revisit the options for tracking the state. Is there an example someone can start from for this operator? Documentation?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2283">https://issues.apache.org/jira/browse/APEXMALHAR-2283</a> |
| 20475 | APEXMALHAR-2283 | There are couple of solutions to "exactly-once". To me they are all different and they all have different assumptions. First of all, if we assume there is unique message id, we can definitely use that for dedup, but that is not always the case, then we need appid and operatorid to do dedup. Then this information can be store in either key or extra topic, I wouldn't say either of them is better than the other, really depends on how user's requirement. And no matter what we do, as long as there are number of operators writes to same kafka partition, I'm afraid there is no way to do perfect dedup because we don't know the safe place to do dedup from or too late to do dedup(too much noise from the safe place if other operator instances are fully loaded) I don't remember hashcode, but I think hashcode will include some false positive? And there is other solution like, create topic and number of partitions automatically based on kafka operator instances, in this case, it is much easier, we are always use what messages needs to be dedup because one operator only write to one kafka partition. This solution, my understanding, is most reliable and some user might want it. But the metadata of that kafka topic is kind of automatic created and it's very hard to support dynamic partition in this case. That's the reason why I say there is no general solution for exactly-once kafka output operator. We may need to provide different solutions in "examples" for people to choose from. Anyways, Sandesh, can you wrap up the current solution, post and discuss it in mailing list? | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2283">https://issues.apache.org/jira/browse/APEXMALHAR-2283</a> |
| 20476 | APEXMALHAR-2278 | GitHub user ananthc opened a pull request: <a href="https://github.com/apache/apex-malhar/pull/486">https://github.com/apache/apex-malhar/pull/486</a> APEXMALHAR-2278 Implement KuduNonTransactional Output Operator @tweise / @PramodSSImmaneni : Could you please review or suggest the right person who can complete this review for me? You can merge this pull request into a Git repository by running: \$ git pull https://github.com/ananthc/apex-malhar APEXMALHAR-2278.KuduNonTransactionalOutputOperator Alternatively you can review and apply these changes as the patch at: <a href="https://github.com/apache/apex-malhar/pull/486.patch">https://github.com/apache/apex-malhar/pull/486.patch</a> To close this pull request, make a commit to your master/trunk branch with (at least) the following in the commit message: This closes #486 ---- commit af6944f53c86d0fb355798b9c48d0156964648c9 Author: ananthc <ananth.apex@gmail.com> Date: 2016-11-08T13:28:28Z APEXMALHAR-2278 Implement KuduNonTransactional Output Operator ----                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2278">https://issues.apache.org/jira/browse/APEXMALHAR-2278</a> |
| 20477 | APEXMALHAR-2255 | Is the request to upgrade JDK or upgrade couchbase client library? It seems that it is later. Please update title accordingly and specify upgrade version. Is it backward compatible in a sense that it can be used to connect to older version of couchbase server?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2255">https://issues.apache.org/jira/browse/APEXMALHAR-2255</a> |
| 20478 | APEXMALHAR-2251 | Do you mean Direct or Heap? Majority of the code should work with ByteBuffer and not worry whether it is Direct or Heap allocated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2251">https://issues.apache.org/jira/browse/APEXMALHAR-2251</a> |
| 20479 | APEXMALHAR-2244 | How will the spillable DS know which time bucket to look for a given key in (get)? That's so that we don't look into multiple time buckets since it is not necessary in this case and the number of time buckets can also be high.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2244">https://issues.apache.org/jira/browse/APEXMALHAR-2244</a> |

| 20480 | APEXMALHAR-2223 | Why delay writing to the WAL to endWindow? You get the best throughput by writing the data immediately (asynchronous), unless the same key is updated multiple times in a window. The other question is when the WAL should be flushed (blocking). Does it need to be in endWindow for idempotency or otherwise beforeCheckpoint()?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2223">https://issues.apache.org/jira/browse/APEXMALHAR-2223</a> |
| 20481 | APEXMALHAR-2220 | [~siyuan]I'm not sure where we should merge them into. Should it be a new package? Or should we put them under somewhere under "com.datatorrent.lib.stream"? Please clarify. Thanks!                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2220">https://issues.apache.org/jira/browse/APEXMALHAR-2220</a> |
| 20482 | APEXMALHAR-2220 | [~hsy541] There seems to be a circular dependency problem if we move them to org.apache.apex.malhar.lib it (malhar-library) depends on malhar-stream, however at the same time malhar-stream depends on malhar-library How about we merge them under org.apache.apex.malhar.lib in malhar-stream?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2220">https://issues.apache.org/jira/browse/APEXMALHAR-2220</a> |
| 20483 | APEXMALHAR-2205 | Is it just writing to the WAL or also writing the data files? Any information about key cardinality?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2205">https://issues.apache.org/jira/browse/APEXMALHAR-2205</a> |
| 20484 | APEXMALHAR-2194 | Not clear what the purpose is and why should it be in core? CheckpointNotificationListener is an interface which an operator can implement, begin/endWindow are already there.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2194">https://issues.apache.org/jira/browse/APEXMALHAR-2194</a> |
| 20485 | APEXMALHAR-2193 | @timothyfarkas can you please comment on this issue? Removing entries from ArrayList is expensive, should we use a different data structure?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2193">https://issues.apache.org/jira/browse/APEXMALHAR-2193</a> |
| 20486 | APEXMALHAR-2192 | GitHub user davidyan74 opened a pull request: <a href="https://github.com/apache/apex-malhar/pull/377">https://github.com/apache/apex-malhar/pull/377</a> *Review Only* APEXMALHAR-2192 Added some spillable method implementations This is not ready for merge yet. Please do not comment on missing unit tests, code style, debug statements, etc. @brightchen @ilooner I added removeAll method to SpillableByteArrayListMultimapImpl but the testRemoveAll test method fails. Can you please take a look at what I did wrong? You can merge this pull request into a Git repository by running: \$ git pull <a href="https://github.com/davidyan74/apex-malhar">https://github.com/davidyan74/apex-malhar</a> APEXMALHAR-2192 Alternatively you can review and apply these changes as the patch at: <a href="https://github.com/apache/apex-malhar/pull/377.patch">https://github.com/apache/apex-malhar/pull/377.patch</a> To close this pull request, make a commit to your master/trunk branch with (at least) the following in the commit message: This closes #377 ---- commit f8168445e1f78ca48924a90a2ee0140eb85bde23 Author: David Yan <david@datatorrent.com> Date: 2016-08-22T20:15:36Z added some spillable method implementations ----                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2192">https://issues.apache.org/jira/browse/APEXMALHAR-2192</a> |

Files are then read and split into tuples, which are emitted. The default implementation scans a single directory. The operator is fault tolerant. It tracks previously read files and current offset as part of checkpoint state. In case of failure the operator will skip files that were already processed and fast forward to the offset of the current file. Supports partitioning and changes to number of partitions. The directory scanner is responsible to only accept the files that belong to a partition. + +File Input Operator is **idempotent**, **fault-tolerant** and **partitionable**. + +## Operator Usecase +1. Read all files of a directory and then keep scanning it for newly added files. + +## Operator Information +1. Operator location: ***malhar-library*** +2. Available since: ***1.0.2*** +3. Operator state: ***Stable*** +3. Java Packages: + * Operator: ***[com.datatorrent.lib.io.fs.AbstractFileInputOperator](https://www.datatorrent.com/docs/apidocs/com/datatorrent/lib/io/fs/AbstractFileInputOperator.html)*** + +#### AbstractFileInputOperator +This is the abstract implementation that serves as base class for scanning a directory for files and read the files one by one. This class doesn't have any ports. + +![AbstractFileInputOperator.png](images/fsInput/operatorsClassDiagram.png) + +## Properties, Attributes and Ports +#### &lt;a name="props"&gt;&lt;/a&gt;Properties of AbstractFileInputOperator +  **Property**   **Description**   **Type**   **Mandatory**   **Default Value**   +  -----   -----   ---   ---   -----   +  *directory*   absolute path of directory to be scanned   String   Yes   N/A   +  *scanIntervalMillis*   Interval in milliseconds after which directory should be scanned for new files   int   No   5000   +  *emitBatchSize*   Number of tuples to emit in a batch   int   No   1000   +  *partitionCount*   Desired number of partitions count   int   No   1   +  *maxRetryCount*   Maximum number of times the operator will attempt to process a file   No   5   +  *scanner*   Scanner to scan new files in directory   [DirectoryScanner]{#DirectoryScanner}   No   DirectoryScanner   + +#### &lt;a name="JDBCStore"&gt;&lt;/a&gt;Properties of DirectoryScanner +  **Property**   **Description**   **Type**   **Mandatory**   **Default Value**   +  -----   -----   ---   ---   -----   +  *filePatternRegex*   regex to select files from input directory   String   No   N/A   + +## Abstract Methods +void emit(T tuple): Abstract method that emits tuple read from file. +T readEntity(): Abstract method to read file entity (can be a line or block). + +## Partitioning of File Input Operator +Configure parameter "partitionCount" to define desired number of partitions. + +`xml` + &lt;property&gt; + &lt;name&gt;dt.operator.{OperatorName}.prop.partitionCount&lt;/name&gt; + &lt;value&gt;4&lt;/value&gt; + &lt;/property&gt; +` ` + +where {OperatorName} is the name of the input operator. +Above lines will partition operator statically 4 times. Above value can be changed accordingly to change the number of static partitions. + +#### Dynamic Partitioning of JDBC Poller +Implement ``getNewPartitionCount()`` method to do dynamic partitioning. + +## Derived Classes +#### 1. AbstractFTPInputOperator +The class is used to read files from FTP file system. +#### Properties, Attributes and Ports --- End diff --- I don't see any ports mentioned; if there are none, please add a note saying something like: "This operator has no ports" in each case. Also, is there any reason to mention attributes since they are not operator specific ? </p> | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2184">https://issues.apache.org/jira/browse/APEXMALHAR-2184</a> |

This class doesn't have any ports. --- End diff --- Add an overview here of what the operator does here, what parts need to be implemented by concrete subclasses and show code fragments for example from the LineByLine operator. Describe what the DirectoryScanner does. Some obvious questions that will come up in the reader's mind should be answered, for example: 1. What happens if a file that has already been processed has new data appended to it ? 2. What happens if a processed file is deleted ? 3. What happens if a separate actor is in the process of writing a new file in the monitored directory ? How will this operator know when the file is ready to be read ? 4. What if the number of files in the scanned directory grows over time to be very large -- what impact, if any, does it have on this operator ? 5. Can this operator be used to monitor multiple directories ? (Point people to the fileIO-multidir example) 6. This class already implements the Partitioner interface; can a custom partitioner be set on this operator ? More generally, since we are saying this operator supports dynamic partitioning, it is useful to describe (with a code fragment if possible) how to trigger it.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2184">https://issues.apache.org/jira/browse/APEXMALHAR-2184</a> |

Is this because the poll interval is sufficiently long so as to prevent multiple calls to ""pollRecords()"" within a single window? Even in that case, if the poll interval is reduced, there might be multiple calls where only one call will happen in this case. </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2172">https://issues.apache.org/jira/browse/APEXMALHAR-2172</a> |

""pollRecords()"" is just fetching ""fetchSize"" records and making ""isPolled = true"". This way non-poller partitions only fetch ""fetchSize"" records. </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2172">https://issues.apache.org/jira/browse/APEXMALHAR-2172</a> |

| #     | Requirement     | Questions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | URL                                                                                                                       |

| 20509 | APEXMALHAR-2162 | [~thomasWeise] We can use this in KafkaOutputOperatorTest but not in KafkaInputOperatorTest. Because, EmbeddedZookeeper supports only for single cluster. It doesn't work for multiple clusters. So, this can't be used it for multi-cluster test cases which are present in KafkaInputOperatorTest. Is it fine to add it only in KafkaOutputOperatorTest ?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2162">https://issues.apache.org/jira/browse/APEXMALHAR-2162</a> |
| 20510 | APEXMALHAR-2162 | Why can we not use multiple embedded zookeepers with different ports when the goal is to simulate multiple clusters?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2162">https://issues.apache.org/jira/browse/APEXMALHAR-2162</a> |

| 20525 | APEXMALHAR-2153 | <p>docs/operators/enricher.md --- @@ -0,0 +1,169 @@ +POJO Enricher +===== + +## Operator Objective +This operator receives an POJO ([Plain Old Java Object](https://en.wikipedia.org/wiki/Plain_Old_Java_Object)) as an incoming tuple and uses an external source to enrich the data in +the incoming tuple and finally emits the enriched data as a new enriched POJO. + +POJOEnricher supports enrichment from following external sources: + +1. **JSON File Based** - Reads the file in memory having content stored in JSON format and use that to enrich the data. This can be done using FSLoader implementation. +2. **JDBC Based** - Any JDBC store can act as an external entity to which enricher can request data for enriching incoming tuples. This can be done using JDBCLoader implementation. + +POJO Enricher does not hold any state and is **idempotent**, **fault-tolerance** and **statically/dynamically partitionable**. + +## Operator Usecase +1. Bank ***transaction records*** usually contains customerId. For further analysis of transaction one wants the customer name and other customer related information. +Such information is present in another database. One could enrich the transaction's record with customer information using POJOEnricher. +2. ***Call Data Record (CDR)*** contains only mobile/telephone numbers of the customer. Customer information is missing in CDR. POJO Enricher can be used to enricher +CDR with customer data for further analysis. + +## Operator Information +1. Operator location: ***malhar-contrib*** +2. Available since: ***3.4.0*** +3. Operator state: ***Evolving*** +3. Java Packages: + * Operator: ***[com.datatorrent.contrib.enrich.POJOEnricher](https://www.datatorrent.com/docs/apidocs/com/datatorrent/contrib/enrich/POJOEnricher.html)*** + * FSLoader: ***[com.datatorrent.contrib.enrich.FSLoader](https://www.datatorrent.com/docs/apidocs/com/datatorrent/contrib/enrich/FSLoader.html)*** + * JDBCLoader: ***[com.datatorrent.contrib.enrich.JDBCLoader](https://www.datatorrent.com/docs/apidocs/com/datatorrent/contrib/enrich/JDBCLoader.html)*** + +## Properties, Attributes and Ports +### &lt;a name="props"&gt;&lt;/a&gt;Properties of POJOEnricher +  **Property**   **Description**   **Type**   **Mandatory**   **Default Value**   + ----- ----- ----- ----- -----  +  *includeFields*   List of fields from database that needs to be added to output POJO.   List&lt;String&gt;   Yes   N/A   +  *lookupFields*   List of fields from input POJO which will form a *unique composite* key for querying to database   List&lt;String&gt;   Yes   N/A   +  *store*   Backend Store from which data should be queried for enrichment   [BackendStore][#backendStore]   Yes   N/A   +  *cacheExpirationInterval*   Cache entry expiry in ms. After this time, the lookup to store will be done again for given key   int   No   1 * 60 * 60 * 1000 (1 hour)   +  *cacheCleanupInterval*   Interval in ms after which cache will be removed for any stale entries.   int   No   1 * 60 * 60 * 1000 (1 hour)   +  *cacheSize*   Number of entry in cache after which eviction will start on each addition based on LRU   int   No   1000   + +### &lt;a name="backendStore"&gt;&lt;/a&gt;Properties of FSLoader (BackendStore) +  **Property**   **Description**   **Type**   **Mandatory**   **Default Value**   + ----- ----- ----- ----- -----  +  *fileName*   Path of the file, the data from which will be used for enrichment. See [here](#JSONFileFormat) for JSON File format.   String   Yes   N/A   + + +### Properties of JDBCLoader (BackendStore) +  **Property**   **Description**   **Type**   **Mandatory**   **Default Value**   + ----- ----- ----- ----- -----  +  *databaseUri*   Connection string for connecting to JDBC   String   Yes   N/A   +  *databaseDriver*   JDBC Driver class for connection to JDBC Store. This driver should be there in classpath   String   Yes   N/A   +  *tableName*   Name of the table from which data needs to be retrieved   String   Yes   N/A   +  *connectionProperties*   Command seperated list of advanced connection properties that need to be passed to JDBC Driver. For eg. *prop1:val1,prop2:val2*   String   No</p> | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2153">https://issues.apache.org/jira/browse/APEXMALHAR-2153</a> |
| 20526 | APEXMALHAR-2130 | <p>What's the use case? I think this needs a clearer explanation as to what the purpose of the proposed feature is. We do have managed state and on top of it abstractions to plug it into operators: <a href="https://github.com/apache/apex-malhar/tree/master/library/src/main/java/org/apache/apex/malhar/lib/state/">https://github.com/apache/apex-malhar/tree/master/library/src/main/java/org/apache/apex/malhar/lib/state/</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2130">https://issues.apache.org/jira/browse/APEXMALHAR-2130</a> |
| 20527 | APEXMALHAR-2130 | <p>Here are some thoughts to implement it based on state manager - Use one bucket only, use the Event Window and Key to generate key for the bucket, and use Stream Window as timeBucket. The problem of this approach is get the whole map of one Event window as it lack of key. Is possible the client code get value by Event Window and key instead of get whole map? - One Event window map to one bucket, and Stream window id as timeBucket. But the problem is the size of Event Window are variable and could be huge. and also the Event window size are vary. So this approach probably not doable. - One Streaming window map to a bucket. It will have problem to map Event window. And also have problem get whole map by Event Window, as we don't know which bucket to read the data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2130">https://issues.apache.org/jira/browse/APEXMALHAR-2130</a> |

| 20529 | APEXMALHAR-2130 | <p>[~davidyan] As far I can tell what you have implemented on top of spillable datastructures is 95% of the way there. I'm not sure what has changed. 1. SpillableByteMap already supports deleting a key by setting the value for a key to be an empty byte array. So that's there. This can easily be extended to delete all the values in SpillableArrayListMultimap. 2. The only missing piece is the ability to iterate over the set of keys in a map. This can be done with another SpillableByteMap let's call this map the linkedListMap. The key of the linkedListMap represents the current node, the value represents the next node. You then keep track of your "head" key and iterate by taking your current node, and getting the value. The value then becomes the current node and so on. When the value for the current node is null you are done traversing the list. You can take this and wrap it in an iterator.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2130">https://issues.apache.org/jira/browse/APEXMALHAR-2130</a> |
| 20530 | APEXMALHAR-2130 | <p>Which keys belong to which window can be seen as derived information when using a key in managed state that is &lt;window&gt;&lt;key&gt;. We can then retrieve all keys for a given window by doing a prefix scan for &lt;window&gt;. This becomes difficult however when including the state that wasn't flushed to the data files yet (they are compacted asynchronously). Using another spillable datastructure to store the keys for each window is possible, but also comes with drawbacks, since it duplicates information. Once of them is obviously performance, since it is increasing the HDFS usage. It also needs to use the same store, as otherwise there is the situation of two resources that need to be updated atomically. Assuming that both collections can use the same store (key prefix) and share the same WAL and data files, then we need to see whether time based purging will still work as intended. David?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2130">https://issues.apache.org/jira/browse/APEXMALHAR-2130</a> |
| 20531 | APEXMALHAR-2129 | Please explain the requirement and why is it needed? This helps with purging of data. How will you purge data?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2129">https://issues.apache.org/jira/browse/APEXMALHAR-2129</a> |
| 20532 | APEXMALHAR-2126 | <p>Why is it necessary to have Slice here? Slice allows referring to a portion of byte array without allocating individual byte arrays and creating many byte array objects. The example tries to solve a completely different problem - concatenate existing byte arrays into a single large byte array. There is no need for Slice here at all and Slice is misused in SpillableByteMapImpl. Instead of using Slice, it will be better to use Collection (for example ArrayList) of identifiers and serialized keys pairs and create byte array after all pairs are added to the collection.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2126">https://issues.apache.org/jira/browse/APEXMALHAR-2126</a> |

You can refer to POJOEnricher setIncludeFields setter method for this. </pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2111">https://issues.apache.org/jira/browse/APEXMALHAR-2111</a> |
| 20542 | APEXMALHAR-2106 | Should this of type be improvement?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2106">https://issues.apache.org/jira/browse/APEXMALHAR-2106</a> |
| 20543 | APEXMALHAR-2106 | <p>GitHub user ilganeli opened a pull request: <a href="https://github.com/apache/incubator-apex-malhar/pull/307">https://github.com/apache/incubator-apex-malhar/pull/307</a> [APEXMALHAR-2106] Support multiple streams in StreamMerger</p> <p>* Added ability to support more than one stream in the operator Note: I am unclear whether this approach will work if the operator or the DAG restarts, will the ports be reconnected properly? If not, what mechanism prevents this? You can merge this pull request into a Git repository by running: \$ git pull <a href="https://github.com/ilganeli/incubator-apex-malhar/pull/307.patch">https://github.com/ilganeli/incubator-apex-malhar/pull/307.patch</a> Alternatively you can review and apply these changes as the patch at: <a href="https://github.com/apache/incubator-apex-malhar/pull/307.patch">https://github.com/apache/incubator-apex-malhar/pull/307.patch</a> To close this pull request, make a commit to your master/trunk branch with (at least) the following in the commit message: This closes #307 ---- commit 5a486ff777c3b5c41fa2cbbff7a196bc9da18a44 Author: Ilya Ganelin &lt;ilya.ganelin@capitalone.com&gt; Date: 2016-06-01T23:36:49Z Initial implementation of a Stream merger operator that can handle more than two input streams. Updated test cases ----</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2106">https://issues.apache.org/jira/browse/APEXMALHAR-2106</a> |

| 20555 | APEXMALHAR-2102 | I've been looking into the code. It seems that a lot of the logic within the StatelessPartitioner would go away in a ClonePartitioner. Is there any issue with assigning an identical set of PartitionKeys to each input port / partition combination? Does there even need to be more than one key for other logic to work? Repartitioning logic becomes somewhat undefined. It doesn't make sense to partition based on load, I think the only function needed is the definePartitions() function which simply assigns an arbitrary key assignment to each partition, e.g. a 0 key. Is my understanding correct?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2102">https://issues.apache.org/jira/browse/APEXMALHAR-2102</a> |
| 20556 | APEXMALHAR-2102 | <p>GitHub user ilganeli opened a pull request: <a href="https://github.com/apache/incubator-apex-core/pull/344">https://github.com/apache/incubator-apex-core/pull/344</a> [APEXCORE-146] Add ClonePartitioner * Created a Clone partitioner similar to the StatelessPartitioner that assigns all data to all partitions * Added a simple unit test suite to test scale up and scale down **Questions** Is there a good place/way to add a test to verify that data is partitioned appropriately? For example, the stateless partitioner assigns keys based on the nearest power of two - is that validated anywhere? How is the serialVersionUUID generated? Does the manual assignment of ports to PartitionKeys need to happen for each Partition? There is a comment in the Partition class that by default all data is sent to all partitions. However, digging into the implementation in depth doesn't show that behavior. Instead, it seems data is assigned based on the mask associated with each Partition. What is the intended structure?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2102">https://issues.apache.org/jira/browse/APEXMALHAR-2102</a> |
| 20559 | APEXMALHAR-2102 | <p>Github user twice commented on the pull request: <a href="https://github.com/apache/incubator-apex-core/pull/344#issuecomment-221943349">https://github.com/apache/incubator-apex-core/pull/344#issuecomment-221943349</a> @ilganeli I also think this should go into Malhar. The stateless partitioner is directly used by the engine, hence it is in common. Should I move the JIRA to APEXMALHAR?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2102">https://issues.apache.org/jira/browse/APEXMALHAR-2102</a> |
| 20560 | APEXMALHAR-2102 | <p>Github user ilganeli commented on the pull request: <a href="https://github.com/apache/incubator-apex-core/pull/344#issuecomment-221969005">https://github.com/apache/incubator-apex-core/pull/344#issuecomment-221969005</a> @twice Sure, let's move the JIRA to Malhar and I'll move the class to Malhar. Is the approach sound?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2102">https://issues.apache.org/jira/browse/APEXMALHAR-2102</a> |

| 20561 | APEXMALHAR-2102 | <p>GitHub user ilganeli opened a pull request: <a href="https://github.com/apache/incubator-apex-malhar/pull/297">https://github.com/apache/incubator-apex-malhar/pull/297</a> [APEXCORE-146] Add ClonePartitioner <b>Note:</b> This is still marked as an Apex issue even though it should live in Malhar. Once the JIRA is updated I'll update title and reference. <b>Created</b> a Clone partitioner similar to the StatelessPartitioner that assigns all data to all partitions <b>Added</b> a simple unit test suite to test scale up and scale down <b>Questions</b> Is there a good place/way to add a test to verify that data is partitioned appropriately? For example, the stateless partitioner assigns keys based on the nearest power of two - is that validated anywhere? How is the serialVersionUID generated? Does the manual assignment of ports to PartitionKeys need to happen for each Partition? There is a comment in the Partition class that by default all data is sent to all partitions. However, digging into the implementation in depth doesn't show that behavior. Instead, it seems data is assigned based on the mask associated with each Partition. | 20575 | APEXMALHAR-2099 | The biggest lack we presently have seems to be GroupByKey. Implementing GroupByKey will need either a new operator (that emits a map of {Key -> List[Value]} on window boundaries) or a pairing with the ApexStream implementation (that an incoming stream is split up into multiple new streams) (Preferred). Implementing the flatten operator should be straightforward. In terms of windowing and triggering, I think Siyuan's present API which provides the "with" construct, should be more than sufficient for specifying windowing or trigger semantics that can then be translated by the ApexStream implementation. [~thw][~siyuan] Thoughts? Which route would you recommend?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2099">https://issues.apache.org/jira/browse/APEXMALHAR-2099</a> |
| 20576 | APEXMALHAR-2099 | [~ilganeli] When we started working on high level API, we asked the question. We already have Operator API which supports a much greater variety of transformations, why do we need high-level API which would definitely sacrifice some sort of flexibility. Beam API is kind of in the middle of low level API like our Operator API and some high level API like Flink/Spark. A main reason is we want to make another API that is easy to start with and also easy to use in most cases. Flink, Spark and even JDK 8 pick same flavour for some reason. Think about some developer who's new to parallel stream processing. How can they find out which existing transformation library fit into their needs? By search for all sub classes of PTransform and use apply, apply, apply to chain them together or look at the first-order self-descriptive methods(map, filter, flatmap...) in one class? If I'm a beginner I definitely prefer the facade pattern. I'm not saying Beam API is ugly, if they can have only one API. They have no choice but the full flexibility to support Google Data Flow Model.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2099">https://issues.apache.org/jira/browse/APEXMALHAR-2099</a> |

| 20582 | APEXMALHAR-2094 | Sandeep, are you planning to add more functionality based on the datasketches library? If so, would it make sense to create a separate module for it?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2094">https://issues.apache.org/jira/browse/APEXMALHAR-2094</a> |
| 20583 | APEXMALHAR-2094 | Thomas Weise Thomas, I do intend to add more functionality. DataSketches includes algorithms like hyperloglog, and heavy hitters / frequent items and a "theta sketch" framework that will allow set operations on multiple streams, and I want to build Apex operators for each of these. By "module", do you mean a package like {{statistics}} or {{algo}} in the Malhar library? If so, yes, it might make sense to move this operator from {{statistics}} into a {{sketches}} package that will encapsulate all stream sketching algorithms.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2094">https://issues.apache.org/jira/browse/APEXMALHAR-2094</a> |
| 20584 | APEXMALHAR-2094 | [~thw] Thomas, I created a new "sketches" module. However, working in this module, IntelliJ is unable to import com.datarorrent.lib.util.TestUtils even though the sketches pom.xml contains malhar-library as a dependency. Where should this be imported from?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2094">https://issues.apache.org/jira/browse/APEXMALHAR-2094</a> |

| 20604 | APEXMALHAR-2085 | I'm in the process of designing the API. I would like to start a quick discussion on whether we should use API from other libraries for our API. We already know that we need interfaces for things like the window policy, the triggering policy, the storage, the aggregation, functions that extract timestamp and key, etc. There are interfaces from Beam, Guava, etc., that let you specify some of those things. Some of them are complex (like windowing policy) and some of them are simple (like the function interface). Should we mirror (or duplicate) their interfaces in our API or just use their interfaces directly? Please provide your feedback.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2085">https://issues.apache.org/jira/browse/APEXMALHAR-2085</a> |

But in some cases, the accumulated type and the output type may be +* different. For example, if we are doing the AVERAGE of doubles, InputT will be double, and we need the SUM and the +* COUNT stored as type AccumT, and AccumT will be a pair of double and long, in which double is the sum of the inputs, +* and long is the number of inputs. OutputT will be double, because it represents the average of the inputs. +*/ +@InterfaceStability.Evolving +public interface Accumulation&lt;InputT, AccumT, OutputT&gt; +{ + /** + * Returns the default accumulated value when nothing has been accumulated + * + * @return + */ + AccumT defaultAccumulatedValue(); + + /** + * Accumulates the input to the accumulated value + * + * @param accumulatedValue + * @param input + * @return + */ + AccumT accumulate(AccumT accumulatedValue, InputT input); --- End diff -- What is the reason to make the interface stateless? Should it be stateful? My concern is with the interface promoting boxing/unboxing pattern and leading to an excessive GC.</pre>                                                                                                                                                                                                                                                                                                                                                                                             | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2085">https://issues.apache.org/jira/browse/APEXMALHAR-2085</a> |

| 20614 | APEXMALHAR-2077 | Can we not add a property to the base class to toggle this behavior ? That way, we avoid creating a whole new class whose only point is to add a property.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2077">https://issues.apache.org/jira/browse/APEXMALHAR-2077</a> |

Will the data be distributed over multiple data files, partitioned by time?</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2070">https://issues.apache.org/jira/browse/APEXMALHAR-2070</a> |
| 20616 | APEXMALHAR-2069 | These are the default values which are assigned in the constructor. It is not evident to me that why these should be done during operator setup(). Can you please explain?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2069">https://issues.apache.org/jira/browse/APEXMALHAR-2069</a> |

Under what condition it will be not null? As far as I know platform calls setup/terminate once per deployment. IMO, it is safer to create new execution service each time setup is called and possibly assert or throw RuntimeException if scanService is not null to avoid misusage in unit tests.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2069">https://issues.apache.org/jira/browse/APEXMALHAR-2069</a> |
| 20618 | APEXMALHAR-2069 | Github user chandnisingh commented on a diff in the pull request: <a href="https://github.com/apache/apex-malhar/pull/333#discussion_r69828207">https://github.com/apache/apex-malhar/pull/333#discussion_r69828207</a> --- Diff: library/src/test/java/com/datarorrent/lib/io/fs/FileSplitterInputTest.java --- @@ -499,7 +499,7 @@ public void testRecoveryOfBlockMetadataalterator() throws InterruptedException testMeta.fileSplitterInput.getScanner().setScanIntervalMillis(500); - testMeta.fileSplitterInput.setup(testMeta.context); --- End diff -- The goal of writing tests is to test the operator not just setup of window data manager. For a trivial improvement, that is, to avoid instantiating objects in the logical instance, this change now doesn't execute setup of the operator which is a much bigger problem. In future if something is added to splitter setup, the test will never execute it and result in bugs. Also, there are multiple of operators in library which instantiate field that are transient when the operator is constructed. Are you going to change all of them?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2069">https://issues.apache.org/jira/browse/APEXMALHAR-2069</a> |
| 20619 | APEXMALHAR-2069 | Github user sanjaypujare commented on a diff in the pull request: <a href="https://github.com/apache/apex-malhar/pull/333#discussion_r69834329">https://github.com/apache/apex-malhar/pull/333#discussion_r69834329</a> --- Diff: library/src/test/java/com/datarorrent/lib/io/fs/FileSplitterInputTest.java --- @@ -499,7 +499,7 @@ public void testRecoveryOfBlockMetadataalterator() throws InterruptedException testMeta.fileSplitterInput.getScanner().setScanIntervalMillis(500); - testMeta.fileSplitterInput.setup(testMeta.context); --- End diff -- For the first point, we can (should) add another unit test just to test FileSplitterInput.setup() which in any case sounds like a better idea. The 2nd point is not very clear. Are you saying there are many other instances of non-transient fields which should be checked for null in setup() or are you saying there are many fields which should ideally be declared transient?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <a href="https://issues.apache.org/jira/browse/APEXMALHAR-2069">https://issues.apache.org/jira/browse/APEXMALHAR-2069</a> |
