15675	MODE-1310	Do we need to create an adapter layer for older sequencers, or should we just expect users to convert their custom sequencers?	1	1	https://issues.jboss.org/browse/MODE-1310
15676	MODE-1304	Since the PR has been merged, do we still need this open ?	1	1	https://issues.jboss.org/browse/MODE-1304
15677	MODE-1295	Updated code based on the above points as follows: 1. done 2. those tests are still excluded from modeshape 2.x. For 3.x. and JR all tests are being run 3. binary tests were added back, but will still be reported as failed until MODE-1308 is fixed 4. added warmup count setting. Default value of 5 5. done 6. added a sample report which generates a simple bar chart with the values for each test. We need to define exactly what other reports we want and how they should look. Also, modeshape-connector-benchmark it seems only does a println - nothing more - although there is some code commented out 7. TDB: where should I add this ? 8. that's definitively an option, and the reason why I avoided any modeshape specific dependencies in the api. I would say let's do it. 9. done - added a new test suite where anonymous sessions are created 10. done - added a new test suite where authenticated test session are created (however, the passed Credentials should match the ones with which the repo is configured)	1	1	https://issues.jboss.org/browse/MODE-1295
15678	MODE-1295	Is there a way to add the files in the new repo while preserving the history ?	1	1	https://issues.jboss.org/browse/MODE-1295
15679	MODE-1295	Merged the pull-request into the 'master' branch of the new 'modeshape-performance' repository. One last thing: can you update the 'README.md' file with a description of this framework and how to use it? For example, what each module represents, how to add other impls and/or versions, what commands to run, and where the results are.	1	1	https://issues.jboss.org/browse/MODE-1295
15680	MODE-1291	MODE-1581 recently added a 'getAllBinaryKeys()' method to the BinaryStore interface (needed for the backup and restore functionality). When I merged these changes, I simply stubbed out this method. [~tfromm], can you implement this method? Please see the new InfinispanUtil class for a utility method to find all the keys for a Cache (which should be enhanced with your technique of using the CacheLoader directly to get the keys for a local, persisted cache).	1	1	https://issues.jboss.org/browse/MODE-1291

15682	MODE-1285	Can you explain why this would be helpful?	1	1	https://issues.jboss.org/browse/MODE-1285
15683	MODE-1252	Not sure I understand why REPOSITORY_NAME should be deprecated in 2.x: we could just change getRepository(Map parameters) to do an additional search in the Map for the REPOSITORY_NAME key and if that is present, use it instead of parsing the URL. If it's not present, just default to what the current code is. For 3.x, do we still need the JcrRepositoryFactory#getRepository(String jcrUrl, String repositoryName) method ?	1	1	https://issues.jboss.org/browse/MODE-1252
15684	MODE-1233	See MODE-1231 for the fix in the branch used in the 5.2 product branch.	1	1	https://issues.jboss.org/browse/MODE-1233
15685	MODE-1233	Can the fix not work for both branches?	1	0	https://issues.jboss.org/browse/MODE-1233
15686	MODE-1231	Is this only a problem when the sequence is being created?	1	0	https://issues.jboss.org/browse/MODE-1231
15687	MODE-1226	Perhaps the largest issue I can think of is deciding what the semantics should be with respect to children. Initially, having the client application be responsible for manually detaching all nodes they care about seems to make sense. But if a client detaches a parent node and all of its child nodes, would the detached parent node be able to find the child nodes via the 'getNodes()' and related methods?	0	0	https://issues.jboss.org/browse/MODE-1226
15688	MODE-1218	I'm not sure I really see the advantage of the {{ant start.demo}} or {{ant stop.demo}}. Seems really strange to have a script just to start the server _and_ Eclipse. Is this issue even needed anymore?	0	0	https://issues.jboss.org/browse/MODE-1218
15689	MODE-1205	Could you please clarify the difference between this and MODE-1107? Thanks!	0	0	https://issues.jboss.org/browse/MODE-1205
15690	MODE-1187	This feature is now supported in ModeShape 3.0 with the new JCR design. In fact, the nodes within the '/jcr:system' branch are already using non-UUID identifiers.	0	0	https://issues.jboss.org/browse/MODE-1187
15691	MODE-1157	We're approaching our Beta3 release date (hopefully late next week), and I'd like to see this merged into the 'master' branch. But frankly, I'm concerned about this feature getting in without simultaneously updating the Reference Guide. I have no doubt that your code review is good. IMO, once a feature is implemented, the unit/integration tests help us catch regressions in behavior, and without tests I'm just not confident that we won't mistakenly break this feature in the future when working on this class (and the Hibernate configuration code). Is there a reason we can set up an integration test to instantiate the JBoss Transaction Manager, register a JTA DataSource (e.g., HSQLDB), run our integration tests? See http://community.jboss.org/message/592630#592630 for the Maven dependencies used in Infinispan tests.	0	0	https://issues.jboss.org/browse/MODE-1157

#	Requirement	Questions	Answered	Successfully Answered	URL
15692	MODE-1157	Let me apologize up front for being so difficult about this change. My concern is that if we merge these changes into 'master' without the corresponding changes to make ModeShape JTA compatible (MODE-1123), we will actually cause some strange and IMO wrong behavior when ModeShape is used within (or with) user transactions. IIUC, prior to these changes it was not possible for ModeShape to use a JDBC DataSource that was set up as an XA resource. With these changes, it will be possible to do this, allowing the client (or more strictly speaking the JTA transaction) to dictate when changes are persisted in the database using JTA user transactions. For example, a client could do the following (or something equivalent within an EJB-land where the container manages transaction boundaries): # being the user transaction # make changes to a workspace using a session # save the session # commit the user transaction The crux of my concern is that ModeShape still thinks that the information is being saved to the store in #3 above, and will fire the change events. However, because the information is actually not persisted in the store until #4, we're firing events too early and we're updating the indexes too early. This might not be a (too much of a) problem in the nominal case, but actually can cause a lot of problems in two other situations. The first is when there are multiple saves on a single session within a single user transaction: # being the user transaction # make changes to a workspace using a session # save the session # make more changes to a workspace using a session # save the session # commit the user transaction At the end of Step 3, ModeShape will fire events (to all observers) that reflect the changes made in step 2. Then, at the end of Step 5, ModeShape will fire events (to all observers) that reflect the changes made in step 4. However, none of these changes were persisted in the store, and none will actually be visible to any other sessions. And because our query indexes are updated based upon events, we'll actually update our query indexes at step 3 and 5 above. Again, this leaks information out of the transaction, making it visible to other sessions and actually exposing incorrect data. Then what happens if the user transaction is rolled back rather than committed? # being the user transaction # make changes to a workspace using a session # save the session # **rollback the user transaction** At this point, after step 3 completes, ModeShape will fire the events and will (asynchronously) update the query indexes to reflect the changes made in step 2 and saved in step 3. But if the transaction is rolled back in step 4, the changes were not actually persisted in the store and thus the fired events and the query indexes are all flat out wrong. So if the above is accurate (and there's a fair possibility it is not), then it actually could be very problematic to merge these changes into 'master' without also making the rest of the changes for JTA support (MODE-1123). I'd be fine doing that, if the rest of the changes were going to happen in the same release. But it doesn't look like the rest of the MODE-1123 changes will be ready, as we're planning to release 2.5.0.Beta3 very soon (next week) and 2.5.0.Final very quickly after that (e.g., a week later). Please let me know if I'm missing something.	0	0	https://issues.jboss.org/browse/MODE-1157
15693	MODE-1150	BTW Randall... since it's JBoss.. do you plan to switch to JBoss Logging or stick to SLF4J ?	1	1	https://issues.jboss.org/browse/MODE-1150
15694	MODE-1132	Is this still targeted for 2.5.1.GA?	0	0	https://issues.jboss.org/browse/MODE-1132
15695	MODE-1122	Posted a pull request at https://github.com/ModeShape/modeshape/pull/64 that includes a proposed code change. If the change looks good, I can submit a new patch that also updates the reference guide to describe this behavior. Was the intent to also do this for JaasCredentials and SecurityContextCredentials?	1	1	https://issues.jboss.org/browse/MODE-1122
15696	MODE-1122	I think this should work the same way for all credentials. Do you think this behavior should be configurable? On one hand, it seems useful to always get anonymous access to the content if authentication fails. But on the other hand, you'll never know that your credentials were invalid, so an application that expects a user to log in will not be able to enforce authentication without completely disabling anonymous logins.	1	1	https://issues.jboss.org/browse/MODE-1122
15697	MODE-1116	We'll have to decide which of these should be made into OSGi bundles. All of them? Do the documentation modules really need to be OSGi-enabled?	1	1	https://issues.jboss.org/browse/MODE-1116
15698	MODE-1116	Do you want to create a pull-request from your GitHub fork and set the URL on this issue?	1	1	https://issues.jboss.org/browse/MODE-1116
15699	MODE-1098	Are these environment or system properties?	1	1	https://issues.jboss.org/browse/MODE-1098
15700	MODE-1091	This should be a pretty quick and easy fix. Targeting for 2.5.0.Beta1. Dmitri, would you mind specifying exactly what you changed with the Hibernate properties to specify the schema? Is it just the "hibernate.default_schema" property?	0	0	https://issues.jboss.org/browse/MODE-1091
15701	MODE-1081	What if we add those JARs in Nexus with an "unsigned" classifier ? Then ModeShape could use this classifier. What do you think ?	1	1	https://issues.jboss.org/browse/MODE-1081
15702	MODE-1075	I think that the MODE-456 fix addresses this, although it would require you to make your sequencer output path the same (or a subpath of) your sequencer input path. WDYT?	1	0	https://issues.jboss.org/browse/MODE-1075
15703	MODE-1075	Hey, I implemented sequencing as it was meant to be, different node for sequencing output, but now I find it complicates things and I rather have the output properties on the sequenced file. I'm not sure what the drawbacks could be though. Is there a resolution for this feature request ?	0	0	https://issues.jboss.org/browse/MODE-1075
15704	MODE-1051	Thanks, Edouard. Can you clarify for me what the problem or error actually is? The text above seems to imply that ModeShape does indeed make '/A/X' appear in the result set for your query, but '/B/X' does not. Am I reading that correctly? Is your test case failing, and if so on which line? (If you are testing with Jackrabbit, it'd be very interesting to note where your test case fails when running against Jackrabbit.)	1	1	https://issues.jboss.org/browse/MODE-1051
15705	MODE-1051	So the first query works (when using ModeShape) and the results are what the test case expects, but the second query does not work for ModeShape. Is that correct? As we've discussed in the discussion thread (see link above), I believe that this behavior matches the JCR 2.0 specification. Even though the specification gives a fair amount of room for implementations (and doesn't fully specify the expected behavior in a case like this), IMO the shareable nodes feature as described in the specification really isn't consistent with the query feature. Having said, to date we've chosen to implement ModeShape such that the shared nodes (created by the cloning process within a single workspace) are not visible to the query engine. Only doing this can ModeShape be consistent with the shareable nodes and query features as described in the specification. (Yes, this is in part due to the implementation details of these features, but that's what we have to work with at this time.)	0	0	https://issues.jboss.org/browse/MODE-1051
15706	MODE-1033	I'm wondering if the StreamSequencerAdapter should, as it looks at the existing content (to find the appropriate SNS index for the top-level nodes generated by the sequencing operation) should also look for and remove existing content in the output location that was also (previously) derived from the same node currently being sequenced. In other words, the new derived output would **replace* the content previously-derived from the same input. If so, should this always be done, or should this be driven by the specific sequencer configuration? (ATM, I'm leaning toward always doing this.)	1	1	https://issues.jboss.org/browse/MODE-1033
15707	MODE-1028	would it be possible to link the node back to the sequenced nodes via a correlation of related UUIDs?	1	1	https://issues.jboss.org/browse/MODE-1028

#	Requirement	Questions	Answered	Successfully Answered	URL
15708	MODE-1028	MODE-1033 does this indirectly via a PATH property on the derived (sequenced) information. We could store the UUID as a STRING property, but in order to use a REFERENCE (on the derived content or the sequenced file) we'd need one of them to be 'mix:referenceable'. I originally thought that when a file is deleted, we could easily query for 'mix:derived' with a 'mix:derivedFrom' property with a path matching the 'nt:file' node being deleted. Technically, this is very easy to do. The harder part, IMO, is the broader issue of where this logic should live? Should it live in the REST client (in the unpublish method)? Should it live in the JCR engine? Should it be implemented as an event listener (observer) that is added to the engine, perhaps defined/added in the configuration?	0	0	https://issues.jboss.org/browse/MODE-1028
15709	MODE-1027	should this maybe be incorporated in to MODE-888?	1	1	https://issues.jboss.org/browse/MODE-1027
15710	MODE-1019	My guess that it is easier to start of having it all in one file (inline). Is it hard to support both?	1	1	https://issues.jboss.org/browse/MODE-1019
15711	MODE-1011	Having one last difference, the DataBaseMetadata returned for getColumnType() is 'Name', but for the same column in the ResultSetMetaData getColumnType(), it returns 'String'. I noticed in the NodeTypeSchemata: types.put(PropertyType.NAME, typeSystem.getStringFactory().getTypeName()); For column types of 'Path', it's returned in both cases, and has a typeSystem.getPathFactory(). Should there be a typeSystem.getNameFactory() for 'Name' type and be return the 'Name' type in query results?	1	1	https://issues.jboss.org/browse/MODE-1011
15712	MODE-1011	TypeSystem does have this method: TypeFactory<?> getPathFactory(); Should that be removed and change the NodeTypeSchemata to use a string factory instead?	1	1	https://issues.jboss.org/browse/MODE-1011
15713	MODE-999	I thought the SLF4J JAR was to be excluded because it is already available on the global classpath. Is that true, Van?	1	1	https://issues.jboss.org/browse/MODE-999
15714	MODE-995	The properties shown represent all available descriptors for the JCR repository. Source is not exposed via a descriptor. Should source be added?	0	0	https://issues.jboss.org/browse/MODE-995
15715	MODE-943	[~rhauch]: this issue is almost 4 years old and I can barely find any information online about {{JSOP}}. Is there any benefit in keeping this open ? {{JSOP}} seems quite "dead" to me (and if it's not dead, then I don't really see it as a wide-spread standard)	0	0	https://issues.jboss.org/browse/MODE-943
15716	MODE-940	Should this read: implement SVN connector for 3.x ?	1	0	https://issues.jboss.org/browse/MODE-940
15717	MODE-939	The system workspace is not exposed through the JCR Workspace.getAvailableWorkspaceNames(), nor is it included in the list returned by the REST service. (This is true even when the SYSTEM_SOURCE_NAME is set to a workspace in the same source that the repository uses.)	0	0	https://issues.jboss.org/browse/MODE-939
15718	MODE-930	Changed the title to remove the notion of a User Defined Function (UDF), which I had originally suggested because I thought the use case just involved changing the results of a query. There are a couple of things to consider regarding how this might be implemented. First and foremost is whether the property is a "virtual" property or a "transformed" property. In my mind, a "virtual" property does not really exist, but is always created by using other properties of the node with, perhaps, external data. In other words, it looks like the "virtual" property exists in the persisted content, but it actually does not. A "transformed" property, on the other hand, probably does exist in the persisted content, but before it is returned it is transiently altered. Theoretically, this transformation might not require any other input, but it also may require external resources and/or other properties on the node. For example, the PropertyFactory approach might work for certain "transformed" properties that require the persisted values and optionally some external resource. However, since the PropertyFactory methods do not know about the node for which the property is being created, the factory could not possibly access other properties of the node, and thus would not work for the "virtual" case. Second, how should the resulting property values be treated within queries and search? Should they be excluded (non-queryable in property definition terms)? If it should be included, then should the underlying value or resulting value be indexed? Third, should be done at the lower-level graph API or within the JCR implementation layer. The graph API is far simpler, and does not address things like versioning. Plus, there really isn't a single concept in the graph API that might work for both "virtual" and "transformed" properties. As a result, my initial thought is that this might be better suited as a formal mechanism within the JCR implementation layer: it's higher-level; a single simple framework can likely handle all variations of "virtual" and "transformed" with a single mechanism; it can take advantage of but is not limited to the graph API (e.g., a custom PropertyFactory); and the result would likely be more straightforward and easier to understand. Thoughts?	1	0	https://issues.jboss.org/browse/MODE-930
15719	MODE-930	I didn't realize that the PropertyFactories don't know about the node for which the property is being created. This indeed defeats the purpose. (1) About the difference between virtual and transformed properties: Do you see implementation differences between the two? To me a virtual property might be the same as a readonly (null) transformed property.But I do think that the property itself should not contain any persisted data as you cannot ask for the 'raw' (untransformed) source. The only way to parameterize (is that english?) the transformation is to set other properties in the repository, possibly from the same parent node.So 'virtual' properties is probably the best name. (2) Considering the previous I suggest that these nodes are not indexed. (3) Looking at the JCR layer, the SessionCache is the best place to hook the property value handling at the JCR level?	0	0	https://issues.jboss.org/browse/MODE-930
15720	MODE-930	Should this be a blocker ?	1	1	https://issues.jboss.org/browse/MODE-930
15721	MODE-930	[~hchiorean], I don't think it should be a blocker. This kind of functionality just isn't defined in JSR-283. As useful as it would be, I think a lot of other features are higher priority. Do you see this as being useful for another required feature?	1	0	https://issues.jboss.org/browse/MODE-930
15722	MODE-916	Is this going to be committed to 2.2.x branch?	0	0	https://issues.jboss.org/browse/MODE-916
15723	MODE-899	Was this rolled back?	1	1	https://issues.jboss.org/browse/MODE-899
15724	MODE-899	Actually, I just saw that this was not made to the 2.2.x branch. Should it?	1	1	https://issues.jboss.org/browse/MODE-899
15725	MODE-888	Noticed IRestClient is deprecated, and from the comment, has been obsolete since 3.1. Should ModeShape Tools 3.3 be written to remove the IRestClient dependency and use its replacement?	1	1	https://issues.jboss.org/browse/MODE-888
15726	MODE-888	In that case is there any point in keeping MODE-1652 open ? Any new "REST client" would basically mean re-creating the module which we're about to delete here....	1	1	https://issues.jboss.org/browse/MODE-888
15727	MODE-887	Given that you can have more than one path for a particular result set if selectors are used, what is the suggested name for the property (or properties) containing the uri(s)? What about mode:uri for the default path and mode:uri-<selector name> if more than one selector was specified?	0	0	https://issues.jboss.org/browse/MODE-887

#	Requirement	Questions	Answered	Successfully Answered	URL
15728	MODE-887	Actually, I've recently seen more examples of using the "link" element in HTML/XML: {code} <link rel="node" href="http://example.com/resources/{repositoryName}/{workspaceName}/item/{path}"/> {code} See http://stackoverflow.com/questions/1271962/creating-hypermedia-links-in-a-custom-media-type and http://www.infoq.com/articles/subbu-allamaraju-rest Now, we're talking about JSON, so we can do something similar on each node, and it could be as simple as: {code} { "node" : "http://example.com/resources/{repositoryName}/{workspaceName}/item/{path}" } {code} That only includes the "view" URL and is implicitly a GET, but we could go so far as to explicitly define the "view", "edit" and "delete" URLs, too. {code} { "link" : [{ "type" : "application/json" "method" : "GET" "rel" : "view" "href" : "http://example.com/resources/{repositoryName}/{workspaceName}/item/{path}" } , { "type" : "application/json" "method" : "POST" "rel" : "edit" "href" : "http://example.com/resources/{repositoryName}/{workspaceName}/item/{path}" } , { "type" : "application/json" "method" : "DELETE" "rel" : "delete" "href" : "http://example.com/resources/{repositoryName}/{workspaceName}/item/{path}" }] } {code} I kinda merged some ideas from http://beautifulbeta.wikidot.com/json-feeds and Rails (see https://github.com/asplake/described_routes) Is that gross?	1	1	https://issues.jboss.org/browse/MODE-887
15729	MODE-887	Okay, regarding your questions: {quote} Given that you can have more than one path for a particular result set if selectors are used, what is the suggested name for the property (or properties) containing the uri(s)? What about mode:uri for the default path and mode:uri-<selector name> if more than one selector was specified? {quote} Yeah, that's interesting. That'd mean that certain columns go to one node, while other columns go to a different node. (There ca be more than just two, also.) I'll have to think about that more.	1	1	https://issues.jboss.org/browse/MODE-887
15730	MODE-881	Randall, can you try running this in your QA/Test environment? Its mostly working but one failed test, which I'm trying to determine is my pc or not.	0	0	https://issues.jboss.org/browse/MODE-881
15731	MODE-861	The patch looks great, although I can conceive of scenarios where this behavior would be seen as an information leak (e.g., if users' home directories were each mapped to a workspace). Could you please add an option that disables this behavior and then default it to false so that this behavior is exposed by default? Thanks!	1	1	https://issues.jboss.org/browse/MODE-861
15732	MODE-860	Wouldn't it be better to have this in the Teiid JOPR plugin, dedicated for finding VDBs that can be deployed? The plugin still could issue the queries using the JCR repository (via the JCR API, without needing any compile-time dependency on ModeShape) or using the RESTful service. Essentially, enter some criteria about the VDB name (wildcard), version (int range), uploaded date (date range), path (wildcard string), and/or description (full-text search or wildcard string), and it could return a table showing: VDB name (ideally hyperlinked), version, description, and path.	1	1	https://issues.jboss.org/browse/MODE-860
15733	MODE-827	I original developed a new JackrabbitXmlNodeTypeSource class that imported the XML content into a transient graph, read that Jackrabbit-oriented graph content and constructed an equivalent ModeShape CND graph structure in another transient graph that was then returned by the JcrNodeTypeSource.getNodeTypes():Graph method. I created several unit tests that used some XML files provided by Jozef, and got everything working. Total time was about 2 hours. But then I started thinking about it, and the inability to easily register node types via the NodeTypeManager has been bothering me for a while. The JcrNodeTypeSource mechanism isn't really very good, because it requires casting to the JcrNodeTypeManager implementation and using a proprietary method. What I've been trying to figure out is whether it's possible to create some loaders that basically created NodeTypeTemplate instances, and then allowed using the standard methods to register those new templates. This afternoon I took the opportunity to create a prototype of a new approach. I created a JcrNodeTypeFactory interface that defines a method to get an array of NodeTypeDefinition instances (remember that the template interfaces are subtypes of the definition interfaces). I then created the CndNodeTypeFactory and JackrabbitXmlNodeTypeFactory implementation classes. Both read their respective formats, and load the content into a graph with ModeShape's CND structure. Because they both operate in a similar way (the only difference is reading the file content and constructing the graph content; but processing the graph content to create the NodeTypeDefinition instances is common, as are a slew of loading methods), I pulled all of that common functionality into a new GraphNodeTypeFactory abstract base class. This new mechanism follows this pattern: CndNodeTypeFactory factory = new CndNodeTypeFactory(session); factory.load(file); // or stream or resource file if (!nodeTypeSource.getProblems().isEmpty()) { // Report problems } else { boolean allowUpdate = false; session.getWorkspace().getNodeTypeManager().registerNodeTypes(factory.getNodeTypes(), allowUpdate); } Note that there are actually a half-dozen "load(...)" methods that handle URLs, resource files, input streams, raw content, and even reading from a graph or subgraph. And the JackrabbitXmlNodeTypeFactory approach is almost identical - other than the class name and not quite as many "load(...)" methods. Yes, this still requires instantiating a ModeShape-specific class, but no other objects need to be cast from the standard JCR API interfaces. So I think this is a little cleaner. The CndNodeTypeFactory and JackrabbitXmlNodeTypeFactory both update the namespaces with those used by the node type definitions within the files, and they even support using different prefixes in the files than what may already be defined in the session. (Of course any new namespace used in the loaded node type definitions will be registered in the workspace using the files' namespace prefixes. And because they're registered with the workspace and not the session, those namespace registrations are available to the rest of the repository users.) Of course, other implementations will need to make sure they're registering new namespaces with the NamespaceRegistry in the session's workspace. Otherwise, the process of registering the node type definitions using the session's node type manager will result in errors due the inability to parse a prefixed name without a namespace registered for that prefix. Incidentally, I did discover a problem with importing XML that contains something like same-name-siblings. The XmlHandler was not keeping track of the SNS indexes when it was building the paths. (This is different than the JCR import, which does work fine.) A few changes to the XmlHandler class and everything works fine. I'm uploading a patch with these changes and asking for feedback on this approach. Is this better, worse, or no different than the older JcrNodeTypeSource approach? Is it worth these changes? (I also didn't want to commit this now, as Brian is working on a fix for MODE-810.)	1	1	https://issues.jboss.org/browse/MODE-827
15734	MODE-827	Guys, could you let me know ASAP (let's say this week) what is your decision regarding subject of this issue? I have to finish the work on Shaped Magnolia, so I need to know how to write (and what MS methods to use in) the ProviderImpl.registerNodeTypes(InputStream) method.	1	1	https://issues.jboss.org/browse/MODE-827

#	Requirement	Questions	Answered	Successfully Answered	URL
15735	MODE-824	I attached a patch (MODE-824_locks.patch) that's a first cut and providing the lock-related functionality in ManagedRepository. The existing ManagedLock class required some fields that were manifestly useful (e.g., expiration date, owning session) that did not exist in the ModeShapeLock class in the JCR layer. Since ModeShapeLock was intended to be valid over a long lifetime and some lock-related fields (e.g., expiration date, owning session) could change constantly and asynchronously, ModeShapeLock only held the immutable fields for the lock. Rather than try to hack these volatile fields into MSL, the patch adds a JcrLockSnapshot class and added a method to RepositoryLockManager to read all locks directly from the graph as a snapshot of the current lock state. Since the ManagedEngine doesn't connect to the repository through a JCR session, it seems essential that the lock snapshots be populated from a direct graph read anyway. Other than needing some Javadoc and a blessing, I am concerned that the patch adds the removeLock(String) method to JcrRepository, but doesn't provide any security checks in that method. Will the ManagedEngine run in some JAAS context that will allow for a security check? For that matter, the JcrRepository.getAllLocks() method also runs without a security check and can leak information (e.g., node UUIDs, user names, workspace names). Am I being paranoid?	0	0	https://issues.jboss.org/browse/MODE-824
15736	MODE-818	Isn't there a workaround for this? I thought the DDL sequencer, when processing this view, will already create a single AST for the whole view (including the definition expression). Is that not the case?	0	0	https://issues.jboss.org/browse/MODE-818
15737	MODE-813	Fantastic! Does this include the WebDAV WAR, too?	1	1	https://issues.jboss.org/browse/MODE-813
15738	MODE-813	Does that mean the user will need to crack open the JAR to modify the users/roles properties? A number of the other components place their users/roles properties files in server/{profile}/conf/props. Not sure if this is standard or convention but it's easier to access/modify.	0	0	https://issues.jboss.org/browse/MODE-813
15739	MODE-813	Can we change the managedConfigRepository.xml to not use the ModeShape URL as the default namespace? I think it's awkward that the repository name is "mode:repository".	1	1	https://issues.jboss.org/browse/MODE-813
15740	MODE-810	The patch was committed, so is there anything left to do on this issue?	1	1	https://issues.jboss.org/browse/MODE-810
15741	MODE-806	I believe the most RESTful style would be to define media types for each query language and each response format. Embedding the query language in the URL does seem easier on the surface (at least when thinking about interacting with it from a browser), but I think that's the wrong approach and doesn't fit in the REST style. I agree with your proposal to return a JSON-encoded representation of the QueryResult, since all of our query languages return that same object (with slightly differing columns for certain languages). Thus we probably need only a single response format MIME type ("application/jcr+query+results" works for me). To be consistent with the rest of the RESTful service's responses, the response format could be JSON with a container for the JSON fragments for each row in the QueryResult (including the URL for the node given by the Row's location). It's also be nice to have the query included. The suggestion to use limits and offsets is a very good one. This can be done with the JCR API without mucking with the query, by using Query.setLimit(long) and Query.setOffset(long). As for the media types for the query languages, I'd suggest something like "application/jcr+sql", "application/jcr+sql2", "application/jcr+xpath", and "application/jcr+search". Then a "doQuery(...)" method for each of these (which probably delegates to a single helper method that accepts the query language as a parameter). Does that work? WDYT?	1	1	https://issues.jboss.org/browse/MODE-806
15742	MODE-806	I briefly looked at the patch, and it looks great. This is fantastic functionality, and has been implemented well. Thanks! Do you have time to update the Reference Guide with the text in the previous comment and an example of a request and a (short) response?	1	1	https://issues.jboss.org/browse/MODE-806
15743	MODE-789	Can Chapter 4 Running the example applications, be renamed to something like: Example Application Setup? since you don't really run it there, and in 4.2 it indicates the next section is where the examples will be run.	1	1	https://issues.jboss.org/browse/MODE-789
15744	MODE-787	JCR-2663 and JCR-2648 are fixed, does it make sense to update these now or wait until all 4 are fixed?	1	0	https://issues.jboss.org/browse/MODE-787
15745	MODE-770	Overall, this is very good. A few comments: 1) The Getting Started guide talks about obtaining the RepositoryFactory instance by simply instantiating the JcrRepositoryFactory. While this is definitely allowed by the JCR 2 specification (and is in fact the minimum required supported behavior), the idiomatic JCR 2 approach seems to be to use the ServiceLocator pattern. And while that pattern does take more code, I think we should use it in the examples. The Reference Guide should probably start out by describing the ServiceLocator approach, but should also document simply instantiating the JcrRepositoryFactory. 2) The JcrRepositoryFactory methods are not all synchronized correctly. The "getRepository(...)" instance method is not synchronized, while the two "shutdown(...)" instance methods are. And the "getEngineFromConfigFile(...)" helper method is static and synchronized, making it synchronized on the class not the instance. Per IRC discussion, the helper method should be made an instance method, and all should be well. 3) I might suggest documenting in JcrRepositoryFactory that it supports the ServiceLocator pattern, including the reference to that class in the "META-INF/services/javax.jcr.RepositoryFactory", plus a simple code example that shows how to use it. (Yes, this is in the Getting Started and Reference Guides, but it's always good to have it in the JavaDoc.) Do these make sense? Should be committable once these are addressed.	1	1	https://issues.jboss.org/browse/MODE-770
15746	MODE-758	A separate RepositorySource implementation in the same project is probably the easiest, since it will have very different JavaBean properties than the existing source class. It might be possible to have a base class do most of the work, and the two subclasses simply define the JavaBean properties and the mechanism for creating the CacheContainer. Does that make sense?	1	1	https://issues.jboss.org/browse/MODE-758
15747	MODE-755	Attached patch that takes a first cut at a path-based repository that works with the new base repository. The patch also ports the FileSystem connector to make sure that the repository works in the "real world". There are still a few todos: 1. Fix the comments - they're all over the map and often wrong 2. Sort out exception handling in the file system connector (see below) 3. Review MapTransaction/PathTransaction to see if they have any common code that can be pushed into BaseTransaction. And some questions: 1. What's the new best practice for throwing exceptions that only occur during the commit? Right now they get swallowed in Connection. 2. Should we keep the prepare/commit framework in place or delete it for now under the principle of YAGNI? Any other feedback would be appreciated as well. Thanks!	0	0	https://issues.jboss.org/browse/MODE-755
15748	MODE-716	Attached a rough patch that implements the RepositoryProvider interface and attempts to lookup a Repositories object at a JNDI name provided through a servlet init parameter. If the object bound to the name is a mere Repository, this provider wraps it in a Repositories object. Is this what you had in mind? This code is completely untested and probably doesn't quite work, but I'd like to get some feedback before I clean it up.	1	0	https://issues.jboss.org/browse/MODE-716

#	Requirement	Questions	Answered	Successfully Answered	URL
15749	MODE-716	What if we reworked my initial patch so that the JNDI name of the repository could be injected more easily? That way, any JCR implementation that supported JNDI binding (which should be all of them, since the JCR TCK test gets its Repository reference through JNDI) could be used with this new RepositoryProvider. If we make the RepositoryFactory JNDI-bindable, then we still need a JndiRepositoryProvider for users who want to share their ModeShape repo across multiple applications. If we made the RepositoryFactory the JNDI binding point, then you might end up with one JNDI binding for the JcrEngine and another for the RepositoryFactory in that model. I may be missing something here though. What do you think about this approach? Sorry for the delay in responding.	1	0	https://issues.jboss.org/browse/MODE-716
15750	MODE-711	I thought this was available in 1.1.0Final as the "cacheConfigurationName" property on the connector as outlined in the reference document. Am I missing something?	0	0	https://issues.jboss.org/browse/MODE-711
15751	MODE-681	Should each type of jdbc driver (i.e., jndi, http, and file) be packaged separately or make one jar?	1	1	https://issues.jboss.org/browse/MODE-681
15752	MODE-681	Well, I take that back. I guess it depends on how big the JAR file is with all of the dependencies, and how that compares to other JDBC drivers. I don't think the JAR file will be too unreasonable, but if it is too big then we could package the JNDI and remote options as one JAR and the local option as another (larger) JAR. WDYT? How big is the all-encompassing JAR?	1	1	https://issues.jboss.org/browse/MODE-681
15753	MODE-681	Yikes. I guess the "file" option is all ModeShape JARs? I can see four options (perhaps there are others): 1) Make a single (monster) JAR. This doesn't seem very attractive for those that want to use the 'jndi' or 'http' mechanisms. 2) Make a single smaller JAR that contains everything needed for the 'jndi' and 'http' mechanisms, but that would not include the rest of the ModeShape JARs. If you want to use the 'file' mechanism, you'd be responsible for ensuring the ModeShape JARs are on the classpath. We could make this a bit easier if we provided a single, all-encompassing JAR for the ModeShape JCR, but at the moment it would entail using the 'modeshape-jcr-with-dependencies.jar' and any of the sequencer and connector '-with-dependency.jar' files needed by the particular config. That's not too bad of a workaround, IMO. A disadvantage of this option is that the driver still accepts the 'file' URLs even though not all classes might be there. 3) Make separate JARs: one for the 'jndi' and 'http' mechanisms, and a monster for the 'file' mechanism. 4) Split the JDBC module into two Maven projects/modules: one for the conventional 'remote' (e.g., 'jndi' and 'http' mechanisms), and a second module that relied upon the first and added the 'file' mechanism. This may not be practical, depending upon how easily it would be to subclass and override/add the file feature. But if it can be easily done, this may be an attractive option. This also makes each module fairly conventional, and the dependencies of each would match what they really are. An advantage of this option compared with option 3 is that this would one different Driver class that would accept the 'jndi' and 'http' URLs, and a different 'embedded' Driver class that would accept 'jndi', 'http', and 'file' URLs. The first is not practical, and IMO option 2 is much better than option 1. Option 3 and 4 are pretty similar, but use a different approach for making the separate JAR. Of 3 and 4, I think I like 4 better. So I think the choice is between 2 and 4. What's the practicality of option 4, given the current JDBC driver design?	1	1	https://issues.jboss.org/browse/MODE-681
15754	MODE-676	Why do you want to remove the "Each time <code>repository(String)</code> is called..." paragraph from the Getting Started guide? That functionality didn't go away. Perhaps the terminology about "load the existing definition" is not quite right? It also may be useful to use the "&version;" entity in place of the "1.0.0.Final" literals. I still think the default mode of the Java source file sequencer should be to produce the new content that matches what the Java class file sequencer produces. If anyone still wants the old format, they can set the "sourceFileRecorderClassName" property accordingly. Otherwise, the suggested changes look great!	1	1	https://issues.jboss.org/browse/MODE-676
15755	MODE-676	> Why do you want to remove the "Each time <code>repository(String)</code> is called..." paragraph from the Getting Started guide? That functionality didn't go away. Perhaps the terminology about "load the existing definition" is not quite right? Yes, but I believe that exact same note is about 3 paragraphs earlier. Apologies if there was a difference that I missed. > It also may be useful to use the "&version;" entity in place of the "1.0.0.Final" literals. That's a good call. Will the &version; entity match the version in Maven? > I still think the default mode of the Java source file sequencer should be to produce the new content that matches what the Java class file sequencer produces. If anyone still wants the old format, they can set the "sourceFileRecorderClassName" property accordingly. I am not comfortable making that call myself. I would not resist it either, although I still would like to hear from Serge on it. I'll get his $0.02 the next time that I see him. > Otherwise, the suggested changes look great! Thanks!	1	1	https://issues.jboss.org/browse/MODE-676
15756	MODE-676	>> Why do you want to remove the "Each time <code>repository(String)</code> is called..." paragraph from the Getting Started guide? >> That functionality didn't go away. Perhaps the terminology about "load the existing definition" is not quite right? > > Yes, but I believe that exact same note is about 3 paragraphs earlier. Apologies if there was a difference that I missed. You're right about the extra paragraph. My bad. >> It also may be useful to use the "&version;" entity in place of the "1.0.0.Final" literals. > >That's a good call. Will the &version; entity match the version in Maven? The "&version;" entity is defined in the "custom.dtd" file (which is not synchronized with Maven), and can simply be used in the DocBook source files.	1	1	https://issues.jboss.org/browse/MODE-676
15757	MODE-653	Well, what would the response be? Would you expect an XSL as well that maybe took the documents and formatted them?	0	0	https://issues.jboss.org/browse/MODE-653
15758	MODE-653	I was thinking more along the lines of a simple interface that would allow you to use a browser to: - see the available repositories (each with a link that does a GET on that repository) - see the available workspaces in a repository (each with a link that does a GET on that workspace, and showing links for the things you can do in that workspace, including browse and search) - browse and navigate (and eventually edit and remove) content under "items", with links for navigation and information about each node - submit queries and see results This is quite simple, and would merely allow more useful interaction with the REST service. WDYT?	1	1	https://issues.jboss.org/browse/MODE-653
15759	MODE-650	Ivan, can you please check the feature of import types from CMIS repository as we discussed and synchronization with bridge implementation regarding nt:file/nt:folder? Thanks!	1	1	https://issues.jboss.org/browse/MODE-650
15760	MODE-650	Oleg, reviewed changes and progress looks very good to me. Here are my findings: - cmis.cnd can be eliminated - CMIS (at least 1.0, I see in trunk they are added some "Item" for 1.1) has notion of "base type id" and "parent type id" for document/folder types definition. In case of mapping, cmis:document will be always base type id for all document types, but parent type id will vary from type to type (see my screenshots). So, when importing children you need to use parent type id to reflect hierarchy - Could you please elaborate about type definition cmis:repository (registerRepositoryInfoType)? What it is used for?	1	1	https://issues.jboss.org/browse/MODE-650
15761	MODE-650	Oleg, I made second patch from 31/Mar/13, could you please take a look?	0	0	https://issues.jboss.org/browse/MODE-650

#	Requirement	Questions	Answered	Successfully Answered	URL
15762	MODE-640	Do you think the factory should be logging AND throwing the exceptions? Seems to me that if it propagates an exception, it should not log it. This is usually a best practice, but this may need to be different because the engine may have multiple problems and because of the way it's part of JNDI and initialization. Thoughts?	1	1	https://issues.jboss.org/browse/MODE-640
15763	MODE-637	"org.modeshape.jboss.managed" (currently no subpackages). I've created a "Managed" object for each managed object listed in this JIRA except for the "Repositories" and "Connectors" groupings. Those will be created by JON/JOPR (per Ted). Each of the "Managed" objects will take a ModeShape delegate object in their constructor. Here is a first draft API for each of those managed objects. I'm still finalizing the method signatures and determining how to implement them. Please notice the "Questions" section for each object. Comments welcome. Thanks. 1. org.modeshape.jboss.managed.ManagedEngine Delegate class: JcrEngine Managed properties: Managed operations: 1. getRepositories() - returns Set<ManagedRepository> 2. getSequencingService() - returns ManagedSequencingService 3. getObservationBus() - returns ManagedObservationBus 4. getConnectors() - returns Set<ManagedConnector> Questions: 1. Is there a way to get the ObservationBus from the engine? 2. Would start() and shutdown() also be good managed operations? 3. Should managed connectors be cached or created each time getConnectors() is called? 4. Should managed repositories be cached or created each time getRepositories() is called? 2. Repositories -> Per Ted, this grouping will be handled by him 3. org.modeshape.jboss.managed.ManagedRepository Delegate class: JcrRepository Managed properties: 1. getQueryActivity() returns ? 2. getSaveActivity() returns ? 3. getSessionActivity() returns ? Managed operations: 1. listLocks() returns ? 2. listSessions(Comparable) returns ? 3. removeLock(Object lockToken) return boolean 4. terminateSession(Object sessionId) return boolean Questions: 1. Should descriptors be readonly managed properties? 2. Should options be readonly managed properties? 4. org.modeshape.jboss.managed.ManagedSequencingService Delegate class: SequencingService Managed properties: 1. getJobActivity() returns ? 2. getQueuedJobCount() return int Managed operations: 1. listQueuedJobs() returns ? Questions: 1. Should the properties of the Statistics be readonly managed properties? 2. Should the state (started, paused, etc.) be a managed operation? 5. org.modeshape.jboss.managed.ManagedObservationBus Delegate class: ObservationBus Managed properties: none identified in JIRA MODE-637 Managed operations: none identified in JIRA MODE-637 Questions: 1. Should hasObservers() be a managed operation? 2. Should shutdown() be a managed operation? 6. Should prestartCoreConnection() be a managed operation? 8. org.modeshape.jboss.managed.ManagedConnector Delegate class: RepositorySource Managed properties: none identified in JIRA MODE-637 Managed operations: none identified in JIRA MODE-637 Questions: 1. Should getName() be a managed readonly property()? 1. Should getRetryLimit() be a managed operation? 2. Should setRetryLimit() be a good managed operation? 3. Should close() be a managed operation? 4. Should the RepositorySourceCapabilities	1	1	https://issues.jboss.org/browse/MODE-637
15764	MODE-637	What you describe sounds fantastic, and it's exactly along the lines of what I was hoping for. I'll try to answer your questions below (hopefully my organization will make sense): 1.1 Right now the ObservationBus is not exposed (better to not expose it until it's needed), so we'll have to add a way to get at it. We'll have to think about whether we want to expose public methods on JcrEngine, or perhaps have JcrEngine expose a "monitoring" object that has the accessor methods. (The latter option might simply make it more obvious that it's not for general use.) See also my answer for 5.1 1.2 "Start" and "Shutdown" might be good operations, as might a "Restart" (that shutsdown and starts the engine). 1.3 Offhand, the ManagedEngine should maybe just create new ManagedConnection objects each time, and should not hold onto them. That makes things much easier all around (no synchronization of the list of ManagedConnection, no removal, etc.), and I think this will work whether or not JOPR holds on to the managed objects. (If JOPR asks every time it needs them, then fine. But if JOPR caches the results, then those should be valid as long as JOPR "knows" when it should throw out its cached objects and refetch.) 1.4 Same as 1.3, but applied to ManagedRepository 3.1, 3.2, 3.3 (properties) These methods will all return an int, where the unit is something along the lines of "Sessions per minute". (Ted and I discussed other possible metrics, but they were always "instantaneous" values like "Open Sessions" that could very likely be not representative of other instants in time.) For now, the ManagedRepository will just have to fake up values. 3.1 (operations) listSessions will return an immutable list of (immutable) objects that each represent a session and that has the session's workspace name (String), username (String), internal session ID (string), and perhaps the time (DateTime) the session was created. This list of objects should be created each time the method is called. 3.2 (operations) listLocks will return an immutable list of immutable objects that each represent a lock in the repository and has the following fields: workspace name (String), session-based (boolean), locking session ID (string), lock expiration (DateTime), lock UUID (String), lock owner (String), deep (boolean). The actual locks are stored as nodes under "/jcr:system/mode:locks", so it should be pretty easy to read that information. 3.3 (operations) perfect. 3.4 (operations) perfect. 3.1, 3.2 (questions) Yes, descriptors and options should be read-only. Right now, changing an option requires restarting the engine. (Yeah, that's not ideal, but it's what it is at the moment. Until we get requests to make the options modifiable, we'll very likely leave it as it is.) 4.1 (properties) Job activity is an int (just like Session Activity). 4.2 (properties) Job queue is really just the list of runnables in the ExecutorService. We'll have to decide how to change this so we have the list of Futures. 4.1 (operations) We'll need an object that represents the Future. 4.1 (questions) yes, immutable 4.2 (questions) No need to manage the state at this time. 5.x Maybe it's not appropriate to expose the ObservationBus at this time. I think we should be very explicit about what we expose, and should not just expose something because it's there, and it sounds like maybe there's not much value in exposing it anyway. 7.1-7.4, 7.6-7.9 Shouldn't these just be managed properties? 7.5, 7.10-7.12 I don't think these need to be managed operations, since I'm not sure it makes sense to do these things to the pool (e.g., shutdown) without shutting down the engine. 8.1 Yes, getName() should be a read-only property 8.2 RetryLimit could be a writable property, couldn't it? 8.3 No, close() should not be a managed operation. (Doing that would make it unusable by the engine.) 8.4 Yes, these all can be managed, read-only properties. The remainder of the RepositorySource's bean properties can be writable properties. 8.5 Yes, ping() should be the only managed operation. What do you think?	1	1	https://issues.jboss.org/browse/MODE-637

15766	MODE-637	Wanted to post an update to what I have done so far: - I've done a lot of work on the annotations for managed objects, properties, and operations. Still don't understand fully all what is required. - I've implemented all the methods not mentioned below. - I've stubbed in some dummy data for most things. So these managed classes can be used now before actually getting a real ModeShape engine. Here is the work left to do: - check-in existing code (waiting for 1.2 release first) - complete annotations (need to get help here) - Connection Pool 1. implement flush() returns boolean 2. how do you calculate connections destroyed count? 3. how do you calculate in-use high water mark? 4. how do you implement getMinSize() - Connector 1. need to find out how to reflectively add managed properties - Engine 1. how do you lookup engine in JNDI? - Repository 1. implement getQueryActivity() returns int 2. implement getSaveActivity() returns int 3. implement getSessionActivity() returns int 4. implement listLocks() returns List<ManagedLock> 5. implement listSessions() returns List<ManagedSession> 6. implement removeLock(String lockId) returns boolean 7. implement terminateSession(String sessionId) returns boolean - Sequencing Service 1. implement getJobActivity() returns int 2. implement getQueuedJobCount() returns int 3. should getStartTime() return a string-ified date instead of long? 4. implement listQueuedJobs returns Collection<ManagedFuture> 5. implement ManagedFuture Answers to above questions and help on how to implement the above methods is appreciated. Thanks!	0	0	https://issues.jboss.org/browse/MODE-637
15767	MODE-637	These new operations probably need to be on a managed repository, and we'll have to include the workspace name in the input. Having said that, do we have a way of viewing the available workspace names for a repository? If not, we may want to add that ability.	1	1	https://issues.jboss.org/browse/MODE-637
15768	MODE-637	Do we need a list of sequencers to display in JON/Jopr?	1	1	https://issues.jboss.org/browse/MODE-637
15769	MODE-637	We don't really need a list of sequencers, but we may want to provide a way to see the sequencer configurations. Each configuration defines a classname, classpath (tho that will be unused in our JBoss installation), and path expression [1]. Is there a way in JOPR to easily add these configurations, perhaps where the classname is really a choice list of named sequencers (and we specify the classname in the managed objects) and editable path expression strings? [1] http://docs.jboss.org/modeshape/latest/manuals/reference/html_single/reference-guide-en.html#path-expressions	1	1	https://issues.jboss.org/browse/MODE-637
15770	MODE-637	Randall... "Is there a way in JOPR to easily add these configurations, perhaps where the classname is really a choice list of named sequencers (and we specify the classname in the managed objects) and editable path expression strings? " By editable path expression strings, do you mean that is something you would like to persist for a sequencer? If we have a way to get all names sequencers and their properties, we can display them as a separate resource or maybe on the engine configuration page.	1	1	https://issues.jboss.org/browse/MODE-637
15771	MODE-612	The approach looks great. One question: it looks like in the SessionCache.JcrNodeOperations that the "compute(...)" implementation initializes the version history for the supplied node, but that in the Graph.save() method (where an anonymous class is used to call the "compute(...)" method) is done once for each child. Is this right? Won't this be expensive for large numbers of children (even when the parent and/or children are not versionable)?	1	1	https://issues.jboss.org/browse/MODE-612
15772	MODE-611	I'm willing to provide an implementation. to be honest, I think the current one should be renamed "connector-hibernate" would a target for the older JPA 1 or the newer JPA 2 be desired? I see some level of desire to expose criteria queries, and based on what I see you doing in the current connector, JPA 2 does automatically (deleting orphan children, for example)	0	0	https://issues.jboss.org/browse/MODE-611

#	Requirement	Questions	Answered	Successfully Answered	URL
15773	MODE-611	The MODE-1209 patch will switch us to doing just that (q.v., https://github.com/bcarothers/modeshape/commit/2505083f0e3a053b456c7889bb08ca5d092ce857#L4R1276). Hopefully, that will get committed to trunk today. We still have a lot of legacy settings on JpaSource itself though that map to implementation-specific functionality rather than parts of the JPA standard. For example, setting connection pool sizes, transaction isolation levels, etc. You could argue (correctly) that all of this can be set in persistence.xml, but if we only supported that method, we'd have a pretty big break in backwards compatibility. Also, it seems wrong not to be able to override some common settings at that level. I suppose that we _could_ add a GenericJpaAdapter that ignores all of the source settings (and adds warnings to that effect), allowing users to use any JPA implementation and control everything through the persistence.xml if they so chose. WDYT?	1	1	https://issues.jboss.org/browse/MODE-611
15774	MODE-580	We already have acquired all the resources for the new name: - we have a Magnolia project for the ModeShape JBoss.org site (http://www.jboss.org/modeshape), though it's not yet active as I haven't published it yet - we own the 'modeshape.org' domain is ours, and http://www.modeshape.org will soon redirect to http://www.jboss.org/modeshape, and we'll be able to use 'org.modeshape' for our package names. - we have a new JIRA, and I will be moving all of the DNA issues into the ModeShape JIRA. Our issues will be of the form "MODE-XYZ" plus a new SVN repository, new mailing lists, new blog site, new Twitter account, and new Ohloh project. - we have a new logo design and should soon have the images we need Here are the first steps: 1) The JBoss DNA SVN has already been locked down, and no more changes can be made to it. DONE! 2) All of the history from the DNA SVN has already been loaded into the ModeShape SVN. Basically, it looks exactly like the DNA repository did right after the 0.7 release. But at the moment, it is locked down as well, pending the next step. DONE! 3) I will move all DNA JIRAs (all of them, including those that are complete or incomplete) to the ModeShape JIRA. Any links to DNA issues will automatically redirect to the corresponding issue in the ModeShape JIRA. The numbers won't match, but JIRA has it's own way of doing things. 4) I've started renaming the projects, packages and classes. The projects will go from 'dna-...' to 'modeshape-...", and our package structure will go from "org.jboss.dna..." to "org.modeshape...". And any class that has "DNA" in the name will be renamed. I will then commit these changes to the ModeShape SVN. I will also move all of the JIRA issues from DNA to 5) I will then open up the ModeShape SVN, and you could switch your development environments over to use https://svn.jboss.org/repos/modeshape/trunk . But at this point, we still only want to change JavaDoc, comments, and the documents. After this is done, we'll release ModeShape 1.0.0.Beta1, which will essentially be the same thing as DNA 0.7 except with the new brand, new module names, and updated documentation. We'll publish the http://jboss.org/modeshape project, and we'll start publicizing everywhere we can. And, the code in SVN will be changed to be 1.0.0.GA-SNAPSHOT, and we can continue fixing issues, completing any part of the rebranding, and working towards 100% TCK runs and 1.0.0.GA! What can you do now? - Sign up for the new mailing lists at https://lists.jboss.org/mailman/listinfo/. As usual, we have modeshape-announce@..., modeshape-commits@..., modeshape-dev@..., modeshape-issues@..., and modeshape-users@.... - If you're on Twitter, follow @modeshape and retweet when the time comes - If you use an RSS reader, add our new blog at http://modeshape.wordpress.com/. No need to do anything if you're already subscribed to the JBoss Feed. - If you have any local changes, create some patches and edit them so that they'll work with the new project names and package structure - Go to the new IRC room, #modeshape on freenode.net - Relax for a few days while I do my magic with JIRA and SVN	1	1	https://issues.jboss.org/browse/MODE-580
15775	MODE-536	Serge, Is there a reason you suggested http://www.jboss.org/dna/downloads/eclipse-update-sites.html ? When we changed over to the new project site, the downloads were moved to http://downloads.jboss.org/jbossdna/ (for example http://downloads.jboss.org/jbossdna/0.6/jboss-dna-0.6-gettingstarted-examples.zip). JBoss.org automatically provides download metrics for artifacts on http://downloads.jboss.org, so it'd be useful to have the actual update site be at http://downloads.jboss.org/jbossdna/updatesite/<versionOrLatest>. Note that the last URL would have a readable HTML page that should point to the installation instructions (something akin to http://www.jboss.org/tools/download/update.html). This is the same pattern that JBoss Tools uses: a page at http://www.jboss.org/tools/download.html that describes the different update sites that are actually available at URLs like http://download.jboss.org/jbosstools/updates/stable/	0	0	https://issues.jboss.org/browse/MODE-536
15776	MODE-465	Has any work begun on this or is it still in the planning stage ?	1	1	https://issues.jboss.org/browse/MODE-465

#	Requirement	Questions	Answered	Successfully Answered	URL
15777	MODE-465	Actually, the work is pretty far along, and I'm actively working on it (now that 0.6 is out the door). I'm actually working on a (local) branch, and am hoping to commit what I have to trunk relatively soon. The design is based on the approach that JCR 2.0 has taken: multiple query languages are parsed into a single Abstract Syntax Tree (a "query model"), which is then executed by single engine. This means that 'dna-graph' will have a QueryEngine component parses string queries (given the name of the language, and a registered parser for that language that transforms the string query into an AST representation), plans and optimizes the query, constructs a processing plan, and delegates to a 'QueryProcessor' component to execute the processing plan and generate the results. These results are then returned to the caller of the QueryEngine. This design allows us to do a couple of different things. First, we can create multiple language parsers, yet have one engine. Second, the planning and optimization components can either be customized or replaced, so the whole query engine framework can be reused. Third, the query engine is completely independent of the execution, though the capabilities of the QueryProcessor can be taken into account during planning/optimization. We're actually providing a QueryProceessor implementation that uses Lucene indexes, and with this a way to populate the Lucene indexes by scanning the graph content and/or updating the indexes based upon events. We'll actually plug this query engine into the DNA JCR system in a couple of ways. Each connector will optionally be able to support querying its content (either by pushing down the queries to the underlying system, or by having a Lucene index and just instantiating the query engine within the connector). The federation connector will support queries by pushing down queries to the connectors being federated, and it will be able to manage a Lucene index for each connector that doesn't support queries. Then, since the JCR implementation will basically just implemented on top of the federated connector, it just has to delegate the queries down to the federated connector. Currently the following components are pretty complete (and have a lot of unit tests, though the tests are probably not sufficient): the QueryEngine, the AST classes, the query planner, the rule-based optimizer, and the QueryProcessor framework. The Lucene-based QueryProcessor implementation is at least 50% done and what remains is mostly integration. I'll be done with the JCR SQL2 parser (actually, the parser is complete and I have many unit tests, but only 50% of the parser is tested) in another day or so. What's left is: - commit the current state (I've been waiting to make sure all the pieces look like they'll fit together, and I'm probably no more than a few days away) - write an XPath parser - start integration testing of the query engine with the Lucene-based processor - add query support to the connector API - change some of our connectors to support queries (mostly just integrating the query engine and Lucene processor), though the federation connector will require some extra customization - add support for text extraction - expose through our JCR implementation - make sure the events work and are wired correctly, as well as set up mechanisms to manage the scanning and re-indexing of all content Another approach is to not yet put add query support to the connector API, but instead to just have our JCR implementation own the QueryEngine and Lucene-based processor. I'm not sure if this will save much time or effort (mostly because of federation), but it is an option. This is still a fair amount of work, but as you can see I think this design will be pretty powerful and will allow the connectors to really control how they handle queries. When it's committed to trunk, we'll be able to divvy up the tasks. WDYT so far? Yeah, this is a really rough description, but I do hope to document this more and blog about some of the details.	0	0	https://issues.jboss.org/browse/MODE-465
15778	MODE-455	a good approach - it provides master persisted lock information accessible to all distributed processes. The organization seems pretty good - /jcr:system/dna:locks/<lock_for_node_given_node_uuid>, where the lock node contains the information about the node being locked as well as the information about the owner of the lock. And the restriction to mix:referenceable nodes is obvious, since the nodes' UUIDs are used in the name of the DNA lock. Considering that this approach doesn't work with nodes that are not mix:referenceable, would it work to use the UUID for the lock (rather than the UUID of the locked node) as the node name? The UUID and/or path could then be kept in the lock info node (and because this node is locked, only the session with the lock token can modify the node and possibly move the node, and in that case the session could update the path in the lock info). This would make it more difficult to quickly look up a lock given a node, but isn't that the point of the in-memory map? The in-memory map could be changed to be keyed by Location, which would work by path and/or UUID and/or by other ID properties. I'm not sure whether this would even work, because I might be missing some aspects of the current design or failing to recognize all of the issues with this alternative. Thoughts? Back to the current patch. Here are a few comments: In WorkspaceLockManager: 1) As the patch defines the code, the DnaLock.isLive() method is getting backdoor access to the map outside of a lock scope, and this seems like an error. 2) I'm not sure whether the read-write lock is guarding only the in-memory map or also the persisted content. If it's the latter, then what about other sessions created in other processes? If the read-write lock is to guard only the in-memory map, then the map probably can be changed to be a concurrent map and the read-write lock removed entirely, which could very well have a significant performance impact since this method is called once for each node in the path of a node that is being modified. Also, is the map just providing an in-memory cache of the content in the repository? 3) The lock tokens appear to just be the string form of the locked node UUID. This is pretty easily forged, correct? Not sure that this is a bad thing, but it does give users a bit more rope to hang themselves. 4) The lockFor(UUID) method could be changed to accept an AbstractJcrNode, and thus would encapsulate a bit more of the WorkspaceLockManager internals. Of course, the lockFor(String token) would need to be changed a bit to reflect how the lockFor(UUID) worked. The rest of my comments are _very_ minor nits. In AbstractJcrNode: 1) lock() will be called a lot (for every modification method on any node or property) ... seems like it'd be useful to cache some of the references. Also (minor nit) seems like the code could be cleaned up to reduce duplication by using a do-while loop. In JcrRepository: 1) JcrRepository.login(...) calls JcrRepository.getLockManager() and passes the WorkspaceLockManager reference into the JcrWorkspace constructor. This additional constructor parameter really isn't necessary, since the JcrWorkspace constructor could get it's own WorkspaceLockManager from the JcrRepository that is passed as a parameter to the constructor. 2) Some of the use of the concurrent lockManagers map is not really correct. Basically, one should never do multiple checks within a single method, since the map can change from one map method to the next. So, for example: WorkspaceLockManager getLockManager(String workspaceName) { WorkspaceLockManager lockManager = lockManagers.get(workspaceName); if (lockManager != null) return lockManager; lockManagers.putIfAbsent(workspaceName, new WorkspaceLockManager(executionContext, this, workspaceName, locksPath)); return lockManagers.get(workspaceName); } should really be: WorkspaceLockManager getLockManager(String workspaceName) { // Check for an existing lock manager ... WorkspaceLockManager lockManager = lockManagers.get(workspaceName); if (lockManager != null) return lockManager; // Need to create one if one hasn't just been created ... lockManager = new WorkspaceLockManager(executionContext, this, workspaceName, locksPath); WorkspaceLockManager	1	1	https://issues.jboss.org/browse/MODE-455

#	Requirement	Questions	Answered	Successfully Answered	URL
15779	MODE-455	to the map outside of a lock scope, and this seems like an error. FIXED - switched to use of ConcurrentHashMap and removed the lock 2) I'm not sure whether the read-write lock is guarding only the in-memory map or also the persisted content. If it's the latter, then what about other sessions created in other processes? If the read-write lock is to guard only the in-memory map, then the map probably can be changed to be a concurrent map and the read-write lock removed entirely, which could very well have a significant performance impact since this method is called once for each node in the path of a node that is being modified. Also, is the map just providing an in-memory cache of the content in the repository? FIXED - Switched DnaLock to ThreadSafe (since it has no mutable internal state but does rely on the thread-safe workspace locks map), moved workspaceLocks to be a ConcurrentHashMap and deleted the manual locking 3) The lock tokens appear to just be the string form of the locked node UUID. This is pretty easily forged, correct? Not sure that this is a bad thing, but it does give users a bit more rope to hang themselves. FIXED - The lock tokens are now UUIDs themselves that are independent of the underlying node's UUID. 4) The lockFor(UUID) method could be changed to accept an AbstractJcrNode, and thus would encapsulate a bit more of the WorkspaceLockManager internals. Of course, the lockFor(String token) would need to be changed a bit to reflect how the lockFor(UUID) worked. NOT FIXED - There's a place where I need to walk up the graph from the current node to the root to make sure that none of the parents have a deep lock. I can get the underlying o.j.d.g.Node easier than the AbstractJcrNode. If I changed to using AbstractJcrNode as the argument, I'd have to do more materialization (albeit with the same number of data retrieves). I'm still open to changing this, but it doesn't seem worth the materialization penalty to me off the cuff. The rest of my comments are _very_ minor nits. In AbstractJcrNode: 1) lock() will be called a lot (for every modification method on any node or property) ... seems like it'd be useful to cache some of the references. Also (minor nit) seems like the code could be cleaned up to reduce duplication by using a do-while loop. NOT FIXED - I don't think that you can do any non-trivial lock caching (i.e., cache the results of lockFor(nodeUuid)) since that could be changed outside of the current session. I did cache the workspace().session().lockManager() calls. I think I see what you're saying about refactoring into a do-while, but the lock handling is different for a lock on the current node vs. one of its parents if lockIsDeep is false. I think it's slightly more efficient as is, but I may be missing something. In JcrRepository: 1) JcrRepository.login(...) calls JcrRepository.getLockManager() and passes the WorkspaceLockManager reference into the JcrWorkspace constructor. This additional constructor parameter really isn't necessary, since the JcrWorkspace constructor could get it's own WorkspaceLockManager from the JcrRepository that is passed as a parameter to the constructor. FIXED - Good point. The redundant constructor arg is no more. 2) Some of the use of the concurrent lockManagers map is not really correct. Basically, one should never do multiple checks within a single method, since the map can change from one map method to the next. So, for example: WorkspaceLockManager getLockManager(String workspaceName) { WorkspaceLockManager lockManager = lockManagers.get(workspaceName); if (lockManager != null) return lockManager; lockManagers.putIfAbsent(workspaceName, new WorkspaceLockManager(executionContext, this, workspaceName, locksPath)); return lockManagers.get(workspaceName); } should really be: WorkspaceLockManager getLockManager(String workspaceName) { // Check for an existing lock manager ... WorkspaceLockManager lockManager = lockManagers.get(workspaceName); if (lockManager != null) return lockManager; // Need to create one if one hasn't just been created ... lockManager = new WorkspaceLockManager(executionContext, this, workspaceName, locksPath); WorkspaceLockManager newLockManager = lockManagers.putIfAbsent(workspaceName, lockManager); if (newLockManager != null) { // Some other thread just added this lock	1	1	https://issues.jboss.org/browse/MODE-455
15780	MODE-455	I definitely like the changes to the graph layer, including the changes to the fluent graph API as well as the requests. It may be good to elaborate a bit in the JavaDoc for the connector capabilities and what 'supports locking' actually means. I think it's intuitive that if a connector "supports locking", it basically allows locks to be used on (at least some of) its content, and will either confirm or veto a lock requests. But it may be a bit more ambiguous as to what it means to not support locking. I'd guess this means that the connector is saying that locks will not be permitted on any of its content, and that if any lock requests do come down, they will be vetoed/rejected. Is this correct? And what will the behavior of our existing connectors be? IMO, the JPA, in-memory, JBoss Cache, and Infinispan connectors should certainly support locking, but since they are really "storage" connectors (meaning that the underlying systems are 'owned' by DNA and are being accessed by DNA) they have no need to do anything special with the lock requests, other than approve them. On the other hand, the file system connector should _not_ support locking (perhaps this can change when Java 7 enables interaction with native FS locks). And the SVN connector is read-only right now and thus should also not support locks, though when the connector is changed to support writes, the connector could also be changed to support locking by integrating with native SVN locks. Does this sound right? Probably should update the Reference Guide, too.	1	1	https://issues.jboss.org/browse/MODE-455
15781	MODE-454	Below are the TCK tests that are failing using my (not currently checked-in) implementation of the ObservationManager and why I think they are failing. One design note: I had to implement a check that makes sure Changes with a timestamp before the time a listener was registered do not get delivered to that listener. This was a problem because the events were created and the listener was being registered in one thread and the event notification was being handled in a different thread. I will write Jiras for (1) requests don't differentiate between setting a new property or changing an existing property, and (2) Changes need to include a session identifier so that the ObservationManager can handle the "noLocal" flag. ========== LockingTest testAddLockToNode - no PROPERTY_ADDED events received testRemoveLockFromNode - no PROPERTY_REMOVED events received NodeRemovedTest testMultiNodesRemoved - no NODE_REMOVED event for child nodes when a parent is removed NodeMovedTest testMoveWithRemove - fails with NPE (originalParent) in GraphSession.containsChangesWithExternalDependencies() NodeReorderTest testNodeReorder - no events received (need to research what happens when node.orderBefore(sourcePath, destinationPath) is called) PropertyAddedTest testSinglePropertyAdded - no events received since PROPERTY_ADDED changes are implemented as PROPERTY_CHANGED events testMultiPropertyAdded - no events received since PROPERTY_ADDED changes are implemented as PROPERTY_CHANGED events PropertyChangedTest testSinglePropertyChangedWithAdded - too many events as PROPERTY_ADDED changes are being broadcast as PROPERTY_CHANGED events AddEventListenerTest testNodeType - path is /testroot/node2/node3 but should be /testroot/node1/node3 (need to research this one) testPath - should not have path /testroot/node1 (so does isDeep mean not to include parent path?) testIsDeepFalseNodeAdded - path is /testroot/node1 and should be /testroot/node1/node2 (expected test results seems wrong??) testIsDeepFalsePropertyAdded - no events since PROPERTY_ADDED changes are sent as PROPERTY_CHANGED events testNoLocalTrue - still have to implement "noLocal" check in ObservationManager testUUID - no events received since no PROPERTY_ADDED changes are implemented as PROPERTY_CHANGED events WorkspaceOperationTest testCopy - no NODE_ADDED event generated for child node of copied parent node	1	1	https://issues.jboss.org/browse/MODE-454

#	Requirement	Questions	Answered	Successfully Answered	URL
15782	MODE-445	Overall, I think it turned out very nice. I only checked it closely in the JCR module (which led to me attaching this patch to hide three version-related classes), but it seemed to show about what I would have expected. On a related note, should we hide the JcrI18n class? I can't see anyone needing to access that directly from their application. I did get a three test failures when I ran "mvn -P assembly clean install" from modeshape-source (instead of modeshape-jcr). They all looked something like this: java.lang.AssertionError: Expected: is "JBoss, a division of Red Hat" got: "${project.parent.organization.name}" at org.junit.Assert.assertThat(Assert.java:502) at org.junit.Assert.assertThat(Assert.java:492) at org.modeshape.jcr.JcrRepositoryTest.testDescriptorValues(JcrRepositoryTest.java:484) at org.modeshape.jcr.JcrRepositoryTest.shouldProvideBuiltInDescriptorsWhenNotSuppliedDescriptors(JcrRepositoryTest.java:195) at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method) at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:39) at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:25) at java.lang.reflect.Method.invoke(Method.java:597) at org.junit.internal.runners.TestMethod.invoke(TestMethod.java:59) at org.junit.internal.runners.MethodRoadie.runTestMethod(MethodRoadie.java:98) at org.junit.internal.runners.MethodRoadie$2.run(MethodRoadie.java:79) at org.junit.internal.runners.MethodRoadie.runBeforesThenTestThenAfters(MethodRoadie.java:87) at org.junit.internal.runners.MethodRoadie.runTest(MethodRoadie.java:77) at org.junit.internal.runners.MethodRoadie.run(MethodRoadie.java:42) at org.junit.internal.runners.JUnit4ClassRunner.invokeTestMethod(JUnit4ClassRunner.java:88) at org.junit.internal.runners.JUnit4ClassRunner.runMethods(JUnit4ClassRunner.java:51) at org.junit.internal.runners.JUnit4ClassRunner$1.run(JUnit4ClassRunner.java:44) at org.junit.internal.runners.ClassRoadie.runUnprotected(ClassRoadie.java:27) at org.junit.internal.runners.ClassRoadie.runProtected(ClassRoadie.java:37) at org.junit.internal.runners.JUnit4ClassRunner.run(JUnit4ClassRunner.java:42) at org.apache.maven.surefire.junit4.JUnit4TestSet.execute(JUnit4TestSet.java:62) at org.apache.maven.surefire.suite.AbstractDirectoryTestSuite.executeTestSet(AbstractDirectoryTestSuite.java:140) at org.apache.maven.surefire.suite.AbstractDirectoryTestSuite.execute(AbstractDirectoryTestSuite.java:127) at org.apache.maven.surefire.Surefire.run(Surefire.java:177) at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method) at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:39) at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:25) at java.lang.reflect.Method.invoke(Method.java:597) at org.apache.maven.surefire.booter.SurefireBooter.runSuitesInProcess(SurefireBooter.java:345) at org.apache.maven.surefire.booter.SurefireBooter.main(SurefireBooter.java:1009)	1	1	https://issues.jboss.org/browse/MODE-445
15783	MODE-445	What is 'modeshape-source' ? This error typically occurs when the property files are not properly filtered before copying to the target/ folder.	1	1	https://issues.jboss.org/browse/MODE-445
15784	MODE-402	Can we agree on the limitation that all properties so defined must come before any child nodes?	1	1	https://issues.jboss.org/browse/MODE-402
15785	MODE-402	Brian, did you mean to say "there doesn't seem a way to add a property VALUE ..." ? The current graph API does allow you to set a property on a node, even if that node was created in a previous request (even if they're in the same batch). For example, I can create a node (maybe supplying a handful of properties), and then call setProperty(x).on(samePath) and that will work just fine. In fact, if setProperty is called right after the create, then the set property request even get merged into create request. The graph API currently doesn't allow adding a value to a property; this is the heart of DNA-379. The importer should already be keeping track of the path given the current stack, and you should always be able to set a property on the node (even after any child elements have just been finished). The only tricky part is that to handle multi-valued properties (i.e., where each value is represented by a different child element's content), then the importer might have to keep a map of the properties set via child elements (and overwrite them if additional child elements are read with additional values for a property), and set them only when the element is ended. If I'm correct, then it shouldn't matter whether the property child elements come before child elements, or in what order the property child elements appear. It just means that the importer has to maintain a stack of properties for each "incomplete node" (or do this on the existing stack). Waiting for DNA-379 would allow this to work without having to maintain the properties in the stack, since the processing of each child node (with content) would mean just adding that value to the property with the given name. I agree it would be easier. The only question is whether it's worth doing DNA-379 in 0.4.	1	1	https://issues.jboss.org/browse/MODE-402
15786	MODE-381	Applied both patches. The first hides the "dna:nodeDefinition" property from the JCR layer (meaning it might exist in the graph layer, but won't appear as properties of JCR nodes). The second patch adds to "nt:base" a property definition for a "dna:nodeDefinition" property that is protected and not mandatory (nor autocreated). The spec is not clear as to whether a JCR implementation can add properties to "nt:base" (the required supertype of all node types), the spec is clear that an implementation can add properties to any of the built-in node types through mixins. Therefore, the second patch actually adds this new definition to "nt:base" by having "nt:base" extend the new "dna:defined" mixin, which has the new "dna:nodeDefinition" property definition. Because the "dna:nodeDefinition" is protected, JCR clients will not be allowed to define another property with this name, nor will they be able to set the property (using a residual definition) to any value. All this validation is done through the normal process, requiring no code specific to "dna:nodeDefinition". Nicely done! This is a great demonstration on how node types, node definitions, and property definitions can be used to enforce a structure while having no additional validation code.	0	0	https://issues.jboss.org/browse/MODE-381

15787	MODE-363	I like the approach of using templates (ala 283). Is there a way to change the NodeTypeSource-approach to use the new registration mechanism? Seems like that might clean up things quite a bit. I also do like where you are going with refactoring of findPropertyDefinition to use Predicates. However, I'm not convinced it's better. One goal I had with the old design was that the logic was very obvious and "in your face" (not masked by a lot of method calls), and I deemed this as more beneficial than the ugliness of the duplication. So while the new approach gets rid of the duplication, it doesn't really keep the "in your face" logic. Plus, the new approach doesn't reduce the number of lines (385 new vs 373 old). Besides, I'd prefer for this change to be pulled out into a different patch (or even a different issue). Also, considering the size of the change to support registration and unregistration, would it be better to not address thread-safety in the same patch? Also, although using a thread-safe container would be beneficial, we made need to use an explicit ReadWriteLock if the thread-safe container doesn't offer the required level of atomicity. Requiring users to oder the types to be registered is a perfectly valid assumption, I think. At least for now, since it'd likely keep the implementation much more simplistic. One thing we're going to have to address is that we can't update existing JcrNodeType objects. So, if a supertype is changed (re-registered), we really need to rebuild all of the node types that extend it. Unfortunately this is the only way to truly have immutable objects.	1	1	https://issues.jboss.org/browse/MODE-363
15788	MODE-310	We need to use only SVN-compatible patches so that any users (including those without Eclipse workspaces) can apply the patches. (Although Eclipse can produce standard patch files for a project, it creates Eclipse-specific files when creating a patch from changes to multiple projects.) Creating patches is very easy. Let's assume we want to create a patch to capture local changes made against the latest revision of "trunk". Simply go to the "trunk" folder in your local working area, and issue this command: svn diff . > ~/DNA-000.patch where "DNA-000" represents the JIRA issue number that describes the changes (and where the patch will be uploaded). Note that the destination in the command creates the patch file in your home directory, but you could place it anywhere. Also note that 'diff' ignores binary files, so any binary files need to be uploaded separately (http://www.igorexchange.com/node/89#creating_patches) Now, someone else wants to apply the patch, so they download the patch file and apply the differences using the 'patch' utility: patch -p0 < ~/DNA-000.patch The "-p0" option makes sure that all files can be found.	0	0	https://issues.jboss.org/browse/MODE-310
15789	MODE-293	From Sergiy: My thoughts that we would want to anticipate wide range of customer's different deployment scenarios with minimum efforts, right? This is especially true with SOA-Platform and JBoss Enterprise Data Services Platform which includes JBoss ESB, JBoss jBPM, JBoss Rules and JBoss Enterprise Application Platform (JEE App server). So in addition to Embedded and MicroRepository we would certainly need "Enterprise" Repository that may be deployed as EAR into any JEE compatible server, and may be accessble through RMI in addition to HTTP, HTTP+REST, etc. IMO, we would still need to develop few "reference deployment packages" and I can participate in these efforts. Even more, we can integrate Jackrabbit transparently into web/app server - thanks to JackRabbit has JCA connector and JNDI, so DNA clients (REST API, web UI) will think they talking to JBoss DNA JCR. Jackrabbit also allows loading previously exported XML content into JCR repository - so we can test DNA predefined graph structure. That will also help with integrated and functional testing of our stack without waiting for DNA JCR implementation. For instance, REST API and web applications will require at least basic functional testing - I was thinking about using SOAP UI to test WS services and REST API. WAR packaging scenarios aree OK, but if you have multiple session facades (your business logic) plus multiple web apps (e.g. REST API, web admin UI based on Flex, web app based on RichFaces, web app based on XXX, etc) + shared code - the right approach would be to use EAR that was designed for that purpose and stores multiple WAR files, shared libs, session facade EJB3 artifacts all together. Actually this resembles MVC paradigm, right? Plus, remember that EBJ3 artifacts are just POJO with annotations - so that makes them simple and thin while benefiting from standard services like resource pooling, thread management, security and transaction propagations, JMX, etc. Same Stateless Session Bean could be accessed locally, remotely through RMI, and as WebService with absolutely no extra effors needed. On the other hand, JEE App servers getting smaller, becoming embedded like JBoss Embedded and small like Glassfish embedded. It's no longer monolithic 100Mb thing - we can prepare deployment with just few megs. Not to mention that nextJEE6 is talking about different profiles to support more lightweight scenarios. From Randall: I completely agree that DNA will can anticipate many different scenarios. But I also am concerned about over-engineering and adding complexity or intent where we don't need it yet. From Sergiy: What's the DNA overall deployment strategy? I've mentioned it here https://www.jboss.org/community/docs/DOC-12952 From Randall: There will be several. One is an embedded case, where an application wants to use a local repository and will access it through the JCR API. This repository may be federated from multiple sources, including the file system, and may use sequencers, allowing the application to have a repository with a mixture of the content it wants. A variation of this is the MicroRepository. This is also embedded, but uses just a few of the DNA artifacts plus very minimal dependencies. The idea is that an application could use the repository as the bootstrapping mechanism. Think of an OSGi repository, or Maven repository, or JBoss Microcontainer. Another case will be a shared resource, much like a database. I foresee this being most easily deployed as a .war file, or actually a choice of .war files that range from a simple RESTful service on top of multiple repositories, to including other web services and web applications). This is probably closest to your architectural diagram, but I'm not sure I know exactly what kind of technologies will be used - I presume we'll try to pick the best tools for the job, once we know more about the requirements. Also, I don't want to go too far with this, as there are plans within JBoss to use DNA inside the SOA-Platform and JBoss Enterprise Data Services Platform. It may be that the open-source DNA remains mostly a set of artifacts and maybe some tools, leaving the more "integrated stacks" of technologies for products (from JBoss and others).	1	1	https://issues.jboss.org/browse/MODE-293
15790	MODE-277	Isn't this a dupe of MODE-41?	1	0	https://issues.jboss.org/browse/MODE-277
15791	MODE-273	Wouldn't it be just as useful to sequence all of the content, and allow the user of the resulting information decide whether only the first line is used? One benefit is that a CSV importer in Tool X might be able to show the user some of the data, helping the user know whether particular columns are of interest.	1	1	https://issues.jboss.org/browse/MODE-273
15792	MODE-273	Would it be best to sequence the entire file (which could easily contain multiple megabytes of data) or just a sample (perhaps the first N rows)?	1	1	https://issues.jboss.org/browse/MODE-273
15793	MODE-266	Does the latest patch add enum and annotation support for the source version, too? That's awesome. Should we make the two sequencers produce the same content (by default)? And should we do that for 1.0? That seems to be a good thing to bring them together.	1	1	https://issues.jboss.org/browse/MODE-266

#	Requirement	Questions	Answered	Successfully Answered	URL
15794	MODE-235	databases as part of single server instance, Oracle uses single database but multiple schemas. We may review how database access tools like Aqua Data Studio (based on Java Swing and JDBC) intepreting such graphs. I'm talking about the root part of such graph - from root node to let's say table node. > For example: > <root database node>/<sub graph that difficult to map in generic way>/tables/... > <root database node>/<sub graph that difficult to map in generic way>/views/... > <root database node>/<sub graph that difficult to map in generic way>/users/... > > We need to think more how we will map subgraph highlighted above onto different db vendors concepts: > MS SQL/Sybase, etc: > <root database node>/databases/<db name>/user tables/<user name>.<table name> > <root database node>/databases/<db name>/system tables/sys.<table name> > <root database node>/databases/<db name>/views/<view name> > > > Oracle and others similar: > <root database node>/schema/<user name>/tables/<table name> > <root database node>/schema/<user name>/views/<view name> > > We may consider merging both styles together or having them separate (both approaches have advantages and disadvantages). I would prefer > generic, merged concept view - for benefits of DNA-JCR and REST toghether so clients don't have to change graph based on particular vendor. From Randall: Do we really think it's our job to come up with a single model? Why can't we simply expose what the database exposes? Like you said, it's mostly at the high-level (what I'd call the organizational level, above the tables/views/procedures/etc.). How about taking it one step at a time, and focusing on getting the functionality there to expose the same organizational structure that the database uses. At some point, we'll probably want to come up with a single approach, but even then I think we'd want to make it optional (specified in the metadata connector). I also think that we should use mixins for the type information (or maybe even node types that are extensible to allow any properties), and that means we could actually not have any nodes that exist to collect the types. This is much more along the lines of a So, Oracle's schema might show up as content: <db:schema jcr:name="Products"> <db:table jcr:name="PRODUCTS"> <db:column jcr:name="ID" ... /> <db:column jcr:name="NAME" ... /> ... <db:primaryKey ... /> ... </db:table> <db:table jcr:name="TABLES" jcr:mixins="db:system" ...> ... </db:table> <db:view ...> ... </db:view> <db:procedure> ... </db:procedure> </db:schema> I've shown that any system table/view/procedure could have an additional "System" mixin. The great thing about this approach (of using mixins rather than names in a hierarchy) is that you can more readily build queries to get the content in any structure you want. I've used an XML notation; for details about this notation, see the note somewhere after paragraph 5 in http://www.jboss.org/file-access/default/members/dna/freezone/docs/0.3/manuals/reference/html/repositories.html#dna-connector-federation. From Sergiy: > Anyway, for both styles we may add generic metadata subnode about RDBMS capabilities (that will hold all not specific to database object propertise like supportsMixedCaseIdentifiers(), storesUpperCaseIdentifiers(), supportsAlterTableWithAddColumn(), etc): > > <root database node>/capabilities From Randall: Yup. <db:capabilities supportsMixedCaseIdentifiers="true" db:supportsUpperCaseIdentifiers="true" ... /> From Sergiy: Sub nodes of table, view, etc nodes are pretty easy to model because they are similir for many databases. I was thinking about something similar to following (I guess we may have design sessions and may refactor it later): .../tables/<table name>/data [default primary type, so it can be omitted] table's data records .../tables/<table name>/data/record 1 .../tables/<table name>/data/record N From Randall: Let's table the data discussion for the moment. I've got very different ideas about how that will work, since this is too flat for tables with millions of rows. We may want to do something like this for a sampling of the data (something that's very useful when you're dealing with metadata, but even then there are enterprise security issues with this). From Sergiy: .../tables/<table name>/columns/<column name> .../tables/<table name>/constraints/<constraint name>	1	1	https://issues.jboss.org/browse/MODE-235
15795	MODE-235	I think we have a couple of choices when it comes to designing the hierarchy for database metadata. 1) Do not use node types at all, but instead use some other mechanism (e.g., hierarchy with predefined names to connote the types of content under it). This would be a difficult approach, as it relies too much on convention and is not flexible (e.g., what happens when a node has multiple types). It also is neglecting several of the primary features of JCR. 2) Use node types, where the node type is used to identify the "primary type" of the node. JCR only allows one primary type, and it is a constant for the lifetime of the node. Other aspects can be captured as mixins and/or property values. The node types and mixins would define the properties and children that are allowed. 3) Use a generic node type (e.g., "nt:unstructured") and do all the interesting things with mixins. Since the node type really allows anything, it doesn't matter that it is constant throughout the node's lifetime. Mixins describing the various facets ("system-ness", "table-ness", "view-ness", "schema-ness" etc.) could be added an removed at will. So if we rule out #1, then the choice is between #2 and #3. Normally, I'd be in favor of #3, but database metadata is fairly structured, and it's usually not important to change from one type to another. The node type could also restrict the types and number of children. Therefore, #2 seems like a better approach to me.	1	1	https://issues.jboss.org/browse/MODE-235

#	Requirement	Questions	Answered	Successfully Answered	URL
15796	MODE-233	the children of a node ... Children children1 = graph.get().children().at(path); Children children2 = graph.get().children().of(path); Children children3 = graph.get().children().of(path).matching(nameMatcher); Children children4 = graph.get().children().matching(nameMatcher).of(path); Children children5 = graph.get().children().having(propertyMatcher).of(path); // Get the values of a single property by iterating ... for (Object value : graph.get().property(name).at(path)) { } for (Object value : graph.get().property(name).on(path)) { } for (Object value : graph.get().property(name).of(path)) { } // Get the properties on a node by iterating ... for (Property property : graph.get().properties().at(path)) { } for (Property property : graph.get().properties().at(path).matching(nameMatcher)) { } for (Property property : graph.get().properties().at(path).matching(nameMatcher)) { } // Get a node (both properties and children) ... Node node1 = graph.get().node().at(path); Node node2 = graph.get().node().with(uuid); Node node3 = graph.get().node().having(uuid); Node node4 = graph.get().node().at(uuid); Node node5 = graph.get().node(path); Node node6 = graph.get().node(uuid); // Work with the properties and children of a previously obtained node... Children children6 = node1.getChildren(); Children children7 = node1.getChildren().having(propertyMatcher); Children children8 = node1.getChildren().matching(nameMatcher); Property prop7 = node1.getProperty(name); MultipleProperties props4 = node1.getProperties(); MultipleProperties props5 = node1.getProperties().having(propertyMatcher); MultipleProperties props6 = node1.getProperties().matching(nameMatcher); // Get a subgraph (nodes and properties) Subgraph subgraph1 = graph.get().subgraph("/a/b"); Subgraph subgraph2 = graph.get().subgraph("/a/b").ofDepth(3); Subgraph subgraph3 = graph.get().subgraph().at("/a/b").ofDepth(3); Subgraph subgraph4 = graph.get().subgraph().at(uuid).ofDepth(3); // Get nodes from within a subgraph ... Node node10 = subgraph1.getRoot(); Node node11 = subgraph1.getNode(relativePath); Node node12 = subgraph1.getNode(uuid); // We can add support for visitors, too // graph.get().subgraph(path).visit(myVisitor); // Then there are operations on a graph that result in changes to the graph. These consist of // copy, delete, move, create, and set. When using these, the graph records the commands but // delays executing (or committing) them against the source until the "commit()" method is called. // // Changes to the graph can be interspersed with "get()" commands. When this happens, it is // up to the graph implementation to define the behavior when the result of a get command // is requested (e.g., the get command is to be executed) while there are uncommitted changes. // Copy a portion of the content in the graph ... graph.copy().node("/a/b/").into("/x/y"); graph.copy().node("/a/b/").into("/x/y").and().get().node("/m/n"); graph.copyNode("/a/b/").into("/x/y"); graph.copy().node().at("/a/b").into("/x/y"); graph.copy().node().with(uuid).into("/x/y"); graph.copy().subgraph("/a/b").into("/x/y"); graph.copy().subgraph().at(uuid).into("/x/y"); graph.copySubgraph("/a/b/").into("/x/y"); graph.copy().children().of(uuid).into("/x/y"); graph.copy().children().matching(nameMatcher).on(uuid).into("/x/y"); graph.copy().children().of(uuid).matching(nameMatcher).into("/x/y"); graph.copy().children().of("/a/b").into("/x/y"); graph.copy().properties().of("/a/b").into("/x/y"); graph.move().node("/a/b/").into("/x/y"); graph.move().node("/a/b/").into("/x/y").and().get().node("/m/n"); graph.move().node().at("/a/b").into("/x/y"); graph.move().node().with(uuid).into("/x/y"); graph.move().properties().of("/a/b").into("/x/y"); graph.move().properties().of("/a/b").matching(nameMatcher).into("/x/y"); graph.move().children().of("/a/b").into("/x/y"); graph.move().children().of(uuid).into("/x/y"); graph.move().children().with(nameMatcher).on(uuid).into("/x/y"); graph.move().children().having(propertyMatcher).on(uuid).into("/x/y"); graph.move().children().matching(nameMatcher).on(uuid).into("/x/y");	0	0	https://issues.jboss.org/browse/MODE-233
15797	MODE-140	Renamed the "getEnvironment()" methods to "getExecutionContext()" to reflect the previous change in name of the ExecutionContext (was ExecutionEnvironment). Also renamed the "getProperties()" method of some of the SPI graph commands that returned an Iterator<Property> to now be "getPropertyIterator()", which is now consistent with the other graph commands. Made FederatedNode a concrete class (not an interface), moved it, and implemented additional interfaces so that it can be treated as a GetNodeCommand. Finally, made more changes to the FederationCommandExecutor implementation.	0	0	https://issues.jboss.org/browse/MODE-140
15798	MODE-138	The federation system will use JAAS to do authentication. This was implemented in the FederatedRepositorySource by making use of the ExecutionContextFactory.create(...) methods that will use JAAS LoginContext instances to authenticate the subject. Once an ExecutionContext (was called ExecutionEnvironment) is obtained by the FederatedRepositorySource, it uses that context to talk to the configuration repository and to create the FederatedRepository instance.	0	0	https://issues.jboss.org/browse/MODE-138
15799	MODE-53	The most obvious first approach for a URI design is to directly represent each node in the repository as a resource, and to map the repository operations to GET (read), PUT (update/create), POST (create), and DELETE (delete). For example, "/a/b/c/d" would identify the node "/a/b/c/d". A "GET /a/b/c/d" request would obtain a representation of the "/a/b/c/d" node. Perhaps the first challenge to this approach is whether to also treat properties as resources. If each property were treated as a resource, then the URI design would have to distinguish a node property named the same as a that of a child of the same node. For example, if a node /a/b/c in the previous example contained a child "d" and a property "d", then is "/a/b/c/d" referring to the node or the property? One option is to distinguish properties with a character ('@' comes to mind), although which character would depend on URL escaping requirements. It probably is possible to require this character only when there is a child with the same name as a property name (something that is not too frequent, I expect). The kind of resource to return (e.g., JSON, XML, HTML, etc.) should be driven by the "accept" HTTP header, which specifies the media ranges (mime types with optional parameters) that are being requested. Multiple mime types can be specified, with precedence rules and quality factor denoting the preferred order. See http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html By using the HTTP header, the URI no longer needs to deal with extensions or any other mechanism to denote the desired response format. And this means that the URI design can more closely match the resource names. Here's an example of a GET request to obtain a JSON representation of node "/a/b/c/d": GET /a/b/c/d Host: myhost.example.com Accept: application/json URI query parameters are useful to supply additional criteria and information about the representation to be returned, such as depth of the representation or reading just the properties or children. This seems to be an acceptable way of affecting the representation. What about operations, like move or copy? One choice is to use query parameters (e.g., PUT with a "?moveTo=/a/b/e" or POST with a "?copyOf=/a/b/e"). Another option would be to allow actions or operations in the representation that is PUT by the client. The following example is an HTTP request to move node "/a/b/c/d" to "/a/b/e" and simultaneously set the "jcr:title" property to "This is a new title": PUT /a/b/c/d Host: host.example.com Accept: application/json Content-Length: nnn Content-Type: application/json { "dna-action:moveTo": "/a/b/e" "jcr:title" : "This is the new title" }	1	1	https://issues.jboss.org/browse/MODE-53

#	Requirement	Questions	Answered	Successfully Answered	URL
15800	MODE-53	The URI design may need to make room for different repositories, workspaces, etc. The first segment of the URI (below the host or application URI) might specify the repository name, the second the workspace name, followed by the path to the node. For example: /repoA/myWorkspace/a/b/c/d would identify the node "/a/b/c/d" in the "myWorkspace" workspace of the "repoA" repository configured by the RESTful server. What about searching? Well, search could be done using the "/search" URI, making that a reserved name and unusable for the repository name in the configuration. That probably is pretty acceptable. What about a web application for users to view, navigate, edit the content through a browser? Well, its quite likely that this application would be in a different WAR (perhaps still deployed to the same server). However, there are two options if the web app is to be in the same WAR file: reserve the "/ui" URI for this (might be a good idea anyway), or simply use the HTTP accept header to specify that a client wants the (probably rich) HTML for a resource.	1	1	https://issues.jboss.org/browse/MODE-53
15801	MODE-48	There is some overlap between the JCR 1.0 and 2.0 API, but we may need separate API implementations (depending upon whether 2.0 is a superset of 1.0).	0	0	https://issues.jboss.org/browse/MODE-48
15802	MODE-34	Can this be done through URLs, or does this need access to the file system to get directory listings?	1	1	https://issues.jboss.org/browse/MODE-34
15803	MODE-34	Should this use WebDAV?	1	1	https://issues.jboss.org/browse/MODE-34
15804	MODE-31	the sequencer was whether the UUIDs used within the model files should be used as the "jcr:uuid" property value on the corresponding nodes. If we did do this, then resolution would be really easy, as model references could be mapped directly into JCR (weak) references, and JCR would magically do the dereferencing for us. But JCR (and ModeShape) uses "jcr:uuid" as a primary key, so there can be only one node with a particular UUID in a workspace. That means that if we went this route, we'd only be able to have one copy (or version) of a model in the repository at a time. This is the same constraint as we had with MMR and DTC, and IIRC there were quite a few cases where that proved to be a major limitation. So if we want to be able to upload a model any number of times into the repository (e.g., the model by itself and any VDBs containing a model), we need a different approach. If we instead capture the 'mmuuid' values as separate properties, then we can still have properties that use these XMI UUIDs as indirect references. This will require using JCR-SQL to resolve references (to the possibly multiple nodes, if there are multiple versions of a model in the repository), though when we do know a single node to which the reference resolves where the references resolve, we can actually cache/record this as a JCR weak reference property. In fact, a simple pattern of four properties allows us to capture the raw information (e.g., hrefs or mmuuids) and have slots to capture the resolved information (e.g., the names and weak references) if known. I've defined a simple naming convention for these properties. If the reference is single valued: {referenceName}Href - stores the href literal value from the XMI file {referenceName}XmiUuid - stores the XMI UUID to the referenced node, if the href had an embedded UUID (hrefs to data types and XSD components don't use UUIDs) {referenceName}Name - stores the name of the resolved node {referenceName} - stores the JCR weak reference to the resolve node If the reference has an upper bound greater than 1 (e.g., it is multi-valued), then the properties are slightly different: - {singularReferenceName}Hrefs - stores the href literal values from the XMI file - {singularReferenceName}XmiUuids - stores the XMI UUIDs to the referenced nodes, if the hrefs had embedded UUIDs (hrefs to data types and XSD components don't use UUIDs) - {singularReferenceName}Names - stores the names of the resolved nodes - {pluralReferenceName} - stores the JCR weak references to the resolve nodes References to model objects within the same model are easily resolved upon sequencing, and so we set all of the properties. However, references to objects in other models cannot be resolved at sequencing time (though I'm trying to make it so that sequencing a VDB causes the references within the VDB's models to all be resolved). Because we need the ability to upload a model into a repository more than once, the current sequencer uses the more complicated multi-property pattern. However, it'd be pretty easy to add another sequencer that uses the XMI UUIDs as the JCR UUIDs, but I'll wait on that since we wouldn't use that in production anyway. === Node Types === The sequencer follows JCR best-practices by defining all nodes to have a primary type of "nt:unstructured", meaning it's possible and valid for any node to have any property (with single or multiple values). However, it is still useful to capture the metadata about what that node represents, and so we use mixins to do this. For example, we have a "xmi:referenceable" mixin with a single "xmi:uuid" property, and that is patterned after the built-in "mix:referenceable" mixin. Since all model objects have mmuuids, all nodes will have this mixin. I've written a utility that reads in an ECore metamodel file and writes out a rough CND file containing a mixin node type for each metaclass, where that mixin contains a property definition for each metaclass attribute and a child node definition for each metaclass containment relationship. Each non-containment relationships are represented using the four-property pattern mentioned above. These automatically-generated CND files were then hand-modified to be slightly more usable. === Default Values === As you know, default values are not written by EMF into the XMI model files, so the sequencer has nothing to read in. Luckily, JCR has a way to deal with this. Because we're defining mixin node types	0	0	https://issues.jboss.org/browse/MODE-31
15805	MODE-28	Problem I see with sequencers is that they don't get anything close to a filename so guessing mimetype based on file extension is quite hard. That leads to other problems as without file extension, all e.g. OpenOffice documents are application/zip, all source files all text/plain, etc. Is there any other way how to get the currently sequenced node reference to search for other info?	1	0	https://issues.jboss.org/browse/MODE-28
15806	MODETOOLS-79	Did you want the choices to only be (1) include project - which is the current way, or (2) not include project? Or also maybe a (3) exclude project and enter a new root path? For instance, if there is an Eclipse project called "Test" with these files: /Test/a.txt /Test/b.txt /Test/folder/c.txt And a ModeShape publish area called "/files." The results would be: For (1) above (current way): /files/Test/a.txt /files/Test/b.txt /files/Test/folder/c.txt For (2) above: /files/a.txt /files/b.txt /files/folder/c.txt For (3) above with new path called "mypath": /files/mypath/a.txt /files/mypath/b.txt /files/mypath/folder/c.txt	1	1	https://issues.jboss.org/browse/MODETOOLS-79
15807	MODETOOLS-79	[~elvisisking]: do you think either (2) or (3) would require significant effort ? Based on this we'll have to see whether this can be included in the upcoming DV ER(s) or not.	1	1	https://issues.jboss.org/browse/MODETOOLS-79
15808	MODETOOLS-54	I created a new CND with a node type and property and there was no MS header. Is this the scenario? Could you have had some file template auto-inserted maybe?	1	0	https://issues.jboss.org/browse/MODETOOLS-54
15809	MODETOOLS-8	Randall, I was leaving that open until I resolved the update-site URL issue we discussed. This morning I talked to Mickael Istria about how we could change where the Jenkins job puts the update-site. Currently the job puts it here: /downloads_htdocs/modeshape/builds/staging/modeshape-tools-continuous/all/repo You mentioned you didn't like that path. What do you want that update-site URL for this job to look like? Mickael said I need to create a Jira and assign to Nick Boldt with the new path. Let me know the path you would like and I will write issue and get with Nick. Thanks!	0	0	https://issues.jboss.org/browse/MODETOOLS-8

#	Requirement	Questions	Answered	Successfully Answered	URL
15810	MODETOOLS-8	Although we're setting the location, isn't the rest of that path defined by the script? If so, I'd guess there were a reason JBT used "staging" and "all/repo". Perhaps that's because their release process involves copying/moving the code over? That's been my assumption: that the JBT folks had reasons for doing that. What happens after we have an update site for say 3.0 but then want to release 3.1? Shouldn't it get added into the existing update site somehow? If not and our job should just publish in the correct location, then we certainly can change do that (it does make things easier). Pulling this completely out of thin air, my initial guess might be these paths for our actual update sites: {{/downloads_htdocs/modeshape/tools/update/}}_{{\{stable|develop\}}}_{{/}}_{{\{helios|indigo|juno|etc\}}}_ This assumes that each build works with a single Eclipse platform version, and we therefore need to break out the Eclipse platform version in our URL structure. (I don't know when/if we'll start building for multiple platforms, but we should account for that possibility.) WDYT? We could possibly do without the "{{update}}" segment, but I'm not sure it's that big a deal to leave it and may even be useful to help users recognize it as an update site URL.	0	0	https://issues.jboss.org/browse/MODETOOLS-8
15811	MSC-125	Is it not just a matter of appending a list representation of the cycle array to the message?	1	1	https://issues.jboss.org/browse/MSC-125
15812	MSC-84	Can you be more specific? The API already allows for reporting of failure causes for services.	0	0	https://issues.jboss.org/browse/MSC-84
15813	NTA-94	Amos, You can make a start with the current docs. Currently it only deploys to a specific commit of WildFly (see docs). Can you figure out why it doesn't deploy to WildFly master and fix the issue? When I update the docs to show how to run the tool, you can check that that works on WildFly master.	0	0	https://issues.jboss.org/browse/NTA-94
15814	NTA-22	Why does the demo scenario create "two additional transactions"? I'd only expect to see one JTA transaction.	1	1	https://issues.jboss.org/browse/NTA-22
15815	NTA-10	Amos, Can you take a look at our other PR jobs and see if you can make one for NTA?	1	1	https://issues.jboss.org/browse/NTA-10
15816	NETTY-452	@Trustin: I just pulled it to master and 3.2. Can you close it?	1	0	https://issues.jboss.org/browse/NETTY-452
15817	NETTY-450	When implementing page/action cache in my web framework, I wanted to use HttpMethod as one of the elements of cache key. It's convenient if HttpMethod were serializable. But it's OK now. I don't want HttpMethod to be serializable any more. Thanks for your work with Netty.	0	0	https://issues.jboss.org/browse/NETTY-450
15818	NETTY-413	I would agree but the issue is: what is a message then ? What I mean is to count Written or Read Messages, you have to know how are those messages. For instance, take an HTTP answer, you can first try to write a first series of bytes with only the header, then make a second write with the body. Is it 2 messages or 1 ? Functionnaly it is 1, but technically, you made 2 writes... So my guess is that it could be difficult to have such counters in a standard way, even if I perfectly agree with you of the interest. So do you have any idea ?	1	0	https://issues.jboss.org/browse/NETTY-413
15819	NETTY-345	HttpChunkAggregator could merge the trailing headers into the aggregated HttpMessage. Would it be enough?	1	1	https://issues.jboss.org/browse/NETTY-345
15820	NETTY-336	Trustin, will this also deal with the problem in JBPAPP-6092 ? The problem there is that we run multiple Netty transports in a single JVM and the tread delimiter is static, so you can't have a prefix per transport there, because the thread delimiter class will be the one associated with the last transport started, in this case the Memcached one. I can't find a workaround for this either because when a thread is created, all I know is whether is a worker/master or whether it's a client or server one however, I have no extra information available to me. The thread naming delimiter should be a factor of the NettyChannelPipelineFactory or the ServerBootstrap, rather than being static.	1	1	https://issues.jboss.org/browse/NETTY-336
15821	NETTY-336	Is this still planned to be released?	0	0	https://issues.jboss.org/browse/NETTY-336
15822	NETTY-333	Hi Trustin.. the above branch already supports file upload. That's what i figured looking at the example for http server isn't it?	0	0	https://issues.jboss.org/browse/NETTY-333
15823	NETTY-333	Kevin, could you elaborate with me on if how it's different from Frederic's implementation? Maybe I am missing something.	1	0	https://issues.jboss.org/browse/NETTY-333
15824	NETTY-311	Not needed anymore.. IpFilter will do.	0	0	https://issues.jboss.org/browse/NETTY-311
15825	NETTY-307	@Trustin: Do you have any preferences if this should only get added to master ? I think we could add it to 3.2 branch too, as it is an isolated feature and so a "non risk" change.. WDYT?	1	1	https://issues.jboss.org/browse/NETTY-307
15826	NETTY-307	My guess is that there might be some duplication in Daniel's and Norman's work. Perhaps we should join the force and reduce any possible duplication? Norman, could you take a look into Daniel's pull request and see what we can do if you have some free time? Cheers, Trustin	1	0	https://issues.jboss.org/browse/NETTY-307
15827	NETTY-297	Hi Steven, I could make the framing code more strict to address this issue since the current implementation checks only the length field. Do you have an example packet that triggers this issue?	1	1	https://issues.jboss.org/browse/NETTY-297
15828	NETTY-257	This is a nasty issue.. and seems to boil down to the fact that CharsetEncoder and CharsetDecoder cannot compute the needed length for a given sequence of bytes, and thus it gets quite hard to know if the given operations will succeed (from the users perspective). If its to be implemented anyways then I suggest the following signatures: // Use this to copy into an existing array, returns number of chars written in dst public int getChars(int index, int length, char[] dst, int dstIndex, int dstMaxLength, String charsetName); // Use this to decode into a new array of needed size. CharsetEncoder and CharsetDecoder can produce this for you. public char[] getChars(int index, int length, String charsetName); // Write a number of chars to the ChannelBuffer, returns number of bytes written public int writeChars(int index, char[] from, int fromIndex, int fromLength, String charsetName); Regarding optimizations, then you could either create charset specific versions of these methods, ie. getASCIIChars, writeCharsInASCII. Or you could switch on the charset internally in each method. Decoding and encoding UTF-16 is quite easy to do naively. Same with US-ASCII except it can produce encoding errors. Im not sure its a good idea to handle anything else oneself unless its a strict subset of UTF-16.	1	0	https://issues.jboss.org/browse/NETTY-257

#	Requirement	Questions	Answered	Successfully Answered	URL
15829	NETTY-257	Perhaps the following might be enough? // Useful for reading fixed length strings // Returns the number of written chars int getString(int index, int length, char[] dst, Charset charset); int getString(int index, int length, char[] dst, int dstOffset, Charset charset); int getString(int index, int length, Appendable dst, Charset charset); // Useful for reading nul-terminated strings // Returns a status object that tells the number of read bytes and written chars (see below) DecodeResult getString(int index, int length, char[] dst, Charset charset, ChannelBufferIndexFinder terminatorFinder); DecodeResult getString(int index, int length, char[] dst, int dstOffset, Charset charset, ChannelBufferIndexFinder terminatorFinder); DecodeResult getString(int index, int length, Appendable dst, Charset charset, ChannelBufferIndexFinder terminatorFinder); + equivalent readString() methods (no need to specify index, readerIndex advances) // Returns the number of written bytes int setString(int index, char[] src, Charset charset); int setString(int index, char[] src, int srcOffset, int srcLength, Charset charset); int setString(int index, CharSequence src, Charset charset); int setString(int index, CharSequence src, int srcOffset, int srcLength, Charset charser); + equivalent writeString() methods (no need to specify index, writerIndex advances) final class DecodeResult { final int readBytes; final int writtenChars; } In case of overflow, IndexOutOfBoundsException could be raised. To get the safe number of required chars / bytes, you could use the following idiom: CharsetDecoder d = ...; int requiredChars = (int) ((double) numberOfBytesToDecode * d.maxCharsPerByte())); or CharsetEncoder e = ...; int requiredBytes = (int) ((double) numberOfCharsToEncode * e.maxBytesPerChar())); What do you think?	1	1	https://issues.jboss.org/browse/NETTY-257
15830	NETTY-257	Is the lack of EncoderResult on purpose? Im not sure its bad to support Appendable. You could always instanceof the dst and cast it to a CharBuffer to avoid making a copy. I guess the same could be done with the CharSequence from setString(). I guess thats it. It looks good to me.. except maybe a utility method that produces a String/char[] without giving a dst.	1	0	https://issues.jboss.org/browse/NETTY-257
15831	NETTY-257	Im not really sure what I was thinking about the EncoderResult.. About Appendable. What I tried to explain was that you could just allocate a new CharBuffer to decode into and then pass that to the Appendable instance. However, if the given Appendable is an instance of CharBuffer then just cast and pass that to the CharsetDecoder. Its a couple of days since I looked at it but Im pretty sure the append, and put methods on CharBuffer have the same behaviour so it should be sound to do. Does it make sense?	1	0	https://issues.jboss.org/browse/NETTY-257
15832	NETTY-257	That's a great idea (Appendable). Here's the revised signatures with much less number of methods: int getString(int index, int length, Appendable dst, Charset charset); DecodeResult getString(int index, int maxLength, Appendable dst, Charset charset, byte terminator); DecodeResult getString(int index, int maxLength, Appendable dst, Charset charset, ChannelBufferIndexFinder terminatorFinder); int readString(int length, Appendable dst, Charset charset); DecodeResult readString(int maxLength, Appendable dst, Charset charset, byte terminator); DecodeResult readString(int maxLength, Appendable dst, Charset charset, ChannelBufferIndexFinder terminatorFinder); int setString(int index, CharSequence src, Charset charset); int setString(int index, CharSequence src, int srcOffset, int srcLength, Charset charset); int setString(int index, Readable src, Charset charset); int writeString(CharSequence src, Charset charset); int writeString(CharSequence src, int srcOffset, int srcLength, Charset charset); int writeString(Readable src, Charset charset); final class DecodeResult { final int readBytes; final int writtenChars; } Internally, CharBuffer could be determined using the instanceof operator because CharBuffer implements both Readable and Appendable. However, I'm not really sure if the getters with ChannelBufferIndexFinder are really needed. Most encoded strings are terminated by one byte (e.g. NUL) except for UTF-16. I'd like to remove them if there is a common use case for using ChannelBufferIndexFinder to find a string terminator.	0	0	https://issues.jboss.org/browse/NETTY-257
15833	NETTY-246	I still think HTTP proxy connectivity should be separated into a new transport. For example: ClientSocketChannelFactory f = new HttpProxyClientSocketChannelFactory(new HttpTunnelClientChannelFactory(new NioClientSocketChannelFactory(...))); Is there any reason that the tunneling transport and the proxy connectivity should be combined into one transport?	1	1	https://issues.jboss.org/browse/NETTY-246
15834	NETTY-246	I've checked in a few small changes mostly related with code cleanup: * tabs -> spaces * private fields accessed by inner classes -> changed the access modifier to package-private * set missing svn:eol-style and svn:keywords properties - perhaps the autoprops configuration was not working when you were adding the files? I also added a couple 'FIXME' markers to source code regarding the unused variables. Could you take a look? Now I will replace java.util.logging with Netty's logging layer, which is also trivial. :)	1	1	https://issues.jboss.org/browse/NETTY-246
15835	NETTY-246	Sure. I do agree with your idea to improve the logging API. We could take care of the logging API problem as a separate issue. By the way, the log messages at WARN / ERROR level could be converted to the 'exceptionCaught' events because it is unusual to see such cases. What do you think?	1	1	https://issues.jboss.org/browse/NETTY-246
15836	NETTY-246	The cases where I can see things being logged at the WARNING level all relate to when an unknown message is received. This is likely to happen if a browser attempts to talk to the tunnel server, or if the client attempts to establish a tunnel with a normal web server that does not understand the request. It may be justified to throw exceptions up the pipeline if this occurs, but I don't know which exception. Is there a good, generic "connection failed" exception that's worth raising, that we could subclass to highlight the specifics? Some comments regarding the FIXME's you have added: HttpTunnelAcceptedChannelFactory - you have a FIXME here stating that the methods should not be exposed to users. The interface itself is default protected, so the interface will not be usable outwith the org.jboss.netty.channel.socket.httptunnel package. So, users cannot use these methods. Also, methods on interfaces are always public, whether you specify as such or not. The only thing you can do to narrow their availability is to change the interface to default protection instead of public. HttpTunnelClientWorkerOwner - similarly, this interface is not useable outwith the httptunnel package, so the FIXME seems invalid. HttpTunnelClientChannel - I agree with the FIXME in onBindRequest(). Perhaps we could bind the send channel to the specified SocketChannel, and bind the poll channel to an ephemeral port on the same interface?	1	1	https://issues.jboss.org/browse/NETTY-246
15837	NETTY-246	Rescheduling to ALPHA3 since ALPHA2 is supposed to be released today. Iain, could you let me know the progress of this issue? I didn't see check-ins recently. If you don't mind, I can fix them by myself. If you have local modifications, I'd suggest you to check in more often. Thanks!	1	1	https://issues.jboss.org/browse/NETTY-246
15838	NETTY-246	I notice that, when using OIO, proxy settings set by system properties will be applied automatically on the Socket used by Netty (new Socket() then uses sun's SocksSocketImpl that has built in support for HTTP and SOCKS proxies...). This is not the case when using NIO, however, whereas we need explicit support for HTTP and SOCKS put into Netty... Am I right?	1	1	https://issues.jboss.org/browse/NETTY-246
15839	NETTY-242	Hello, did you have the time to take a look at this contribution ? -- ron	1	0	https://issues.jboss.org/browse/NETTY-242

#	Requirement	Questions	Answered	Successfully Answered	URL
15840	NETTY-239	Does HttpRequest.getUri() return different values for the same HTTP request? HttpRequest.getUri() always return the second component of the request line in verbatim. For example, getUri() always returns '/jaxws-endpoint/endpoint/number1?wdsl' for the following request: GET /jaxws-endpoint/endpoint/number1?wsdl HTTP/1.0 ... Because the URI field is final internally, it is not supposed to change unless you did something with it in the getRequestPath(String) method or a different request was received. getUri() will return 'http://127.0.0.1:8871/jaxws-endpoint/endpoint/number1/' only if the request looks like the following: GET http://127.0.0.1:8871/jaxws-endpoint/endpoint/number1/ HTTP/1.0 ... Could you tell me what differences you've found?	1	1	https://issues.jboss.org/browse/NETTY-239
15841	NETTY-236	Is there a workaround for this? Right now this is a show stopper for me because I'm dealing with a legacy protocol that works in the described way...	1	1	https://issues.jboss.org/browse/NETTY-236
15842	NETTY-236	Thanks a lot for your time Trustin, I really appreciate it. I'm assuming then that currently there is no workaround for this scenario. Is that correct? I'm trying to do something like this on the client.... clientSocket.shutdownOutput(); Assert.assertEquals('0', (char) clientSocket.getInputStream().read());	0	0	https://issues.jboss.org/browse/NETTY-236
15843	NETTY-236	Is this feature in the pipe? It would be quite useful because it enables us to do a more orderly shutdown of the connection where we don't risk losing incoming traffic from the remote peer.	1	1	https://issues.jboss.org/browse/NETTY-236
15844	NETTY-236	Is now part of 4.0.0.x. You can now call Channel.shutdownInput() or Channel.shutdownOutput().	0	0	https://issues.jboss.org/browse/NETTY-236
15845	NETTY-155	I didn't realize that multicast already existed in netty. Where could I find the documentation on it? Thanks for letting me know, btw!	1	0	https://issues.jboss.org/browse/NETTY-155
15846	NETTY-153	Hi all, I'd like to request a further feature from RTSP protocol that would be nice to have in Netty. [RFC 2326|https://datatracker.ietf.org/doc/rfc2326/] for RTSP in its section 10.12 describes a method of interleaving binary data in RTSP stream. Those data may be sent from server to client or vise versa. The format is very simple: > Stream data such as RTP packets is encapsulated by an ASCII dollar > sign (24 hexadecimal), followed by a one-byte channel identifier, > followed by the length of the encapsulated binary data as a binary, > two-byte integer in network byte order. The stream data follows > immediately afterwards, without a CRLF, but including the upper-layer > protocol headers. Each $ block contains exactly one upper-layer > protocol data unit, e.g., one RTP packet. Although the existing RTSP codec is easy to extend to support interleaved data, it would be great to have such an extension provided natively. Is it realistic to have the extended codec in 3.2.0? Thanks.	1	1	https://issues.jboss.org/browse/NETTY-153
15847	NETTY-126	trustin, a couple of questions. // FIXME: Support both version 0 and 1 cookies (both for encoding and decoding) I coldn't extract the differences between 0 and 1, any chance you could shed some light? // FIXME: Encode all cookie fields, including domain, path, maxAge, secure, and comment. // FIXME: Decode all cookie fields, including domain, path, maxAge, secure, and comment Do you just want these added as fields to the cookie class and encoded.decoded if set by the user? // FIXME: CookieDecoder cannot assume that the first field is always the name-value pair. ok, what else could it be?	1	1	https://issues.jboss.org/browse/NETTY-126
15848	NETTY-126	> // FIXME: Support both version 0 and 1 cookies (both for encoding and decoding) > I coldn't extract the differences between 0 and 1, any chance you could shed some light? I think the difference is that version 0 cookies use 'expires' attribute and version 1 cookies use 'max-age' attribute, as described in the chapter 10 (HISTORICAL) of http://www.ietf.org/rfc/rfc2109.txt. I think we can simply convert 'expires' to 'max-age' and vice versa instead of adding the Expires attribute to the HttpCookie class. I also found that there's cookie version 2: http://www.ietf.org/rfc/rfc2965.txt. The version 2 adds more properties like 'Port', 'CommentURL', and 'Discard'. I think we need to support version 2, too. It's interesting that the version 2 cookie represents itself as version '1' cookie except that it uses a different header name. > // FIXME: Encode all cookie fields, including domain, path, maxAge, secure, and comment. > // FIXME: Decode all cookie fields, including domain, path, maxAge, secure, and comment > Do you just want these added as fields to the cookie class and encoded.decoded if set by the user? Yes. I added the fields for version 0 and 1 to the cookie class by myself, so what's left is to: * add the fields for version 2 * fix the decoder to understand version 0, 1, and 2 cookies. (HttpCookie.getVersion() should return 1 for version 2 cookies, as specified in the RFC.) * fix the encoder to be able to encode any version of cookies. (The desired version could be specified as an integer constructor parameter.) > // FIXME: CookieDecoder cannot assume that the first field is always the name-value pair. > ok, what else could it be? Check the example 5.1.3 of http://www.ietf.org/rfc/rfc2109.txt: Cookie: $Version="1"; Customer="WILE_E_COYOTE"; $Path="/acme" I think it can even be like this: Cookie: $Path="/acme"; $Version="1"; Customer="WILE_E_COYOTE";	0	0	https://issues.jboss.org/browse/NETTY-126
15849	NETTY-112	Alan, could you close this issue if this satisfies your need?	1	1	https://issues.jboss.org/browse/NETTY-112
15850	NETTY-112	On a server which sent the first two messages, and received the last, I see this: NioAcceptedSocketChannel(id: 513d764c-011f-1000-b629-0170773a61bd, /127.0.0.1:62046 => /127.0.0.1:8081) - (message: Welcome to darkstar.local!) NioAcceptedSocketChannel(id: 513d764c-011f-1000-b629-0170773a61bd, /127.0.0.1:62046 => /127.0.0.1:8081) - (message: It is Sat Feb 07 16:56:40 SAST 2009 now.) NioAcceptedSocketChannel(id: 513d764c-011f-1000-b629-0170773a61bd, /127.0.0.1:62046 => /127.0.0.1:8081) - (message: eee) It's a bit hard to distinguish between incoming and outgoing messages, am I doing something wrong?	1	1	https://issues.jboss.org/browse/NETTY-112
15851	NETTY-112	I think you are not using the latest revision. Could you try again with a fresh build?	1	1	https://issues.jboss.org/browse/NETTY-112
15852	NETTY-112	Trying with latest Netty 3.1.0.ALPHA4 from svn: NioAcceptedSocketChannel(id: 564dad4e-011f-1000-b6d9-018537fa90cb, /127.0.0.1:51527 => /127.0.0.1:8081) - (state: OPEN) NioAcceptedSocketChannel(id: 564dad4e-011f-1000-b6d9-018537fa90cb, /127.0.0.1:51527 => /127.0.0.1:8081) - (state: BOUND) NioAcceptedSocketChannel(id: 564dad4e-011f-1000-b6d9-018537fa90cb, /127.0.0.1:51527 => /127.0.0.1:8081) - (state: CONNECTED) org.jboss.netty.channel.DownstreamMessageEvent@f1235b - (write: Welcome to darkstar.local!) org.jboss.netty.channel.DefaultWriteCompletionEvent@8c3679 - (writtenAmount: 27) org.jboss.netty.channel.DownstreamMessageEvent@659db7 - (write: It is Sun Feb 08 16:32:27 SAST 2009 now.) org.jboss.netty.channel.DefaultWriteCompletionEvent@556d12 - (writtenAmount: 41) org.jboss.netty.channel.UpstreamMessageEvent@3a9bba - (received: eeee) Is this correct?	1	1	https://issues.jboss.org/browse/NETTY-112
15853	NETTY-112	Shall I checkout and try again? Another thing, with MINA if you added the logging handler at the beginning of the filter chain, you were shown hex representation of all characters. It's helped me a few times. Could/should this be done with Netty?	1	1	https://issues.jboss.org/browse/NETTY-112
15854	NETTY-109	It seems like the current implementation is supposed to work with the Local transport only. Can we make this work with any ChannelFactories?	1	1	https://issues.jboss.org/browse/NETTY-109

#	Requirement	Questions	Answered	Successfully Answered	URL
15855	NETTY-109	My findings so far: 1) ServletClientSocketChannelFactory itself could work with any ClientSocketChannelFactory. For now, it seems like it uses old socket I/O. Can we change this to accept any ClientSocketChannelFactory as a constructor parameter? For example: ServletClientSocketChannelFactory factory = new ServletClientSocketChannelFactory(new NioClientSocketChannelFactory(...)); or ServletClientSocketChannelFactory factory = new ServletClientSocketChannelFactory(new OioClientSocketChannelFactory(...)); 2) IIUC, your implementation should work any HTTP server that understands the HTTP tunneling protocol you designed. Therefore, it would be nice if we can replace 'Servlet' with something else. For example, ServletClientSocketChannelFactory could be renamed to HttpTunnelClientChannelFactory. Same applies to the package names; org.jboss.netty.channel.socket.servlet could be renamed to org.jboss.netty.channel.socket.http. 3) A ChannelFactory is supposed to create more than one Channel with different settings. Therefore, you need to create a subtype of SocketAddress and specify it when you initiate a connection attempt, rather than specifying it in the factory constructor. For example: ClientBootstrap b = new ClientBootstrap(new HttpTunnelClientChannelFactory(...)); b.connect(new HttpTunnelAddress("http://example.com/nettyServlet"); ... 4) URI is preferred to URL - HttpTunnelAddress could look like this: public class HttpTunnelAddress extends SocketAddress { public URI getUri() { ... } }	1	1	https://issues.jboss.org/browse/NETTY-109
15856	NETTY-108	The initial implementation looks fairly simple and OK. Considering most rough places will be cleaned up, there are a couple tiny things I've found: * Perhaps we don't need to depend on Executor at all? (i.e. firing an event immediately for minimal latency) * We might need to maintain an unbounded queue to prevent stack overflow though (the pinging-ponging case.) * The package should be org.jboss.netty.channel.invm rather than org.jboss.netty.channel.socket.invm. * You can extend AbstractChannelSink rather than implementing ChannelSink directly. * InvmServerChannel could extend AbstractServerChannel instead of AbstractChannel. * Invm -> InVm? I'm not sure this is better. Or should we replace it with 'Local'? (i.e. LocalChannelFactory) WDYT?	1	1	https://issues.jboss.org/browse/NETTY-108
15857	NETTY-108	* Perhaps we don't need to depend on Executor at all? (i.e. firing an event immediately for minimal latency) ok, but i guess this still has to be done in a separate thread? * We might need to maintain an unbounded queue to prevent stack overflow though (the pinging-ponging case.) Again, we just kick of a separate thread that pulls from the queue and calls fireMessageReceived * The package should be org.jboss.netty.channel.invm rather than org.jboss.netty.channel.socket.invm. ok * You can extend AbstractChannelSink rather than implementing ChannelSink directly. ok * InvmServerChannel could extend AbstractServerChannel instead of AbstractChannel. no probs * Invm -> InVm? I'm not sure this is better. Or should we replace it with 'Local'? (i.e. LocalChannelFactory) WDYT? actually i think i prefer local!	1	1	https://issues.jboss.org/browse/NETTY-108
15858	NETTY-108	>> Perhaps we don't need to depend on Executor at all? (i.e. firing an event immediately for minimal latency) > ok, but i guess this still has to be done in a separate thread? If it needs to be done in a separate thread a user can add ExecutionHandler (in org.jboss.netty.handler.execution) in the pipeline, so we don't need to do this in a separate thread. >> We might need to maintain an unbounded queue to prevent stack overflow though (the pinging-ponging case.) > Again, we just kick of a separate thread that pulls from the queue and calls fireMessageReceived This issue can be avoided by suppressing recursive calls by maintaining a ThreadLocal flag and event queue (unbounded). For example, take a look at here: http://tinyurl.com/9z2q89 (Check the member variable 'notifying.') Would this be fine for you? >> Invm -> InVm? I'm not sure this is better. Or should we replace it with 'Local'? (i.e. LocalChannelFactory) WDYT? > actually i think i prefer local! Cool! Let's go with 'Local' then. :) It would be somewhat confusing with 'ChannelLocal', http://tinyurl.com/8n4y5v, but I don't think it's a big deal.	0	0	https://issues.jboss.org/browse/NETTY-108
15859	NETTY-108	I have fixed several compatiblity issues with existing transports like NIO socket transport. It should behave more realistically. :) On the other hand, I simplified how a local transport is instantiated. LocalAddresses are managed internally when you bind / connect, so you don't need to assign a name when a ChannelFactory is created anymore. This is a pretty big change that might surprise Andy, but it seems like the local example works just fine. (I had to fix a bug in the example's PrintHandler though.) What's left is to: * ensure some event ordering (i.e. don't fire message event until channelConnected() is fired) * make LocalChannel.getParent() return the parent * ensure that a LocalServerChannel is notified with childChannelOpen() and childChannelClosed() * make LocalChannel.toString() returns a string with correct local/remote addresses ('null => null' for now)	0	0	https://issues.jboss.org/browse/NETTY-108
15860	NETTY-79	That's also an option I'm thinking about. However, I'm somewhat concerned about the performance implications of running idleness detection in I/O thread. Idleness detection is performed periodically, but it scans through the whole list of open channels which can be time consuming (i.e. O(N) operation.) Therefore, at least I want to make it run in a separate thread with lower priority. Does it make sense to you? :)	0	0	https://issues.jboss.org/browse/NETTY-79
15861	NETTY-79	I'm not very confident that it will be a very time consuming task. However, it is still true that it takes a constant amount of time. A separate thread approach adds another overhead of maintaining a map of all open channels in a thread-safe way, which is likely to cause contention. I'm thinking of adjusting idleness check interval dynamically from 1 second to 3 seconds depending on the number of connections. WDYT?	0	0	https://issues.jboss.org/browse/NETTY-79
15862	NETTY-79	Just finished the implementation of HashedWheelTimer: http://tinyurl.com/7ka4ey I used Hashed Timing Wheel which is described here: http://www.cse.wustl.edu/~cdgill/courses/cs6874/TimingWheels.ppt What's left is ChannelHandlers that utilizes HashedWheelTimer (i.e. ReadTimeoutHandler and WriteTimeoutHandler.)	1	1	https://issues.jboss.org/browse/NETTY-79
15863	NETTY-79	The current implementation notifies your handler with an ExceptionEvent (ChannelReadTimeoutException or ChannelWriteTimeoutException). The cost of creating an exception is zero because it's pre-instantiated. Would this work for you?	1	1	https://issues.jboss.org/browse/NETTY-79
15864	NETTY-79	I must admit that I am not terribly familiar with Nettty (yet), and there do not seem to be jUnit tests for this now, could you please give a brief example of how to setup the bootstrap (and constructing instances of the *TimeoutHandler classes, this is what I didn't get right now) to be able to both receive read and write timeouts?	1	1	https://issues.jboss.org/browse/NETTY-79
15865	OSJC-261	[~maxandersen] In follow-up to the email trail regarding the use of proxy with this client. I have learned that okhttpclient when run with the openshift tooling is initialized with an 'EclipseProxySelector' and only honors the network settings from the eclipse preferences. It does not appear to honor your system network proxy. Is this acceptable? We could probably modify if needed to honor both, but this seems unnecessary based on the concerns you had.	1	1	https://issues.jboss.org/browse/OSJC-261
15866	OSJC-261	Interesting - I thought SPDY was needed for upgrading the connection securely ? or is that only relevant for browsers and we can do more custom logic on our end ?	1	1	https://issues.jboss.org/browse/OSJC-261
15867	OSJC-250	Patch looks clear and simple from my view. I'll work on adding some API in openshift-tools' RSync class to make use of it once this is accepted by [~jcantrill]. [~adietish] did you test it? Does it work? ;)	1	1	https://issues.jboss.org/browse/OSJC-250

#	Requirement	Questions	Answered	Successfully Answered	URL
15868	OSJC-132	Hi [~chirino] sorry for the late reply, this went somehow unnoticed in my radar. I'm not sure about the time we have to implement this, we're on heavy pressure to get tooling/client-lib for v3 done by this summer. Is this an absolut must or is there even a lucky chance where you could contribute this?	0	0	https://issues.jboss.org/browse/OSJC-132
15869	OSJC-101	If I query the geargroups of an application via {code} curl -H "Accept: application/json; version=1.2" --user <USER>:<PASSWORD> https://openshift.redhat.com/broker/rest/domains/foogoo/applications/php/gear_groups -X GET | json_reformat | less {code} I get the following response: {code} { "api_version": 1.2, "data": [{ "additional_gear_storage": 0, "base_gear_storage": 1, ... {code} [~bparees]: Are these the 2 properties that you need? Do you have any pointers to what the numbers exactly mean?	1	1	https://issues.jboss.org/browse/OSJC-101
15870	OSJC-95	As far as I can tell the enum sizes are not actually used anywhere, except in the tests. Can we just remove the enums and rewrite the tests? Nothing in OSJC or JBossTools-OpenShift seem to be dependent on checking them (or else weird sizes would show up in the lists now anyways...)	1	1	https://issues.jboss.org/browse/OSJC-95
15871	OSJC-93	Per discussion in IRC today, we have a working build for this, which is coupled to your existing openshift component build: https://hudson.qa.jboss.com/hudson/job/openshift-java-client-master/ https://hudson.qa.jboss.com/hudson/job/jbosstools-3.3_trunk.component--openshift/ How will openshift component pick up the new client jar? Is the assumption that it'll see it on the trunk composite site [1] and therefore build against that? If so, then you'll want to add your new component's staging folder [2] and previous staging folder [3] to the composite site in SVN [4], then kick an rsync [5] to push the SVN change to [1]. [1] http://download.jboss.org/jbosstools/builds/staging/_composite_/trunk/ [2] http://download.jboss.org/jbosstools/builds/staging/openshift-java-client-master/all/repo/ [3] http://download.jboss.org/jbosstools/builds/staging.previous/openshift-java-client-master/all/repo/ [4] https://svn.jboss.org/repos/jbosstools/trunk/download.jboss.org/jbosstools/builds/staging/_composite_/trunk/ [5] http://hudson.qa.jboss.com/hudson/view/DevStudio/view/DevStudio_All/job/jbosstools-download.jboss.org-rsync-from-svn/ If not, please clarify.	1	1	https://issues.jboss.org/browse/OSJC-93
15872	OSJC-93	-uh, if people want to fetch github sources and just build the single non-osgi jar, they TOTALLY can.- -The "pollution", as you call it, of having this upstream plugin packaged up as an osgi jar, wrapped w/ a feature, wrapped with a site.xml, published to our _composite_ site, meant we could consume it like we do any other upstream plugin.- -Why is that bad? And why would you rather the overhead of manually committing embedded jars in SVN when you can just pull them from upstream via our existing Jenkins build infra? You've railed for years about the suck of Modeshape/Teiid having to commit binaries into SVN, yet unless I'm mistaken, that's exactly what you're proposing here.- Can we move the OpenShift component code to a second github repo, so that the work done here can be reused? If nothing else, it would allow us to start gradually moving components out of SVN and into git.	1	1	https://issues.jboss.org/browse/OSJC-93
15873	OSJC-93	Andre - isn't this already done and the issue can be resolved ? What is left?	1	1	https://issues.jboss.org/browse/OSJC-93
15874	OSJC-59	The work that I did for this issue has been listed as done by work within a commit by develepercorey on OSJC-53, however no references to the refactors appear in OSJC-53. Is this still something I can finish up?	0	0	https://issues.jboss.org/browse/OSJC-59
15875	OSJC-45	java-client the test-suite hits many 500 "internal error" on INT (34 currently and started happening on the 2013-04-10). Most of them happen when the client tries to list the available applications: {"data":null,"errors":{},"messages":[{"exit_code":-1,"field":null,"severity":"error","text":"\nReference ID: f0c6ada8cd6dd8f36cb3abc1ce9bc487"}],"status":"internal_server_error","supported_api_versions":[1.0,1.1,1.2,1.3,1.4],"type":null,"version":"1.0"} at com.openshift.internal.client.httpclient.UrlConnectionHttpClient.createException(UrlConnectionHttpClient.java:204) at com.openshift.internal.client.httpclient.UrlConnectionHttpClient.write(UrlConnectionHttpClient.java:176) at com.openshift.internal.client.httpclient.UrlConnectionHttpClient.post(UrlConnectionHttpClient.java:146) at com.openshift.internal.client.httpclient.UrlConnectionHttpClient.post(UrlConnectionHttpClient.java:142) at com.openshift.internal.client.RestService.request(RestService.java:146) at com.openshift.internal.client.RestService.request(RestService.java:98) ... 68 more Caused by: java.io.IOException: Server returned HTTP response code: 500 for URL: https://int.openshift.redhat.com/broker/rest/domains/1366023591076/applications at sun.net.www.protocol.http.HttpURLConnection.getInputStream(HttpURLConnection.java:1459) at sun.net.www.protocol.https.HttpsURLConnectionImpl.getInputStream(HttpsURLConnectionImpl.java:234) at com.openshift.internal.client.httpclient.UrlConnectionHttpClient.write(UrlConnectionHttpClient.java:174) ... 72 more The very same is not happening neither on STG nor on PROD. I was wondering if there's any particular reason for this, anything wrong on my side or is it STG not being stable? Another frequent error that keeps popping up here and there (on PROD and INT, very rarely on INT currently) is the following: com.openshift.client.OpenShiftEndpointException: Could not request https://openshift.redhat.com/broker/rest/user: Operation failed.Reason given: "OpenShift::AuthServiceException" ... at org.codehaus.plexus.classworlds.launcher.Launcher.main(Launcher.java:352) Caused by: com.openshift.internal.client.httpclient.HttpClientException: {"data":null,"messages":[{"exit_code":null,"field":null,"severity":"error","text":"OpenShift::AuthServiceException"}],"status":"internal_server_error","supported_api_versions":[1.0,1.1,1.2,1.3,1.4],"type":null,"version":"1.0"} at com.openshift.internal.client.httpclient.UrlConnectionHttpClient.createException(UrlConnectionHttpClient.java:204) at com.openshift.internal.client.httpclient.UrlConnectionHttpClient.get(UrlConnectionHttpClient.java:113) at com.openshift.internal.client.RestService.request(RestService.java:144) at com.openshift.internal.client.RestService.request(RestService.java:98) ... 67 more Caused by: java.io.IOException: Server returned HTTP response code: 500 for URL: https://openshift.redhat.com/broker/rest/user at sun.net.www.protocol.http.HttpURLConnection.getInputStream(HttpURLConnection.java:1459) at sun.net.www.protocol.https.HttpsURLConnectionImpl.getInputStream(HttpsURLConnectionImpl.java:234) at com.openshift.internal.client.httpclient.UrlConnectionHttpClient.get(UrlConnectionHttpClient.java:111) Thanks! André {quote} I started talking to Lili Nader which told me to look the operation references reported in the error up in the broker logs. I answered her that I could not do that since I had no root access on INT. We need to further follow up on this.	0	0	https://issues.jboss.org/browse/OSJC-45

#	Requirement	Questions	Answered	Successfully Answered	URL
15876	OSJC-44	pushed to master and rebased. verified on jenkins which now reports: {code} com.openshift.client.OpenShiftEndpointException: Could not request https://stg.openshift.redhat.com/broker/rest/api: java.net.ConnectException: Connection timed out at com.openshift.internal.client.RestService.request(RestService.java:106) at com.openshift.internal.client.RestService.request(RestService.java:91) at com.openshift.internal.client.RestService.request(RestService.java:72) at com.openshift.internal.client.AbstractOpenShiftConnectionFactory.getConnection(AbstractOpenShiftConnectionFactory.java:34) at com.openshift.client.OpenShiftConnectionFactory.getConnection(OpenShiftConnectionFactory.java:161) {code}	1	0	https://issues.jboss.org/browse/OSJC-44
15877	PLANNER-840	There is a trade-off between - adding more information to the trace log line - verbosity of the trace log line. What are the use cases to need those 2 additional information you need? (When in doubt, I 'd leave it out). There is 3) case btw: it's not just non doable moves that aren't mentioned, but also filtered moves/entities/values aren't mentioned (which would have performance implications if we track that).	0	0	https://issues.jboss.org/browse/PLANNER-840
15878	PLANNER-810	[~ederign] Datamodeler also can't copy-paste urls into a new browser, although the content of the url does seem to indicate that it's being trying to work, could this be an general uberfire problem?	1	0	https://issues.jboss.org/browse/PLANNER-810
15879	PLANNER-793	{quote}{Unit test needed for if a getter is overriden and the parent was autodetect but the child has an explicit annotation - and vica versa}{quote} What are the use cases for this? Would you for example want to override a {{getFactList()}} getter detected as a {{@ProblemFactCollectionProperty}} to {{@ProblemFactProperty}}? Anything else? I can only think of changing an entity property to problem fact property but that doesn't make sense to me, so I don't think it needs to be tested.	0	0	https://issues.jboss.org/browse/PLANNER-793
15880	PLANNER-790	1) I think this duplicates the open issue PLANNER-151 (which support not just XML, but like all XML have a java Config API alternative approach). 2) Covered already by EasyJavaScoreCalculator? 3) Covered already by the programmatic api (see docs chapter 4)? What do you think (after researching those pointers above)? Can this issue be closed as duplicate?	0	0	https://issues.jboss.org/browse/PLANNER-790
15881	PLANNER-763	[~jsniezek] Hey Joe, have you had a chance to look at the result of the "import example" dialog of Matej? Your feedback is welcome. Mine is above. The feature itself is great, this is just some polishing.	1	1	https://issues.jboss.org/browse/PLANNER-763
15882	PLANNER-707	The old repo's are here: https://github.com/guvnorngtestuser1?tab=repositories https://github.com/mbarkley/app-former-playground Don't remove them (would break 6.x) but clearly add a note that says "MOVED to https://github.com/droolsjbpm/kie-wb-playground"	0	0	https://issues.jboss.org/browse/PLANNER-707
15883	PLANNER-695	bq. Just heard of a case where they had non-unique id's on 2 different instances with different content of the same class. So that should definitely fail fast So this means it is forbidden to add two working objects with the same ID unless it is the same instance, right? Even if the two different instances are equal it should fail. It could also happen that the two instances have same ID, are equal and still there is some difference in their content (fields) which is not covered by equals(). This likely a bug in user's code but I guess we don't want to detect this case. On the other hand adding the same instance twice should pass or fail? If it's added it basically means no change but still there may be a reason to fail for example to detect a bug on a higher level. Lastly, how should this work with EQUALITY strategy? Adding the same instance twice is OK but adding two different instances that are equal should fail? This could detect bugs in user's equals() implementation.	0	0	https://issues.jboss.org/browse/PLANNER-695
15884	PLANNER-689	Agreed, if it doesn't change the 1 depot files (all current vrp files), which it doesn't I think. Would you be willling to send in a Pull Request for this change?	1	0	https://issues.jboss.org/browse/PLANNER-689
15885	PLANNER-667	Neither of these solutions takes into account potential nullity of the fields, nor do they allow distinguishing between natural ordering and user-provided ordering. In the past, writing Comparators was painful and people hated it. However, the Java 8 `Comparator` convenience methods are awesome. They handle all the corner cases and they are simple enough to use. Let's not over-engineer it, let's not bring annotation scanning into it, let's not introduce our own logic - let's have people simply write a Java 8 one-liner comparator.	0	0	https://issues.jboss.org/browse/PLANNER-667
15886	PLANNER-666	[~jlocker] Thanks for pointing this out Jiri. Yes, the change should be there, could you please a JIRA to track this? Thanks.	0	0	https://issues.jboss.org/browse/PLANNER-666
15887	PLANNER-664	This report looks valid. Can you also turn on DEBUG and TRACE logging and add that here? That will give me full confidence that it's a valid bug.	1	1	https://issues.jboss.org/browse/PLANNER-664
15888	PLANNER-664	I'm currently using Optaplanner 6.2. I have compiled a 6.2 version patched with your modifications. When I run the test program I attached to this issue with this 6.2 patched version, no hard rules are broken anymore but no process are placed. However 150 processes should be placed on the 75 hosts. Is it normal?	1	0	https://issues.jboss.org/browse/PLANNER-664
15889	PLANNER-659	[~ge0ffrey]: can you please check if there is now everything that should be : http://docs.jboss.org/optaplanner/release/6.4.0.Final/optaplanner-javadoc/index.html	1	1	https://issues.jboss.org/browse/PLANNER-659
15890	PLANNER-659	So it looks good. Is there a commit or PR with the changes to the assembly so all future versions are fixed too?	1	1	https://issues.jboss.org/browse/PLANNER-659
15891	PLANNER-642	Is your patch available on a github repo too (feel free to send it as a PR)? This bug doesn't surpise me - and we have to fix it of course - but the manner is difficult. *Workaround*: in the DistanceMeter, make it so the distance to/from any depot is 0, sot hey are sorted before the Customers (stops).	1	0	https://issues.jboss.org/browse/PLANNER-642
15892	PLANNER-642	[~ge0ffrey], thanks for your response. Created a pull request with the content of the patch (can you also delete the older attachment, it missed some code). Used the issue key in the PR message, so you may have to fix the automatic transition this issue made. As for the workaround: this will indeed work for now, but we have to make sure the distribution size maximum is far above the number of depots (in our own problem all the vehicles have their own starting location)	0	0	https://issues.jboss.org/browse/PLANNER-642
15893	PLANNER-620	3) My personal taste is a separate class, but I also fine with a *static* inner class. I've added some code above in the description. Would it be possible to generate that? 5) not a big fan of this, due to same reasons at 1: the comparator should really be compiled at build time, not runtime.	0	0	https://issues.jboss.org/browse/PLANNER-620
15894	PLANNER-607	This requires further discussion [~ge0ffrey] Thinking about it now, not sure whether we should use different model at all. Ideally we'd like to test whether the configuration works correctly as a whole. If we use different data model, it can get out of sync with rule definitions, value selectors, etc. wdyt?	0	0	https://issues.jboss.org/browse/PLANNER-607

15896	PLANNER-551	Walter, Paulo's looking at the UF support for this (UF-288), once that's done - making this issue easier to fix, would you mind taking a look at this one?	1	1	https://issues.jboss.org/browse/PLANNER-551
15897	PLANNER-551	Hello Joe, Would you mind take a look and provide the corresponding icons for the "drools&jbpm", "advanced", and "persistence" tool windows? Regards, Walter.	1	1	https://issues.jboss.org/browse/PLANNER-551
15898	PLANNER-505	Geoffrey, I am trying to figure out the service API. I think the basic format would be: To get the list of the solvers: {code}GET /services/rest/server/containers/instances/<containerId>/solvers {code} To create a solver: {code}PUT /services/rest/server/containers/instances/<containerId>/solvers/<solverId> {code} To update a solver (to start a solver, i.e., call the solve() method, or to call terminateEarly()) {code}POST /services/rest/server/containers/instances/<containerId>/solvers/<solverId> {code} To get the solver status: {code}GET /services/rest/server/containers/instances/<containerId>/solvers/<solverId> {code} To get the best solution: {code}GET /services/rest/server/containers/instances/<containerId>/solvers/<solverId>/bestsolution {code} To dispose a solver: {code}DELETE /services/rest/server/containers/instances/<containerId>/solvers/<solverId>{code} I don't think it would be possible, due to the stateful nature of each solver, to create more than one instance of each solver configuration on the same container. Do you agree? I am not sure how to prevent it though, so it would be the user's responsibility.	1	1	https://issues.jboss.org/browse/PLANNER-505
15899	PLANNER-505	Hi Edson, In a multi-tenancy scenario, it's common to have multiple Solver instances of the same solver configuration running in parallel. Think hospital nurse rostering "as a service". "To get the solver status" - I presume this returns the best solution (which includes the best score). We can implement this adding Solver.addEventListener() that listens to new best solution events (which is on the solver thread) and stores it in an AtomicReference, so that GET rest call (which is on a servlet thread) can simply get the latest best solution from that AtomicReference and marshall it back. (Note the best solution is already "planning cloned" (see docs) by the solver itself, so most race conditions are impossible, but some with ProblemFactChanges (not supported in this phase) will be in the future). Let's meet up for a real-time discussion?	1	1	https://issues.jboss.org/browse/PLANNER-505
15900	PLANNER-505	Geoffrey, thinking further about the operations and which data they require, is this correct? * create a solver: all it requires is the name of the solver configuration file? Is it possible that we will have to support other parameters in the future? * start the solver: requires the input data. Anything else? If a solver is stopped later on, can it be re-started? Can I reuse the same solver with a different input data set? * check the status: what are the possible status a solver can be? IDLE, SOLVING, FINISHED? anything else? * get solution: this will return the best solution computed up to that moment, correct? * stop: I think you called this "early termination". Is any parameter necessary? * dispose: does not require any data.	1	1	https://issues.jboss.org/browse/PLANNER-505
15901	PLANNER-485	How about implementing some MRU cache, of a configurable size? Seems easier (and faster) than to try to create some decision logic around entities.	0	0	https://issues.jboss.org/browse/PLANNER-485
15902	PLANNER-485	how about use 2Dim implementation of [1]? it's efficient structure to store data in space. then we could find in log time good candidates for selection. Or am I missing something? [1] https://en.wikipedia.org/wiki/K-d_tree	0	0	https://issues.jboss.org/browse/PLANNER-485
15903	PLANNER-485	+1for the idea of also also support Most Recently Used cache strategies somehow, or maybe just a Most Nearby cache, and swapping the rest out to disk. Implementing this in a reliable, platform independent matter won't be easy. Where's the disk file? What happens in an openshift environment?	1	1	https://issues.jboss.org/browse/PLANNER-485
15904	PLANNER-485	Can we leave that to Infinispan? Let's not invent a cache where we already have one.	1	1	https://issues.jboss.org/browse/PLANNER-485

#	Requirement	Questions	Answered	Successfully Answered	URL
15905	PLANNER-478	[~jlocker] Would it be possible to check the performance regressions tests impact of these changes? especially on chained vars and tabu search. See commit on the right to see actual impact.	1	1	https://issues.jboss.org/browse/PLANNER-478
15906	PLANNER-467	We already have these distributions, as we're just piggy-backing on the kie distributions (but our stuff is masked out with the role plannermgmt). We need to look at how we'll expose this in docker. Shall we get a separate docker image for optaplanner which is basically the same as the drools one with an extra role?	0	0	https://issues.jboss.org/browse/PLANNER-467
15907	PLANNER-423	LookAndFeels to investigate: - Nimbus - Part of JDK IIRC? What is the minimum JDK version? We need to support 6. Yes, it's part of 6: https://docs.oracle.com/javase/tutorial/uiswing/lookandfeel/nimbus.html - Sustance http://insubstantial.github.io/insubstantial/substance/ - http://stackoverflow.com/questions/10134516/how-can-i-create-a-modern-looking-java-desktop-application - http://stackoverflow.com/questions/2934337/open-source-laflook-n-feel-for-java-swing-application - JGoodies. Has aged IIRC. - Which ones does IntelIJ support? See it's settings. Several of them are not open source (such as Alloy IIRC). The LaF will probably be a separate dependency jar, so - It needs to be in Maven Central (unless it's in the JDK) - It needs to be a compatible open source license (ASL, BSD, MIT) or maybe LGPL but definitly not GPL. See readme's dependency reqs list for the full req list. Also do a full build and test the runExamples.sh script. Normally that should all work out now with the new assembly xml's that put that new dependency jar in the correct folder, which should be /examples/binaries, not /binaries.	0	0	https://issues.jboss.org/browse/PLANNER-423
15908	PLANNER-411	Didn't test with any specific version (just an older master, before the uninitializedVariableCount change) and I get this exception when running the aggregator: {code} Exception in thread "main" java.lang.NullPointerException at org.optaplanner.benchmark.impl.result.SolverBenchmarkResult.determineTotalsAndAverages(SolverBenchmarkResult.java:310) at org.optaplanner.benchmark.impl.result.SolverBenchmarkResult.accumulateResults(SolverBenchmarkResult.java:289) at org.optaplanner.benchmark.impl.result.PlannerBenchmarkResult.accumulateResults(PlannerBenchmarkResult.java:288) at org.optaplanner.benchmark.impl.aggregator.swingui.BenchmarkAggregatorFrame.initPlannerBenchmarkResultList(BenchmarkAggregatorFrame.java:236) at org.optaplanner.benchmark.impl.aggregator.swingui.BenchmarkAggregatorFrame.init(BenchmarkAggregatorFrame.java:129) at org.optaplanner.benchmark.impl.aggregator.swingui.BenchmarkAggregatorFrame.createAndDisplay(BenchmarkAggregatorFrame.java:96) at org.optaplanner.examples.common.app.CommonBenchmarkApp.buildAndBenchmark(CommonBenchmarkApp.java:71) at org.optaplanner.examples.app.GeneralOptaPlannerBenchmarkApp.main(GeneralOptaPlannerBenchmarkApp.java:24) {code} The uninitializedVariableCount in SingleBenchmarkResult is null.. this could be fixed by using some sort of a default value.	1	1	https://issues.jboss.org/browse/PLANNER-411
15909	PLANNER-401	* The separate JVM requirement was dropped, see PLANNER-428 * Naming SubSingleBenchmarks ** Make a vote + proposals * Find a way for the user to set the number of benchmarks in the config (default to one), run it that many times. ** Make a vote the exact syntax and naming + proposals * Aggregate the results in the report: drop down menu in report to display individual runs, avg, med, maybe stddev (also display a violin (box) plot - where?). * Choose one of the statistics (average) and use that as the outcome of the single benchmarks -> Do not change the SingleBenchmarkResult interface, apart from renaming. * Merging SubSingleStatistics ** Make a vote (reference to meeting with Geoffrey) + proposals * Details & questions ** What about uninitialized subsingles? *** Handle them just like scores, add a link to PLANNER-405 where applicable. ** What about failed subsingles? *** Handle them just like singles, propagate up (overrides score). ** What about violin plot not supported OOTB in JFreeChart? *** [Violin plots vs box plots|http://www.cerebralmastication.com/2009/02/box-plot-vs-violin-plot-in-r/] *** Ask on their forums, create a JIRA to follow up on this. *** Use Box plot for now, migrate later, see PLANNER-429 and http://stats.stackexchange.com/questions/136160/jfreechart-boxplot-appearance	1	1	https://issues.jboss.org/browse/PLANNER-401
15910	PLANNER-401	repeated single benchmark runs? * A1: SubSingleBenchmark ** Pro: Falls into it's place in the hierarchy nicely ** Con: The name sounds weird ** *Votes*: +1 by [~ge0ffrey], [~oskopek] * A2: SingleBenchmarkRepetition ** Pro: The name is logical and concise ** Con: Doesn't fall into it's place in the hierarchy very intuitively ** *Votes*: +1 by [~ge0ffrey], +0 by [~oskopek] * A3: Rename SingleBenchmark to RepeatedSingleBenchmark (or anything else), rename SubSingleBenchmark to SingleBenchmark ** Pro: Could improve the readability/understandability considerably ** Con: A lot of renaming/rewriting in the code and docs ** Con: Will confuse users/developers for a while ** *Votes*: +0 by [~ge0ffrey], +0.5 by [~oskopek] * An: ... (further proposals welcome) *Vote B*: How do we name the configuration setting that lets the user configure the number of run repeats of single benchmarks? (prefixes depend on where we place the setting in the benchmark config) * B1: repeatCount ** *Votes*: +0 by [~ge0ffrey], [~oskopek] * B2: repeats ** *Votes*: -1 by [~ge0ffrey], [~oskopek] * B3: subSingleCount (adjusted to the result of Vote A) ** *Votes*: +1 by [~ge0ffrey], [~oskopek] * Bn: ... (further proposals welcome) *Vote C*: Where do we let the user configure the number of run repeats of single benchmarks? * C1: In solverBenchmark->problemBenchmarks ** Pro: can be inherited ** Pro: can be set per solverBenchmark ** Con: too deep? ** Con: cannot be set individually per singleBenchmark ** *Votes*: -0.5 by [~ge0ffrey], -1 by [~oskopek] * C2: In solverBenchmark ** Pro: can be inherited ** Pro: can be set per solverBenchmark ** Con: too high in the hierarchy, given it references single benchmarks? ** Con: cannot be set individually per singleBenchmark ** *Votes*: +1 by [~ge0ffrey], [~oskopek] * C3: In plannerBenchmark (globally) ** Con: cannot be inherited ** Con: cannot be set per solverBenchmark ** Con: too high in the hierarchy, given it references single benchmarks ** Con: cannot be set individually per singleBenchmark ** *Votes*: -1 by [~ge0ffrey], [~oskopek] * C4: (Somehow) per singleBenchmark with a default per solver benchmark ** Pro: can be inherited ** Pro: can be set per solverBenchmark ** Con: too low in the hierarchy, makes the configuration too granular and confusing? ** Pro: can be set individually per singleBenchmark ** *Votes*: -0.5 by [~ge0ffrey], [~oskopek] * Cn: ... (further proposals welcome) *Vote D*: How do we merge (Sub) SingleStatistics of the repeated single benchmark runs? * D1: We only look at the first subsingle and ignore the rest for the statistics ** Con: Arbitrary choice ** Con: Doesn't fit with the summary stats ** *Votes*: -1 by [~oskopek] * D2: Take the median subsingle. This is a real one and it's not an edge case. Median according to SingleBenchmarkRankingComparator (not user pluggable). If subsingle count is even, take the worse one of the 2 middle ones. ** Pro: Finds a _representative_ benchmark run that is also real at the same time ** Pro: Easier to implement ** Con: The median is not the average, so it will not be the same as the summary statistics ** *Votes*: +1 by [~oskopek] * D2b: Adjust summaries to use median ** Con: if hard broken or uninitialized in 1 subsingle, it isn't shown in the summary statistics ** *Votes*: -1 by [~ge0ffrey], [~oskopek] * D2c: Put median in dropdown (in addition to the average summary statistics (score)) ** Pro: Definitely better than not doing this ** *Votes*: +1 by [~oskopek] * D3: Average the single statistic points with some sort of moving average ** Pro: Is an average case, is indicative of the underlying individual run results ** Con: Isn't real time-lined data, the data doesn't tell the user much ** *Votes*: -0.5 by [~oskopek] * D4: [~jvahala]: Combine D2 with D3: Use the median, add a moving arithmetic average (or other sensible statistic), plot them on the same chart with the min/max, add distribution shading (frequency of values in a given area on the chart) ** Pro: Is quite descriptive about the average case, outliers and shows the distribution between them ** Con: Is the result worth the (implementation) cost? JFreeChart probably doesn't support shading in the way we want. ** Details: [in this comment|https://issues.jboss.org/browse/PLANNER-401?focusedCommentId=13105265&page=com.atlassian.jira.plugin.system.issuetabpanels:comment-	1	1	https://issues.jboss.org/browse/PLANNER-401

#	Requirement	Questions	Answered	Successfully Answered	URL
15911	PLANNER-401	* Where do we let the user configure the number of run repeats of single benchmarks? ** +1 "C2: In solverBenchmark" Seems perfect to me ** -1 "C3: In plannerBenchmark (globally)" because doing it with C2 in <inheritedSovlerBenchmark> is the same ** -0.5 C4 and C1: overkill. YAGTNI. Or show me a use case to disprove this :) Where/when does a user want a difference in subsingle repeat count? * Between 2 solver configs if the first solver config doesn't rely on anything random (First Fit Decreasing, Custom initializer, etc) and the second does (Late Acceptance) * That's it. I see no reason to ever use a different repeat count per dataset.	0	0	https://issues.jboss.org/browse/PLANNER-401
15912	PLANNER-387	Are you sure the scoreDrl string is correct? That exception happens if it can't find the classpath resource from the classloader argument: https://github.com/droolsjbpm/optaplanner/blob/master/optaplanner-core/src/main/java/org/optaplanner/core/config/score/director/ScoreDirectorFactoryConfig.java#L384 Can you try doing a toString() of the classloader you're giving to build the SolverFactory. Does it equal "org.optaplanner.core [280]" or something else?	0	0	https://issues.jboss.org/browse/PLANNER-387
15913	PLANNER-387	are you sure that just fixing tests will resolve failing issue? ibm classloader is inconstistent with other classloaders in attributes and methods, I am not sure if methods which planner uses are same.	1	1	https://issues.jboss.org/browse/PLANNER-387
15914	PLANNER-372	Isn't this one resolved?	1	1	https://issues.jboss.org/browse/PLANNER-372
15915	PLANNER-368	[~jsniezek] I attached sample screenshots (termination.zip) of current implementation. Initially the tree is empty (termination_empty.png). Selecting "Add termination" option on the root/nested termination element displays a popup (termination_add_popup.png) where different termination types and their values can be picked. The results are added to the tree (termination_items.png). Nested terminations can be expanded/collapsed. All items but the root termination element can be removed. Removing nested termination element removes the whole subtree of its children. Could you please share your ideas from UX perspective?	1	0	https://issues.jboss.org/browse/PLANNER-368
15916	PLANNER-359	is specifying probability distribution optional here?	1	1	https://issues.jboss.org/browse/PLANNER-359
15917	PLANNER-359	and what if I change SORTED to RANDOM and add probability distribution? It still fail fast for me, but I don't see reason why.	1	1	https://issues.jboss.org/browse/PLANNER-359
15918	PLANNER-359	Which code snippets fail fast for you?	1	0	https://issues.jboss.org/browse/PLANNER-359
15919	PLANNER-359	I think the code above fails because the CH Placer can not work with never ending entity selectors, such as selectionOrder RANDOM. The rest of that config isn't relevant any more (including the nearby stuff). What does the error message state? But the valueselector with nearby selection itself, doesn't care what selectionOrder the entitySelector is using. That entity selectionOrder doesn't impact (as in "prohibits options in") the value selector.	0	0	https://issues.jboss.org/browse/PLANNER-359
15920	PLANNER-357	Richard also agrees with Jiri: "we have to define twice if we choose to have SimpleScore or HardScoreScore : once in the java class implements definition, and a 2nd time in the XML configuration file. Of course, an error is raised if there is a discrepency between the 2. I was wondering if it would be feasible to only define it once?" We should find a way to fix this. Proposal A) Remove the solver config line. The problem is that *the domain class defines the Score class, while the solver config (xml file usually) defines the ScoreDefinition instance*. A ScoreDefinition is the factory (and more) of Score. But Score instances (such as HardSoftScore) don't have a reference to their ScoreDefinition (such as HardSoftScoreDefinition) because they need to behave like super lightweight value classes (such as Long, Double, BigDecimal, LocalDate) when being serialized and exchanged. The real problem is that a ScoreDefinition _instance_ exists at bootstrap time, but _no_ Score instance exists as bootstrap time. Let me explain differently: Is it possible to determine a ScoreDefinition instance from looking at a Score instance? Yes. But we don't have a Score instance in the domain model at configuration time (there is no Solution instance yet, only a class). We do have a Score class (as a generic type even - but we can actually extract that despite erasure). Is it possible to determine a ScoreDefinition instance from looking at a specific Score class? No. For example, a BendableScore(Definition) has a hard and soft levelCount int. Those 2 ints are only known by the instances, not by the classes, therefor a Score class cannot unambiguously define the Score instance or ScoreDefinition instance.	1	1	https://issues.jboss.org/browse/PLANNER-357
15921	PLANNER-356	Do we want to do this?	1	1	https://issues.jboss.org/browse/PLANNER-356
15922	PLANNER-356	So, this is my idea of implementation: * All getters annotated with ```@ProblemFactCollectionProperty``` must return a collection type. All elements in these collections would be added among facts. * All getters annotated with ```@ProblemFactProperty``` will have their return values added among facts. * Support for ```getProblemFacts()``` will be removed altogether. Since the ```Solution``` interface is going away shortly after this is done (PLANNER-436), users will have to make compile-time changes to their code - and therefore will move to use the annotations. * This JIRA will not deal with the removal of ```Solution```. Instead, it will be limited to replacing the getter with annotations. What do others think?	1	1	https://issues.jboss.org/browse/PLANNER-356
15923	PLANNER-352	Quick question... what happens when I add the annotation on both the variable and the getter for the variable? And what if those two have different value range providers?	1	0	https://issues.jboss.org/browse/PLANNER-352
15924	PLANNER-343	That NoSuchMethodError is wierd. *Such an error only happens if the runtime classpath differs from the compilation classpath.* This line compiles, so during compilation it's correct. As of 6.3.0-SNAPSHOT, we're using reflections 0.9.10 {code} builder.addUrls(ClasspathHelper.forPackage(packageInclude, (ClassLoader[]) null)); {code} Are your tests using the classpath of 6.3.0-SNAPSHOT and therefore 0.9.10? Note that in 6.2, kie used an older reflections version, 0.9.9-RC1 or something.	1	1	https://issues.jboss.org/browse/PLANNER-343

#	Requirement	Questions	Answered	Successfully Answered	URL
15925	PLANNER-343	automatic domain scan should scan only classes in <packageInclude> right? or does it look in upper level? I have two nqueens domains and when I specify <packageInclude>org.jboss.qa.brms.planner.examples.nqueens</packageInclude> it gives me: {code}java.lang.IllegalStateException: The scanAnnotatedClasses (ScanAnnotatedClassesConfig([org.jboss.qa.brms.planner.examples.nqueens])) found multiple classes ([class org.jboss.qa.brms.planner.examples.nqueens.domain.NQueens, class org.jboss.qa.brms.planner.examples.nqueenscontplanning.domain.NQueens]) with a PlanningSolution annotation. at org.optaplanner.core.config.domain.ScanAnnotatedClassesConfig.loadSolutionClass(ScanAnnotatedClassesConfig.java:81) at org.optaplanner.core.config.domain.ScanAnnotatedClassesConfig.buildSolutionDescriptor(ScanAnnotatedClassesConfig.java:68) at org.optaplanner.core.config.solver.SolverConfig.buildSolutionDescriptor(SolverConfig.java:228) at org.optaplanner.core.config.solver.SolverConfig.buildSolver(SolverConfig.java:179) at org.jboss.qa.brms.planner.agile.AutoDetectSolutionDomainTest.testAutoNQueensDomainDetection(AutoDetectSolutionDomainTest.java:27){code} but "nqueenscontplanning" is different package and has nothing to do with "nqueens" package. If I specify package more strictly: <packageInclude>org.jboss.qa.brms.planner.examples.nqueens.domain</packageInclude> planner works.	1	0	https://issues.jboss.org/browse/PLANNER-343
15926	PLANNER-332	Question: What do we use the checkstyle plugin for? Maybe we can even just remove it? (although I doubt that)	1	1	https://issues.jboss.org/browse/PLANNER-332
15927	PLANNER-328	Is the workaround possible without extending the entire SolverConfig class? If I try to just inject my customScoreDirectorFactory into the XML I get an error saying SolverConfig expects only the scoreDirectorFactory tag there. I've tried modifying the SolverConfig and removing the XStreamAlias from the ScoreDirectorFactoryConfig field. Then aliasing that field to my class manually using stream but it will still only load the ScoreDirectorFactoryConfig class and not my custom one.	1	0	https://issues.jboss.org/browse/PLANNER-328
15928	PLANNER-328	I think I did it according to the instructions. I extended ScoreDirectorFactoryConfig, gave it an alias and put the alias into the XML file instead of scoreDirectorConfig. Is it possible that this is because ScoreDirectorFactoryConfig is not abstract nor an interface? I can post my code(sanitized) to the developer forum post I made here: https://groups.google.com/forum/#!topic/optaplanner-dev/3s-9kvYxP40 if that will help.	0	0	https://issues.jboss.org/browse/PLANNER-328
15929	PLANNER-328	I found the proper way to inject a child class into the configuration: {code:title=OptManager.java|borderStyle=solid} XStreamXmlSolverFactory solverFactory = new XStreamXmlSolverFactory(); solverFactory.aliasAttribute(SolverConfig.class, "scoreDirectorFactoryConfig", "flexScoreDirectorFactory"); solverFactory.alias("flexScoreDirectorFactory", FlexScoreLevelDirectoryFactoryConfig.class); solverFactory.addDefaultImplementation(FlexScoreLevelDirectoryFactoryConfig.class, ScoreDirectorFactoryConfig.class); {code} This does require modifying the existing XStreamXMLSolverFactory class to add aliasAttribute, alias and addDefaultImplementation methods. Can these be added to that class?	0	0	https://issues.jboss.org/browse/PLANNER-328
15930	PLANNER-325	This is a great start guys. A quick suggestion. Is there a way to hide Planner tab for field variables and add it dynamically only if the Entity is selected as Planning Entity ? Also, as an extension, even for the Entity, not keeping the planner tab by default. Perhaps have a checkbox in the top or something, that would enable or hide the tab. Last thing.. "Planner" in the tab is not sure if it is a right verbeage. Not mandatory we should come up with something. But worth thinking about a relevant title for that tab.	1	1	https://issues.jboss.org/browse/PLANNER-325
15931	PLANNER-322	When should solverStarted() be called? Do you require any additional data info besides that it's started? Would do this code cover your requirements? {code} public void run() { solverStarted(); solver.solve(); solverTerminated(); } {code} Reason I ask, is because inside the solver, the internal SolverLifecycleListener.solverStarted() event happens much later, after the initial solution has been scored and cloned. And it's even called multiple times if Solver.addProblemFactChange() is used. Same applies to SolverLifecycleListener.solverEnded().	1	1	https://issues.jboss.org/browse/PLANNER-322
15932	PLANNER-319	I am refactoring our model so that we can use AnchorChain/Inverse and a CustomShadowVar listener (to compute them all), but => PLANNER-252	1	1	https://issues.jboss.org/browse/PLANNER-319
15933	PLANNER-319	The 3th point is a separate issue, presuming it still reproduces: "When the fact-change API changed such a property, we also called before/afterVariableChanged, because we could not call before/afterFactChanged, because the changed field belongs to a planning entity." That should no longer be the case in 6.2.0.Final: before/afterFactChanged() should work on a planning entity to change a problem property of an entity (so without throwing an exception). Can you confirm on deny this with 6.2 or later?	1	1	https://issues.jboss.org/browse/PLANNER-319
15934	PLANNER-317	1) thanks for the idea to split Vehicle/VehicleEntity 2) my idea was to remove the consistence-check in OptaPlanner, so that OptaPlanner does never call the getter of the inverse shadow variable, only the setter then one can annotae the @InverseRelationShadowVariable on the Standstill interface, let the Vehicle stay a fact (no cloning), because only Customer would implement the setter setNextCustomer() properly. The Vehicle just provides a dummy-impl. that ignores the next customer. BTW: what do you mean with externalized model? Could not find this term in the manual. in 6.0 and 6.2	1	1	https://issues.jboss.org/browse/PLANNER-317
15935	PLANNER-315	Can the (B) annotated like bellow? Proposal D) {code} @CustomShadowVariable(source = {fire}, listener = FireToLavaAndSmoke.class) Lava lava; @CustomShadowVariable(source = {lava}) Smoke smoke; {code} If so, this looks simple. it defines smoke as a shadow variable and dependent to lava but no listener for this update.	1	1	https://issues.jboss.org/browse/PLANNER-315
15936	PLANNER-315	Just thinking about backwards compatibility. will we change it with words we are fixing a bug? because if not, there will be always way to implement bugged domain	1	1	https://issues.jboss.org/browse/PLANNER-315
15937	PLANNER-309	Increasing the limit as time passes is a good idea. It's similar to increasing the acceptedCountLimit for Tabu Search as time passes. And it's a bit similar to reheating of LA and SA. The problem is: at what event do we decide to increase such a limit? Do we hardcode a function against time or number of steps? Or do we go with something potentially smarter (also potentially worse) such as flat line detection etc. The trigger must definitely be pluggable, so follow a Strategy design pattern, so we can implement all these and do benchmarks to figure out the best config.	0	0	https://issues.jboss.org/browse/PLANNER-309
15938	PLANNER-282	Everything done! Nearly ;) What exact do you mean with: Adjust the kie-uber-distribution accordingly ?	1	1	https://issues.jboss.org/browse/PLANNER-282
15939	PLANNER-275	With some minor changes, ACC is improved to 670. I confirmed that ACC keeps the same with larger data set (e.g. instance05) while EasyJave gets slower. Sent a PR: https://github.com/droolsjbpm/optaplanner/pull/71 Cheers,	1	1	https://issues.jboss.org/browse/PLANNER-275
15940	PLANNER-255	Thanks for reporting. Which is the useless screenshot?	1	0	https://issues.jboss.org/browse/PLANNER-255
15941	PLANNER-255	Are you sure you're getting the exact same stacktrace? Your issue sounds like an entirely different issue to me (in which case, please open a new jira issue (and link this one)).	1	0	https://issues.jboss.org/browse/PLANNER-255

#	Requirement	Questions	Answered	Successfully Answered	URL
15942	PLANNER-255	This an upstream JDK issue, only for Mac. Can you submit a new issue in the mac port? https://java.net/jira/browse/MACOSX_PORT It looks like Mac JDK 1.7.0_71 again exposes this problem that was fixed in earlier release: https://java.net/jira/browse/MACOSX_PORT-774	0	0	https://issues.jboss.org/browse/PLANNER-255
15943	PLANNER-253	Should the J in Kjar be a capital?	1	1	https://issues.jboss.org/browse/PLANNER-253
15944	PLANNER-253	Wrt. "J" in "Kjar" - that depends... what does Drools use? Have they standardized? Is "Kjar" even the proper full name, or is it "Kie Jar", "Knowledge Jar" or whatever? +1 on "scoreKjarFile" and "scoreKjarGav". Cannot see the use for "scoreKBaseId".	1	1	https://issues.jboss.org/browse/PLANNER-253
15945	PLANNER-249	Isn't this implemented already? See doc section "4.3.5.2.3. ValueRangeProvider on the planning entity" http://docs.jboss.org/drools/release/latest/optaplanner-docs/html_single/index.html If it doesn't work for a specific case, pls update the title of this issue to reflect that.	0	0	https://issues.jboss.org/browse/PLANNER-249
15946	PLANNER-249	Wouldn't filters on moves/selectors do something very similar? You still have to evaluate the filters, so there is some overhead, but the overhead of filters can be kept pretty low... http://docs.jboss.org/drools/release/6.1.0.CR1/optaplanner-docs/html_single/index.html#filteredSelection	0	0	https://issues.jboss.org/browse/PLANNER-249
15947	PLANNER-245	Can we restrict this to optaplanner-benchmarker? Basically add a ProblemStatistic that registers listeners in optaplanner-core to find this stuff out and report it. I don't want to keep track of these statistics by default in any optaplanner-core run. That will slow things down. But I might want to keep track of them, if one of the metaheuristics demands them (similarly to constraintMatchEnabled)	1	1	https://issues.jboss.org/browse/PLANNER-245
15948	PLANNER-239	I stlll have the same problem described in this issue. Will that be implemented in 6.3?	1	1	https://issues.jboss.org/browse/PLANNER-239
15949	PLANNER-235	Martin, can you check these requirements? Requirements: - All terminations (except for terminateEarly) should put the Solver in the wait() state. The solve() method should not return. - terminateEarly() should not put the Solver in the wait() state and it should get it out of it if it's in it. The solve() method should return. So terminateEarly() is effectively the only way to kill the deamon properly. - If a problemFactChange is added, the Solver must get out of the wait state() - and should not re-enter it before all problemFactChanges are done and the solver has run (every time there are new). - If the Solver starts with no planning entities, it will naturally terminate quickly, then it should go into the wait() state: to wait for problemFactChange that add entities.	1	1	https://issues.jboss.org/browse/PLANNER-235
15950	PLANNER-220	Maybe the following bug could be related to this feature: The logarithmic scaling does not work if the problemScale is ambiguous and therefore set to -1L in ProblemBenchmarkResult.class. While creating a chart having problems with ambiguous scale JfreeChart is throwing a Runtime Exception: {quote} java.lang.RuntimeException: Values less than or equal to zero not allowed with logarithmic axis at org.jfree.chart.axis.LogarithmicAxis.autoAdjustRange(LogarithmicAxis.java:530) at org.jfree.chart.axis.NumberAxis.configure(NumberAxis.java:415) at org.jfree.chart.plot.XYPlot.configureDomainAxes(XYPlot.java:974) at org.jfree.chart.plot.XYPlot.datasetChanged(XYPlot.java:4539) at org.jfree.chart.plot.XYPlot.setDataset(XYPlot.java:1396) at org.optaplanner.benchmark.impl.report.BenchmarkReport.createScalabilityPlot(BenchmarkReport.java:527) at org.optaplanner.benchmark.impl.report.BenchmarkReport.writeBestScoreScalabilitySummaryChart(BenchmarkReport.java:302) at org.optaplanner.benchmark.impl.report.BenchmarkReport.writeReport(BenchmarkReport.java:202) at org.optaplanner.benchmark.impl.PlannerBenchmarkRunner.benchmarkingEnded(PlannerBenchmarkRunner.java:197) at org.optaplanner.benchmark.impl.PlannerBenchmarkRunner.benchmark(PlannerBenchmarkRunner.java:89) at de.akquinet.jbosscc.energyplanner.planner.runtime.benchmark.PlannerBenchmarkTest.testDifferentLocalSearchParametersMoreStatistics(PlannerBenchmarkTest.java:63) at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method) at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:57) at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:43) at org.junit.runners.model.FrameworkMethod$1.runReflectiveCall(FrameworkMethod.java:47) at org.junit.internal.runners.model.ReflectiveCallable.run(ReflectiveCallable.java:12) at org.junit.runners.model.FrameworkMethod.invokeExplosively(FrameworkMethod.java:44) at org.junit.internal.runners.statements.InvokeMethod.evaluate(InvokeMethod.java:17) at org.junit.internal.runners.statements.FailOnTimeout$StatementThread.run(FailOnTimeout.java:74) {quote} Didnt find a way to disable logarithmic scaling via config, is there one?	1	1	https://issues.jboss.org/browse/PLANNER-220
15951	PLANNER-215	Does this solve the problem? http://docs.jboss.org/drools/release/latest/optaplanner-docs/html_single/index.html#reusingTheScoreCalculationOutsideTheSolver {code}for (ConstraintMatchTotal constraintMatchTotal : guiScoreDirector.getConstraintMatchTotals()) { String constraintName = constraintMatchTotal.getConstraintName(); Number weightTotal = constraintMatchTotal.getWeightTotalAsNumber(); for (ConstraintMatch constraintMatch : constraintMatchTotal.getConstraintMatchSet()) { List<Object> justificationList = constraintMatch.getJustificationList(); Number weight = constraintMatch.getWeightAsNumber(); ... } } {code}	0	0	https://issues.jboss.org/browse/PLANNER-215
15952	PLANNER-211	How to implement? See http://cs.stackexchange.com/questions/18467/non-uniform-random-distribution-how-do-i-get-a-random-between-100-and-180-that http://stackoverflow.com/questions/5314323/generate-a-random-number-with-max-min-and-meanaverage-in-java/6296366#6296366 http://commons.apache.org/proper/commons-math/javadocs/api-3.2/index.html	0	0	https://issues.jboss.org/browse/PLANNER-211
15953	PLANNER-210	I'm also interested in getting this issue fixed. Is there any work going on? If a create a PR on GH... will it get merged? Thanks a lot.	0	0	https://issues.jboss.org/browse/PLANNER-210
15954	PLANNER-210	Normally PR's are very welcome :) But because Random is about everywhere, it's a simple replace and I am currently planning to fix it next week, no need to bother. Feel free to spec out how you thing the solverconfig xml should look like if you want to switch to another random impl. How about? {code} <solver> <randomType>WELL_1024_A</> </solver> {code}	1	1	https://issues.jboss.org/browse/PLANNER-210
15955	PLANNER-210	Quick suggestion - can we, instead of <randomType>SOME_CONSTANT</randomType> let people provide an actual class name? That way, people can plug in whatever they like. (Should also help with debugging and testing.)	1	1	https://issues.jboss.org/browse/PLANNER-210
15956	PLANNER-210	Good point. Agreed that we want to support that scenario. Let's brainstorm about the solutions proposals on IRC?	1	1	https://issues.jboss.org/browse/PLANNER-210
15957	PLANNER-204	At what logging level do you want this? DEBUG or TRACE? -1 to do at logging level ERROR, WARN and even INFO: too much verbosity. DEBUG seems most appropriate?	0	0	https://issues.jboss.org/browse/PLANNER-204
15958	PLANNER-204	When do we output it? A) when the solver factory is created B) every time a solver is created	0	0	https://issues.jboss.org/browse/PLANNER-204

#	Requirement	Questions	Answered	Successfully Answered	URL
15959	PLANNER-202	Naming dilemma: Suppose we selected a capital near Brussels (so Paris, Amsterdam, London, etc). How do we call "Brussels"? A) Reference B) Original C) Origin D) Center E) ...	1	1	https://issues.jboss.org/browse/PLANNER-202
15960	PLANNER-194	Is this issue dead? We're cleaning up jira. If there's no activity on this issue in the next 3 months, I am going to reject it (based on my comment above).	0	0	https://issues.jboss.org/browse/PLANNER-194
15961	PLANNER-189	Hi Reinis. Interesting request :) I do have some concerns/doubts... A) I am not familiar with rule.getMetaData(). What kind of information does rule.getMetaData() gives us that we don't have already? Got some practical examples? Note that this info is already available: - ConstraintMatchTotal.constraintPackage is the DRL package - ConstraintMatchTotal.constraintName is the rule name - ConstraintMatch.justificationList is the list of causes that caused the rule to fire. My concerns/doubts: 1) I am mainly worried about bloating the ConstraintMatch or ConstraintMatchTotal objects. In the future, some algo's might store them in memory to make heuristic decisions based on the matches of previous steps. For example: prefer moves that resolve a ConstraintMatch which has been broken for all previous steps - even if they are worse that moves that don't resolve it. 2) I am also worried about the fact that the ConstraintMatchTotal objects outlive the RHS (they stick into ScoreHolder so the GUI can show them for example when you click on "Constraint Match".) Looks like rule.getMetaData() wraps an internal drools Map to make it unmodifiable for us. But what if drools itself modifies it later - could it "change" under our feet?	1	1	https://issues.jboss.org/browse/PLANNER-189
15962	PLANNER-189	Here's what getMetaData() does: http://docs.jboss.org/drools/release/6.0.0.CR3/drools-expert-docs/html_single/index.html#d0e4780 Basically I can declare some user-defined key-value pairs for some or all rules. Here are my scenarios: - after the planning I want to extract only "relevant" rules from ConstraintMatch collection (for instance only such I want to log or report to user if they're violated). This way I have my very own rule categorization; - eventually I want to group rules, because there are use cases where multiple drools rules map to one "logical" rule. Or to generalize, my intent is to be able to have my own taxonomy for rules in addition to package. Regarding your concerns - surely I can solve this differently (e.g. by grouping rules into packages) I wasn't simply aware of any implications. Also, according to what you write on ConstraintMatch design - aren't they intended to be generated AFTER planing by means of creating ScoreDirector and passing planning result to it so that it creates all the ConstraintMatch information? (am mentioning this because that way your concerns would have less relevance :)) On the other hand I do think I will need a continous planning very soon and in this case there is no "AFTER planing". Is it possible mebbe to discuss this a bit with drools guys to clarify what implications could there be? Another thought - rule meta data as its name implies is rather static information (similar to package or const name) and is unlikely to change (see also this drools link for the examples) because it is intended to enrich rule definition with some meta.	1	0	https://issues.jboss.org/browse/PLANNER-189
15963	PLANNER-167	Is this issue planned to be fixed in the near future? When not, how much work is it to add this feature?	1	0	https://issues.jboss.org/browse/PLANNER-167
15964	PLANNER-167	How would it behave? What are the use cases? Without those questions answered, this issue isn't defined well enough yet to consider starting implementation.	1	1	https://issues.jboss.org/browse/PLANNER-167
15965	PLANNER-167	*What are the use cases?* See attached image (simple use case). Each _Scheduling_ has an _Order_. The _Order_ has a _Runtime_. This _Runtime_ needs to be scheduled by one _Machine_ successively. Each day the _Machine_ has another capacity which is the _MachineCapacity_, sometimes the _MachineCapacity_ for a day is null --> e.g. on Saturday or Sunday. So depending on the optimized ("selected") days the number of days from the _Scheduling_ differs --> a _List<MachineCapacity>_ is needed. _@PlanningSolution: Solution_ ... returns a list of _Schedules_ (_@PlanningEntityCollectionProperty_) _@PlanningEnity: Scheduling_ ... has an _Order_ and a list of scheduled _MachineCapacities_ (_@PlanningVariable_) The number of _Schedules_ are equal to the number of _Orders_. *How would it behave?* Each optimization step the _Optimizer_ takes, depending on the selected algorithm, a number of _MachineCapacities_ and schedules this _MachineCapacities_ to the different _Schedules_. When each _Scheduling_ has enough _MachineCapacity_ (on the same Machine successively) to finish the scheduled _Order_ the _ScoreCalculator_ returns the hard constraints value 0. It is also necessary that a _Machine_ has only one _Scheduling_ at a specific moment.	1	0	https://issues.jboss.org/browse/PLANNER-167
15966	PLANNER-167	I changed the design so that I need a shadow variable, which is used for calculating the _EndDate_. This _EndDate_ is also used for the score calculation. I think it is no good design to use a shadow variable for calculating the score. But otherwise it would not be possible to solve this problem. Do you think it is good practice to use a shadow variable for calculating the score? I need to know the _EndDate_ because so I can check if another _Order_ is scheduled at the same date/time.	0	0	https://issues.jboss.org/browse/PLANNER-167
15967	PLANNER-110	Hi Michal, Are you sure this applies to drools-planner? If it's specifically aimed at the score rule calculation done by the RETE rule engine, the component should be drools-expert. If it's about how the drools-planner moves/steps should be optimized, then drools-planner is the correct component.	1	1	https://issues.jboss.org/browse/PLANNER-110
15968	PLANNER-103	approximately when will be resolved? :)	1	1	https://issues.jboss.org/browse/PLANNER-103
15969	PLANNER-100	The interface FeasibilityScore now exists, this termination can expect that that such a Score is being used. The other Terminations now have Tests (so it's better to copy one of those tests). The only open analyse question is how do we specify it in the TerminationConfig? My proposal of <hardAndSoftScoreFeasible> is outdated, especially now that we have the interface FeasibilityScore which is implemented by BendableScore and HardMediumSoftScore too.	1	1	https://issues.jboss.org/browse/PLANNER-100
15970	PLANNER-99	Why am I not able to assign this to myself? There's no such button anywhere.	1	1	https://issues.jboss.org/browse/PLANNER-99
15971	PLANNER-99	Click on the button assign and then in the dialog, assign to me?	1	1	https://issues.jboss.org/browse/PLANNER-99
15972	PLANNER-96	Copied from the change: Hi David, Thanks for sharing this change. Even though I don't want to change the BestSolutionEvent API like this (as it leaks the solver's "working" WorkingMemory), it does give me a very good insight on what you want to do. Furthermore, I 've recently specced out that the user provides a bestSolution and the workingMemory is a clone of that. So that means the bestSolution is never in the WorkingMemory. See the changes here: https://github.com/droolsjbpm/drools-planner/commit/5690541a567e5db36c6f2f5a66fda4f9c99d4086#diff-6 Next improvement in this will be to split up the SolutionDirector into SolutionDirectorFactory (holds RuleBase) and SolutionDirector (holds WorkingMemory) so the user can use the same SolutionDirectorFactory to create it's own, isolated SolutionDirector. That would mean you'd have to take the bestSolution and set it on your SolutionDirector (instead of sharing a WorkingMemory with the Solver). Can you live with that? It might be a small performance hit (but premature optimization is the root of all evil because not doing it would hinder multi-threaded solving in the future).	0	0	https://issues.jboss.org/browse/PLANNER-96

#	Requirement	Questions	Answered	Successfully Answered	URL
15973	PLANNER-94	For another issue, it should be possible to set the RuleBase instead of supplying the DRL references. Would that solve this issue? Maybe not because a service needs to be set on the WM, not the RuleBase which creates the WM. Update: It would not solve this issue because setting it on the rulebase doesn't work, because global variables need to be set on the WorkingMemory instances, not the RuleBase. However, every now and then planner needs to create a new WM (especially once we go multi-threaded/vm), currently only in debug mode I believe, so setting it on an individual WM isn't a good solution. Defining a map of globals to put on any WM that is created, might work.	1	1	https://issues.jboss.org/browse/PLANNER-94
15974	PLANNER-94	@Henrik That scenario makes sense. Here's solution proposal A: DroolsScoreDirectorFactory gets a Map<String, Object> globalVariablesToInjectMap for every entry in that map, DroolsScoreDirector injects them (key = global variable name, value = instance to inject) when creating a new working memory. ScoreDirectorFactoryConfig gets a Map<String, Object> droolsGlobalVariablesToInjectMap. Database connections in XML won't work well (because the connection will never get closed), so the use of droolsGlobalVariablesToInjectMap would call for the use of API configuration (see manual), which is fine. Chapter-Score_calculation.xml should document how to use it, preferably with a connection based example. It should clearly state that all global variables must be thread-safe. Open questions: Is the thead-safe requirement doable? In some cases they might need to hack it with ThreadLocals. Currently this is not a priority for me, but pull requests are welcome :)	1	1	https://issues.jboss.org/browse/PLANNER-94
15975	PLANNER-94	Thanks for a quick reply! I'll see what I can do. Proposal A is probably more reasonable, I can't see a reason for exposing the rest of WorkingMemory? I read through the stuff you mentioned, and this seems straightforward. Regarding thread safety: Should the globals possibly implement some interface to allow them to be notified when the solver session starts / ends? This could allow the globals to handle thread specific db-connection lifecycle stuff.	1	1	https://issues.jboss.org/browse/PLANNER-94
15976	PLANNER-94	Solution proposal D: Notifying the globals at the beginning and ending of workingMemory creation (not solve()) I don't prefer this proposal, because it requires the global instances to implement a custom interface, so you can't reuse JDCB's datasource directly etc. Solution proposal E: Notify a WorkingMemoryManager interface from DroolsScoreDirectorFactory every time a WM is created or destroyed. This is basically proposal B. I think I prefer this one. How to do proposal E: DroolsScoreDirector must delegate WM creation and destruction to DroolsScoreDirectorFactory DroolsScoreDirectorFactory can have a WorkingMemoryManager instance. Upon WM creation and destruction, DroolsScoreDirectorFactory calls WorkingMemoryManager. This gives WorkingMemoryManager an opportunity to add globals (and whatnot) to the WM during creation and cleanup during destruction.	1	1	https://issues.jboss.org/browse/PLANNER-94
15977	PLANNER-92	How does this relate to phasing? Phasing is the process where you run 10 minutes tabu search, 10 minutes simulated annealing, 10 minutes great deluge, 10 minutes tabu search, ... sequentially after one another on the same problem continue-ing on the results of the previous solver.	0	0	https://issues.jboss.org/browse/PLANNER-92
15978	PLANNER-83	Does branch and bound work with positive weighted constraints? Or only with strictly negative weighted constraints (= most use cases)? If not, we need a brute force solver too, for the use cases that use postive weighted constraints	0	0	https://issues.jboss.org/browse/PLANNER-83
15979	PLANNER-76	It's the homogeneous moves (as Java Currency in practice teaches us) that need to be spread on multiple threads. * One step thread (the thread which called solve()) ** Starting solution is created on the step thread (later we'll see if we can do multithreading support there too) ** It has a workingSolution (which is does already) ** multithreading starts from decideNextStep * N move threads ** Typically N = the number of CPU's (minus 1?) *** NOT the number of selected moves! ** Each has a work queue of Moves (= 1/N th of the selected moves) *** The stepThreads creates the Moves and distributes them among the moveThread workQueues. (A) *** The moveThreads can steal from the end of each other => work stealing queues **** probably use Java 6 implementations **DO NOT BREAK DELTA BASED SCORE CALCULATION!!! (See latest ref manual to understand why not!) *** Each moveThread has it's own workingSolution in a ThreadLocal *** A move from the workQueue of which the score and acceptChance needs to be calculated is done and undone on the moveThread's workingMemory. *** The stepMove (= winning move) is applied to the stepThread's workingSolution as well as on every moveThread's working solution **** So it needs to be cloned? ***** And applied on several solutions (B) (A) and (B) have problem to which I know no best answer at the moment: A Move holds a reference to an instance (for example Exam) of the stepThread's workingSolution (for example Examination). But when given to a moveThread it should execute on the instance of the moveThread's workingSolution, which is a different instance(actually a clone of the original Exam, but a different instance).	0	0	https://issues.jboss.org/browse/PLANNER-76
15980	PLANNER-63	Good idea. I often kill the Benchmarker process when I want all CPU resources available for my IDE, losing hours of benchmarking CPU time. Some things to pounder about: - Any solution for this issue and JBRULES-3477 will involve serializing benchmark results (including statistics) to disk. - best solution changed statistics data is now kept in memory for every solver for every file. Only at the end the graphs and csv's are made. Is this asking for a OOM for some future use cases? (yes) - Are the benchmarks being done in the correct order? Currently: per solver, then per file. If it's the other way around: per file, then per solver, we can output best solution changed statistics graphs sooner (and release that memory!) - "A new API is added to Planner that allows to resume the benchmark from the above intermediate file." I doubt the usability of this exact way. We can make it work automatically, like "<resumeFromLastIfThatIsUnfinished>true</>" (over-ridable by system property): -- Planner knows what the last benchmark in the benchmarkDirectory, because the benchmarks are in timestamped subdirs -- Problem is what if the benchmark config has changed meanwhile? We need some way to detect if any of the benchmarks already run are the exactly the same. But what if the drools-core jar or planner jar or any of the classes have been updated? Does it count as being the same benchmark? -- resumeFromLastIfThatIsUnfinished must be overridable by a system property, so you can just configure a run config that way without having to change the xml every time to enable/disable it.	1	1	https://issues.jboss.org/browse/PLANNER-63
15981	PLANNER-60	Could someone please add a brief note about this in the docs? I think the workaround is quite acceptable, but the docs are very misleading because they say "If null is a valid planning value, it should be included in the value range and the default way to detect uninitialized planning variables must be changed." (http://docs.jboss.org/drools/release/5.4.0.Beta2/drools-planner-docs/html/ch03.html)	1	1	https://issues.jboss.org/browse/PLANNER-60
15982	PLANNER-57	Could you comment an example of a use case that would benefit for global injection? I'd like to understand the real use cases for this to implement/test it better. If we reuse the same instance for all the threads, then that global instance needs to be thread-safe, is suspect to congestion and clustering will fail outright. (Note: multi-threading and clustering are design atm, not implementation.) So I 'd rather see a factory for such a global instance, but that means the global cannot output data after the Solver is done. Is that a problem?	1	1	https://issues.jboss.org/browse/PLANNER-57

#	Requirement	Questions	Answered	Successfully Answered	URL
15983	PLANNER-57	So an example is constraint costs. I'm looking at this for scheduling field workers, both what work, and what order, over a large amount of work and workers. For some sorts of work, being late is very expensive (for example where they are meeting a member of the public, and by law they have to be on time or there are financial penalties), where as for others the primary factor is travel time (when there are number of small pieces of work to do and travel costs dominate). These scaling factors between the different constraints need to be adjustable between runs, because they need to be adjustable per business area. As we discussed on IRC, these could be done by inserting facts, but that is going to slow and verbose for constantly looking them up as part of the rules. Make sense ?	1	1	https://issues.jboss.org/browse/PLANNER-57
15984	PLANNER-56	How to test this stuff: X) Run NurseRosteringBenchmarkApp with the program argument "sprint". This will take a few seconds => great for round-tripping during development. Y) Run CloudBalancingBenchmarkApp. This will take minutes or hours. It has numbers above 64k. Z) Run GeneralOptaPlannerBenchmarkApp. This will take an hour. This is a special corner case and might fail where others won't. W) Run another *BenchmarkApp. Play with <termination> in the *BenchmarkConfig.xml files to reduce round-trip time.	0	0	https://issues.jboss.org/browse/PLANNER-56
15985	PLANNER-54	IncrementalScoreDirector possibly suffers from this too. And CustomPhaseCommands in the mix, might this even more unreliable. Do we really want to support Solver caching? In hyperheuristics, I believe there will be only 1 phase too, so there it's irrelevant. In multi-phase setups (like packing santa's sleigh) and partitioning (divide and conquer, mapReduce) cases, it might be useful though.	0	0	https://issues.jboss.org/browse/PLANNER-54
15986	PLANNER-45	Is this issue even valid? I don't think drools recompiles the DRL every time. Note that multiple Solvers share the same KieBase if they come from the same SolverFactory.	0	0	https://issues.jboss.org/browse/PLANNER-45
15987	PLANNER-42	@Marcin Sounds like a bug in or misuse of Xstream. What happens if you comment out "xStream.setMode(XStream.ID_REFERENCES);" ?	1	1	https://issues.jboss.org/browse/PLANNER-42
15988	OVERLORD-134	Alright, unless you think otherwise, I think the layout is mostly there. Have at it!	0	0	https://issues.jboss.org/browse/OVERLORD-134
15989	PERFREPO-244	[~manovotn] Could you revisit, if this is still not possible? Test execution search via REST API is already implemented, editing test execution (also with values) was also implemented a few days ago, could you please try it? :)	1	1	https://issues.jboss.org/browse/PERFREPO-244
15990	PERFREPO-220	Hi [~manovotn], thanks for the information. Can I ask, how far did you get? This issue will probably be very important for us, since it's a blocker of https://issues.jboss.org/browse/PERFREPO-235 . Do you have any update on this?	1	1	https://issues.jboss.org/browse/PERFREPO-220
15991	PERFREPO-192	Hi Vojtech, thanks for the issue, the README should be updated. The master branch is development branch and the next release of the PerfRepo will require java 1.8 and EAP 6.4. It seems that you run maven with java 1.7. Try jdk 1.8. The WildFly is not supported, so there can be some issues. If it is possible try EAP 6.4	0	0	https://issues.jboss.org/browse/PERFREPO-192
15992	PERFREPO-192	[~vprusa] Thanks for reporting this issue! :) This should be definitely caused by running it on Java 7. Could you please verify that the issue was solved by upgrading to Java 8, so I could update the README file? Please feel free to report any other misunderstanding in README file.	1	1	https://issues.jboss.org/browse/PERFREPO-192
15993	PERFREPO-170	Adding the links is great and thank you! The second bullet is about the text included in the email. Here's an example from a recent email: {noformat} some of the alerts conditions failed. Alerts that failed: Alert name: Library mode Radargun WritesOnly/sec REPL TX improvement {noformat} It would help if the line with "Alert name:" included some more detail about the failure like: {noformat} some of the alerts conditions failed. Alerts that failed: Alert name: Library mode Radargun WritesOnly/sec REPL TX improvement. "ResponseTime was more than 10% different than last run" or "Expected result of x, but got y" {noformat} Sort of like the messages that our logged from a unit test assert failure? Not sure if this is possible, but I wanted to ask!	1	1	https://issues.jboss.org/browse/PERFREPO-170
15994	PERFREPO-170	This is definitely possible. Every alert has an "description" field (hehe, Field...) on it where I can describe, what that alert is guarding. I was thinking about adding it to the email, my only concern is that the mail could get long. Options: * directly include the description in the email * (currently implemented) the alert name is a link to special page in PerfRepo, where there is showed all information about the alert (condition, description, tags, link, etc - everything) Which one would you prefer (or maybe both)?	1	1	https://issues.jboss.org/browse/PERFREPO-170
15995	PERFREPO-153	Purposed library to use (demo): http://www.amcharts.com/demos/candlestick-chart/ It's pretty nice, allows to display as many values as needed, great zooming capabilities, etc. Would this suite your needs? [~jhladky] [~olichtne]	1	1	https://issues.jboss.org/browse/PERFREPO-153
15996	SECURITY-947	What version of WildFly / JDK?	1	0	https://issues.jboss.org/browse/SECURITY-947
15997	SECURITY-947	HI, in fact to be more clear, the problem is this exception : "LDAP: error code 4 - Sizelimit Exceeded" because MaxPageSize is setted in AD to 500 and sometimes we have more than 1000 groups, furthermore in the org.jboss.security there is i think 2 ways to configure it (tested the first not second) : in LdapExtModule.java (i recreate it and override it) : i add thos lines : first the variable : private static final String MAX_PAGE_SIZE = "maxPageSize"; then the code : /** * if there is more than 1000 groups in AD */ protected int maxPageSize = 500; String maxPSize = (String) options.get(MAX_PAGE_SIZE); if (maxPSize != null) { try { maxPageSize = Integer.parseInt(maxPSize); } catch (NumberFormatException e) { PicketBoxLogger.LOGGER.debugFailureToParseNumberProperty(MAX_PAGE_SIZE, this.maxPageSize); } } //set a maxPagesize ctx.setRequestControls(new Control[]{ new PagedResultsControl(maxPageSize, Control.CRITICAL) }); and in logging module you can add this configuration : <module-option name="maxPageSize" value="1000"/> i think it should be available directly in JBOSS classes Second solution, in same class : // Query for roles matching the role filter SearchControls constraints = new SearchControls(); constraints.setSearchScope(searchScope); constraints.setTimeLimit(searchTimeLimit); add this line (but i am not sure if it is working) constraints.setCountLimit(3500); i make a workaround with the first solution but a had to redeclare SecuritYActions.java and Decode.java because protected classes regards	0	0	https://issues.jboss.org/browse/SECURITY-947
15998	SECURITY-799	Patched NegotiationAuthenticator.java from 2.3.0.Final with SECURITY-793 changes. Works fine in Chrome and Firefox. In Internet Explorer it acts strange. When I open application, IE displays basic auth username/password prompt where I can put whatever I want (it does not matter) and just after it displays login form or basic auth window (depending on web.xml configuration) again which can finally be used to log in. Why is IE acting so strange?	1	1	https://issues.jboss.org/browse/SECURITY-799
15999	SECURITY-784	During fixing, could you also consider following points? * custom {{INITIAL_CONTEXT_FACTORY}} loaded from another module * fix the behavior in another LDAP login modules too (both PicketBox and JBoss Negotiation)	0	0	https://issues.jboss.org/browse/SECURITY-784
16000	SECURITY-784	Do we have any workaround while waiting the fix?	1	1	https://issues.jboss.org/browse/SECURITY-784
16001	SECURITY-784	Do we have any plan complete the fix for java 7?	1	1	https://issues.jboss.org/browse/SECURITY-784
16002	SECURITY-783	Peter, can you please take a look into Derek's patch?	1	0	https://issues.jboss.org/browse/SECURITY-783
16003	SECURITY-774	Peter, could you review and commit the attached patch please? Thanks.	1	1	https://issues.jboss.org/browse/SECURITY-774

#	Requirement	Questions	Answered	Successfully Answered	URL
16004	SECURITY-773	Peter, could you commit the attached patch please? Thanks.	1	1	https://issues.jboss.org/browse/SECURITY-773
16005	SECURITY-770	I don't have commit permissions to the svn repository. Peter, could you commit it please?	0	0	https://issues.jboss.org/browse/SECURITY-770
16006	SECURITY-761	Darran Lofthouse <darran.lofthouse@redhat.com> made a comment on [bug 1017974|https://bugzilla.redhat.com/show_bug.cgi?id=1017974] This issue has never attempted to address referrals. - Did mapping referrals work before this fix? - Did mapping referrals work before the fix that caused the regression that is fixed here? This issue is only about fixing the regression.	0	0	https://issues.jboss.org/browse/SECURITY-761
16007	SECURITY-761	Josef Cacek <jcacek@redhat.com> made a comment on [bug 1017974|https://bugzilla.redhat.com/show_bug.cgi?id=1017974] Russell, could you please describe the limitation in role search in Release Notes? Thanks.	0	0	https://issues.jboss.org/browse/SECURITY-761
16008	SECURITY-760	sgilda@redhat.com made a comment on [bug 1022679|https://bugzilla.redhat.com/show_bug.cgi?id=1022679] What is the current status of this bug? I'm still getting Jenkins build errors.	0	0	https://issues.jboss.org/browse/SECURITY-760
16009	SECURITY-745	Hi, this problems seems still to be around. I was searching for a replacement for the [GenericHeaderBasedAuthentication|https://developer.jboss.org/wiki/GenericHeaderBasedAuthentication] that works within the Undertow platform. In case there is one please point me to the correct place - I was only able to find tomcat based solutions... We are running Wildfly 9.0.0.Final and I am facing the exact same issue as the one described. Scenario: I wrote an Undertow AuthenticationMechanism that I use in a simple enterprise application with a web module and an ejb module. In the web module I have an secured path configured via web.xml where I expect an authenticated user. I also have included the Undertow Authentication Mechansim which registers correctly. When I access the page, I do get authenticated correcltly via the Undertow Authentication Mechanism and also receive a valid Subject and Principal (with according Roles) in the WebContainer. The servlet then accesses a local EJB which also has role-restrictions applied. Here I receive an authorization error since the Subject is null. The same scenario works just fine when I simply refresh the page and the JSESSIONSSO token is set. Would moving away from the Undertow Authentication Mechanism to a JASPIC Module solve this issue? Any help would be highly appreciated since this is the last thing that keeps us from moving away from WebSphere (there we are using a trust association interceptor (TAI) for header based authentication).	1	0	https://issues.jboss.org/browse/SECURITY-745
16010	SECURITY-744	Stefan - can you verify and incorporate?	0	0	https://issues.jboss.org/browse/SECURITY-744
16011	SECURITY-724	Peter - can you investigate and tell us all the interoperability problems we have here?	0	0	https://issues.jboss.org/browse/SECURITY-724
16012	SECURITY-724	I tried to create vault using 7.2.0-Alpha2 and use it in 7.1.1.Final with long alias and short alias and both working fine. subh aym, can you check it with latest AS7.2, please?	0	0	https://issues.jboss.org/browse/SECURITY-724
16013	SECURITY-671	Have you tried using the standard Kerberos login module in the second domain?	1	1	https://issues.jboss.org/browse/SECURITY-671
16014	SECURITY-671	What do you mean with "standard Kerberos login module"? Do you mean com.sun.security.auth.module.Krb5LoginModule? I can't use this directly in a security domain. Its LoginMethod always returns true, because it only puts the initialized Kerberos Ticket in the Subject as privat credentials. It has to be "surrounded" by JGSS-code. Please take a look at the classes I added to the Support Case. Here the standard Krb5LoginModule is used in combination with the JGSS API. There the Krb5LoginModule created the Kerberos-Ticket from username/passsword. But after this code is called it has to go to your SPNEGOLoginModule.innerLogin() method to accept the generated ticket. That's why I think my extensions should be integrated into the original SPNEGOLoginModule.	1	1	https://issues.jboss.org/browse/SECURITY-671
16015	SECURITY-476	Hi , we ran into similar problem similar problem with domain qualified principals and AdvancedLdapLoginModule while working with JBOSS EAP 4.3 , queries to AD failed since sAMAccountName doesn't include the domain part. We had to add the following code (denoted FIXME in the code snippet below) to findUserDN in org.jboss.security.negotiation.AdvancedLdapLoginModule to strip the DQN from the principals when required. The behavior is similar to "Use domain-qualified user names" available in Websphere global security. protected String findUserDN(LdapContext ctx) throws LoginException { if (baseCtxDN == null) { return getIdentity().getName(); } try { NamingEnumeration results = null; String filterPrincipalNameArg = getIdentity().getName(); // FIXME DOMAIN CUTOFF FIX - START if (isUseDomainQualifiedPrincipal) { // isUseDomainQualifiedPrincipal is a property exposed as a module option default is false Object[] filterArgs = {getIdentity().getName()}; } else { if (filterPrincipalNameArg != null && filterPrincipalNameArg.trim().length() > 0 && filterPrincipalNameArg.contains("@")) { filterPrincipalNameArg = filterPrincipalNameArg.substring(0, filterPrincipalNameArg.indexOf("@")); } Object[] filterArgs = { filterPrincipalNameArg }; } // FIXME DOMAIN CUTOFF - END // FIXME original: Object[] filterArgs = {getIdentity().getName()}; results = ctx.search(baseCtxDN, baseFilter, filterArgs, userSearchControls); if (results.hasMore() == false) { results.close(); throw new LoginException("Search of baseDN(" + baseCtxDN + ") found no matches"); } SearchResult sr = (SearchResult) results.next(); String name = sr.getName(); String userDN = null; if (sr.isRelative() == true) userDN = name + "," + baseCtxDN; else throw new LoginException("Can't follow referal for authentication: " + name); results.close(); results = null; if (log.isTraceEnabled()) { log.trace("findUserDN - " + userDN); } return userDN; } catch (NamingException e) { LoginException le = new LoginException("Unable to find user DN"); le.initCause(e); throw le; } } // FIXME DOMAIN CUTOFF - END // FIXME original: Object[] filterArgs = {getIdentity().getName()}; results = ctx.search(baseCtxDN, baseFilter, filterArgs, userSearchControls); if (results.hasMore() == false) { results.close(); throw new LoginException("Search of baseDN(" + baseCtxDN + ") found no matches"); } SearchResult sr = (SearchResult) results.next(); String name = sr.getName(); String userDN = null; if (sr.isRelative() == true) userDN = name + "," + baseCtxDN; else throw new LoginException("Can't follow referal for authentication: " + name); results.close(); results = null; if (log.isTraceEnabled()) { log.trace("findUserDN - " + userDN); } return userDN; } catch (NamingException e) { LoginException le = new LoginException("Unable to find user DN"); le.initCause(e); throw le; } } Since the Negotiation component was not a part of EAP in version 4.3 we had to implement this code , currently we are migrating to EAP v5 which has Negotiation 2.0.3 SP2/SP3 integrated thus we would like to have this FIX applied in the enterprise version for EAP 5. Thank you.	1	1	https://issues.jboss.org/browse/SECURITY-476
16016	SECURITY-448	Thats good to hear, where can I find details on this, it isnt in the documentation I have found? If this is the case shouldn't this ticket be resolved ?	0	0	https://issues.jboss.org/browse/SECURITY-448
16017	SECURITY-447	This seems like a pretty useful RFE and at some point we do need to start 'certifying' identity stores like MS AD - so this will be a useful enhancement to make that possible. My only concern is the availability of a test environment and the expertise to set it up and maintain it. If QE is comfortable with this then I vote that we commit it for EAP 5.1 as EAP 5.0.2 may be essentially rolled into EAP 5.1.	0	0	https://issues.jboss.org/browse/SECURITY-447
16018	SECURITY-345	Take a look?	0	0	https://issues.jboss.org/browse/SECURITY-345

#	Requirement	Questions	Answered	Successfully Answered	URL
16019	SECURITY-280	Our current implementation allows for more than one stack to be defined. What should getAppConfigurationEntry(String name) return when there are multiple stacks? Just return the first one?	1	1	https://issues.jboss.org/browse/SECURITY-280
16020	SECURITY-270	Darran, I may need to modify the NegociationAuthenticator to handle properly. If my implementation is good enough, I am willing to contribute along with other things. Have you an idea on how you want to do that already? Have you committed anything in the CVS repository or should I start from scratch? Cheers.	1	0	https://issues.jboss.org/browse/SECURITY-270
16021	SECURITY-244	Is this still an issue?	1	1	https://issues.jboss.org/browse/SECURITY-244
16022	SECURITY-242	(01:16:24 PM) marcus: anil: SECURITY-158 (01:16:30 PM) anil: marcus: ? (01:16:34 PM) marcus: anil: credential is not null (01:16:52 PM) marcus: anil: it gets populated in the getUsernameAndPassword method (01:17:39 PM) anil: the question is whether it gets added to the shared map (01:18:28 PM) anil: the thing is the password that was passed via the callback handler needs to be placed in shared map (01:21:02 PM) marcus: it gets added. if PasswordCallback returns anything, the credential is set, so is the password returned from getUsernameAndPassword (01:21:24 PM) marcus: anil: if you add the password to the shared map, you could be adding it hashed (01:21:42 PM) marcus: anil: which i don't think should be the case (01:30:25 PM) anil: marcus: I think the user is correct (01:30:35 PM) anil: see credential is the one that already existed in shared state (01:30:49 PM) anil: so it is either exists (if I am 2nd module) or null (01:31:11 PM) anil: password is what is returned by the handler and the JAAS contract says that that should be the pass that exists in the shared map (01:31:15 PM) anil: can u validate this? (01:41:37 PM) marcus: it is not null because in the getUsernameAndPassword method (called in login()) it is set to the value of the password callback (01:44:13 PM) marcus: the only way the credential is null is if PasswordCallback.getPassword() is null (01:44:31 PM) marcus: anil: i think the user is mistaken (01:44:34 PM) anil: this is why global variables are dangerous (01:45:40 PM) anil: marcus: I think in the end password and credential will contain the same information (01:45:46 PM) anil: right? (01:46:00 PM) anil: because of String pass = info[1] (01:46:01 PM) marcus: no... the password can be hashed if the options are included (01:46:21 PM) marcus: then it would store the hashed version of the password (01:46:43 PM) marcus: and not the plain text, or char[] (01:46:52 PM) marcus: which is the credential (01:48:00 PM) anil: marcus: I think u r correct (01:48:06 PM) anil: marcus: credential is the right password (01:48:11 PM) anil: marcus: that is unchanged (01:48:21 PM) marcus: anil: yes. i believe so (01:49:08 PM) anil: marcus: thanks for the second look. I suspected something fishy here	1	1	https://issues.jboss.org/browse/SECURITY-242
16023	SECURITY-141	Hi Darran, Is this ticket also related to falling back to a lesser WWW-Authenticate mechanism? (e.g. Digest or Basic). I have implemented a solution that refactors the NegotiationAuthenticator allowing the user to configure Basic fallback if they choose. In addition, the solution makes it pretty simple to incorporate Digest fallback as well. Would there be interest in this patch? If needed, I would be happy to create a separate ticket and provide the implementation. Thanks!	1	1	https://issues.jboss.org/browse/SECURITY-141
16024	SECURITY-141	Hi Darran, As you mentioned in your description that this ticket is specific to FORM authentication, I went ahead and created a ticket specific to supporting fallback to BASIC authentication, specifically SECURITY-448. I have attached the patch there so please let me know if you have any feedback. In addition, I think the provided patch could support FORM authentication as well with only a few modifications. I'm probably missing something, but I could only figure out how FORM authentication could address fallback case 1 in the comments. In case 1 the server gets a chance to respond to the user before the browser presents the 401 so we could definitely redirect them to the form instead of sending the 401. Did you have an idea for supporting case 2 with FORM authentication? Thanks again!	1	1	https://issues.jboss.org/browse/SECURITY-141
16025	SECURITY-128	Darran , can you please elaborate more on this one?	0	0	https://issues.jboss.org/browse/SECURITY-128
16026	SECURITY-89	Should we close this?	0	0	https://issues.jboss.org/browse/SECURITY-89
16027	SECURITY-36	Where is the patch? You have not attached it yet. What is the best way to test this?	1	1	https://issues.jboss.org/browse/SECURITY-36
16028	PLINK-747	Can you try adding {{org.picketlink.config}} to your dependencies ?	1	1	https://issues.jboss.org/browse/PLINK-747
16029	PLINK-691	Could not identify what may be happening from your logs. Can you please provide more details about your HA environment ? Also, how your PL configuration looks like ? Thanks. PS.: I'll be looking at that more deeply in April.	0	0	https://issues.jboss.org/browse/PLINK-691
16030	PLINK-683	This has been closed as Won't Fix - is there any plan to support this in future?	0	0	https://issues.jboss.org/browse/PLINK-683
16031	PLINK-652	Hey Mike, can you check it out again ? From upstream ...	1	0	https://issues.jboss.org/browse/PLINK-652
16032	PLINK-637	Which IDE are u using ? I can see the javadocs in Intelij though. And comments are there on each method of [1]. [1] https://github.com/picketlink/picketlink/blob/master/modules/base/api/src/main/java/org/picketlink/config/http/AbstractHttpSecurityBuilder.java	0	0	https://issues.jboss.org/browse/PLINK-637
16033	PLINK-612	Got it. I would suggest to leave this as is for now. We already have a pretty huge RFE backlog :) Are you ok with that ?	1	0	https://issues.jboss.org/browse/PLINK-612
16034	PLINK-575	Hi Ron, From a Apache DS perspective, can we stay with @Secures then ? Is this something missing in Apache DS ? Regards.	1	1	https://issues.jboss.org/browse/PLINK-575
16035	PLINK-571	Hey, That makes a lot of sense. Can you please give more details about your use case ? Maybe writing a quickstart + README or gist with your requirements. Would like to include this in 2.7.0.Beta2. Which should be the last Beta before we start CRs. Thanks.	1	1	https://issues.jboss.org/browse/PLINK-571
16036	PLINK-571	Hey Ron, Can you please test this out using latest SNAPSHOT version ? Best would be if you build upstream/master, 2.7.0-SNAPSHOT. Otherwise you may try to use a SNAPSHOT from JBoss Nexus, which I just deployed containing the necessary changes. In order to define the scope you just need to provide a configuration as follows: {code} public void onInit(@Observes SecurityConfigurationEvent event) { SecurityConfigurationBuilder builder = event.getBuilder(); builder .identity() .scope(WindowScoped.class); } {code} Regards.	1	1	https://issues.jboss.org/browse/PLINK-571
16037	PLINK-548	Can't you do that from a custom AttributeManager ? Maybe we need to pass some more context information when invoking it.	1	1	https://issues.jboss.org/browse/PLINK-548
16038	PLINK-548	Hey Dustin, Any news ? Can we close this issue ?	1	1	https://issues.jboss.org/browse/PLINK-548
16039	PLINK-548	You can close it. Should we need this functionality in the future we will look at writing a custom AttributeManager or engage you again.	1	1	https://issues.jboss.org/browse/PLINK-548
16040	PLINK-542	Have you tried to extend the SAML2EncryptionHandler and use the incoming request (and SAML message. eg: AuthnRequest) to decide whether encryption should be enabled or not ?	1	1	https://issues.jboss.org/browse/PLINK-542
16041	PLINK-535	That is something we've discussed and holding for some time. I think the best solution (but with a little more change) is improve the Query API to support that. Something like: {code} IdentityQuery<User> query = identityManager.createIdentityQuery(User.class); query.setParameter(CREATED_DATE).lessThan(date); query.setParameter(CREATED_DATE).greaterThan(date); query.setParameter(CREATED_DATE).between(date, anotherDate); {code} Or even review this API and provide a more meaningful fluent API. Wdyt ?	0	0	https://issues.jboss.org/browse/PLINK-535

16043	PLINK-440	Did you get this working by annotating methods ? Please, consider the fix for PLINK-443.	1	1	https://issues.jboss.org/browse/PLINK-440
16044	PLINK-439	Last discussion about this issue. ========== Shane Bryzak: i think it's ok if we extend the @AttributeProperty annotation08:05:21 PM Shane Bryzak: so we have @IdentityStereotype(ROLE) on the class08:05:43 PM Shane Bryzak: then @AttributeProperty(stereotypeProperty = ROLE_NAME)08:06:01 PM Shane Bryzak: on the property field or method08:06:09 PM Pedro Igor: I see, actually, I did that after our last discussion ...08:06:32 PM Pedro Igor: but I really don't liked how we specify the property08:06:42 PM Pedro Igor: i think we're complicating ... i single annotation should do the trick ...08:07:00 PM Shane Bryzak: we shouldn't use a string value, it's not typesafe08:07:08 PM Pedro Igor: yeah, i know ..08:07:16 PM Shane Bryzak: and who knows, we might introduce a stereotype in the future for which there are multiple properties required08:07:43 PM Shane Bryzak: so a single annotation wouldn't be future-proof08:07:51 PM Pedro Igor: actually, we just create a new one ... 08:08:11 PM Pedro Igor: but i understand your point ..08:08:17 PM Pedro Igor: and I'm half way to make it working ..08:08:26 PM Pedro Igor: considering that "gaps" that i found and we discussed yesterday ..08:08:46 PM Shane Bryzak: yeah i still don't have an elegant solution for the relationship types...08:09:31 PM Pedro Igor: which is common for whatever solution we define ...08:09:34 PM Pedro Igor: ok08:09:37 PM Shane Bryzak: i see why the idea of interfaces is appealing to you08:09:50 PM Shane Bryzak: actually you know what..08:10:25 PM Pedro Igor: :)08:10:31 PM Shane Bryzak: we could use the stereotypes for the relationship types also08:10:41 PM Shane Bryzak: @RelationshipStereotype(APPLICATION_ROLE)08:10:54 PM Pedro Igor: yeah08:11:11 PM Shane Bryzak: that would solve the gaps issue, and be consistent with the other changes08:11:44 PM Pedro Igor: and also define which property is related with the role ?08:11:46 PM Shane Bryzak: right08:11:53 PM Shane Bryzak: which means i'm no longer happy with using @AttributeProperty...08:12:14 PM Shane Bryzak: hmm maybe we need a new annotation for that08:12:23 PM Pedro Igor: we can use that StereotypeProperty that you suggested in both cases ?08:12:58 PM Shane Bryzak: @RelationshipProperty(stereotype = ROLE)08:13:18 PM Pedro Igor: so we define a big enum with stereotype properties for identity types and relationships ?08:13:20 PM Shane Bryzak: either a single enum or two separate enums08:13:42 PM Shane Bryzak: if two enums, i think we need two annotations08:13:50 PM Shane Bryzak: maybe @StereotypeProperty is ok08:14:05 PM Pedro Igor: yeah08:14:07 PM Shane Bryzak: actually i like @StereotypeProperty, it's abstract enough to make sense 08:14:33 PM Pedro Igor: yeah08:14:37 PM Pedro Igor: so ..08:14:39 PM Shane Bryzak: so perhaps one big enum08:14:47 PM Shane Bryzak: @StereotypeProperty(RELATIONSHIP_ROLE)08:15:03 PM Shane Bryzak: @StereotypeProperty(IDENTITY_LOGIN_NAME) ==========	1	1	https://issues.jboss.org/browse/PLINK-439
16045	PLINK-437	Can you check again ? Sources and javadoc jars should be there.	1	1	https://issues.jboss.org/browse/PLINK-437
16046	PLINK-386	can i get a estimated timeframe on when work on this feature will start?	1	1	https://issues.jboss.org/browse/PLINK-386
16047	PLINK-386	Can you take a look at https://docs.jboss.org/author/display/PLINK/Unsolicited+Responses. This can help you setting up Unsolicited Responses using SAML v2.0. If you want SAML v1.1, the process is pretty much the same.	1	1	https://issues.jboss.org/browse/PLINK-386
16048	PLINK-358	Pedro, I started working on this. When I'm running a WildFly / EAP instance with the picketlink subsystem (the result of WFLY-2733), I can see two subsystems: - {{/subsystem=picketlink-federation}} - {{/subsystem=picketlink-identity-management}} But the code in branch PLINK-358 of the pickelink console [1] still uses the address {{/subsystem=picketlink/...}}. Do we need to update the resource addresses in the picketlink console? [1] https://github.com/picketlink2/picketlink-console/blob/PLINK-358/gui/src/main/java/org/picketlink/as/console/client/shared/subsys/model/Federation.java#L37	1	1	https://issues.jboss.org/browse/PLINK-358
16049	PLINK-349	Do you really need SPFilter ? Can you use the valves ? The reason is that SPFilter is very out dated and the valves (if you are using jbossweb or tomcat) are the best option. Regards.	0	0	https://issues.jboss.org/browse/PLINK-349

#	Requirement	Questions	Answered	Successfully Answered	URL
16050	PLINK-343	Will the enhancement be part of the 2.6.0 release? The picketlink-jetty-common project is not referenced from the parent binding pom https://github.com/picketlink/picketlink-bindings/blob/master/pom.xml#L44 and there are checkstyle errors compiling it due to it not having been refreshed in the last couple of weeks. I am eagerly awaiting a release for this feature so I don't have to use snapshots. Thanks!!!!	0	0	https://issues.jboss.org/browse/PLINK-343
16051	PLINK-327	Hi Pedro, I know you where running some more tests against other JPA implementations like EclipleLink and OpenJPA, based on this ticket. Was there any recent update ?	1	1	https://issues.jboss.org/browse/PLINK-327
16052	PLINK-319	Hi, I've also noticed the BDA issue when debugging the subsystem in WildFly. The behavior is exactly how you described, it works for the first BDA and fails for the second. Can you give us the link to your working EAR app ?	1	1	https://issues.jboss.org/browse/PLINK-319
16053	PLINK-319	Can you please take a look at the latest comments on WFLY-2689 ?	1	1	https://issues.jboss.org/browse/PLINK-319
16054	PLINK-313	can you elaborate as to exactly what version that is? We would really like to be able to use our existing saml auth to integrate with bluejeans.com here at redhat, and this is the primary blocker for that happening!	1	1	https://issues.jboss.org/browse/PLINK-313
16055	PLINK-313	Pedro - We are trying to validate this feature in PL2.5.3beta and are having trouble figuring the exact config syntax. Could you provide an example?	0	0	https://issues.jboss.org/browse/PLINK-313
16056	PLINK-313	Hi Danny, This looks like a bug when parsing the value of the Option. Can you try the patched jar which I've attached ? Thanks.	1	1	https://issues.jboss.org/browse/PLINK-313
16057	PLINK-313	Pedro, thank you for your reply. I deployed the attached .jar file but unfortunately the SAML response still looks the same as it did before. I'm not even sure what it's supposed to look like if both the assertion and complete response are signed. Can you verify that I've deployed the .jar in the correct manner (I posted the steps I took above)? Also, can you let me know which specific log entries would show up if both signatures were present and valid? Are there any other dependancies that I might not be using currently besides picketlink-core, picketlink-federation, and picketlink-jbas?	1	1	https://issues.jboss.org/browse/PLINK-313
16058	PLINK-313	Pedro, thanks. The above instructions were successful in helping me deploy 2.5.3. For this version, is there an RPM so that I can distribute these new .jar files without having to run the picketlink installer? I would rather not have it automatically deploy all the other .jar files or change my directory structure or config files.	1	1	https://issues.jboss.org/browse/PLINK-313
16059	PLINK-287	Hi Lincoln, We've a test case for that in our test suite. I`m not sure why you're not being able to retrieve the email: https://github.com/picketlink/picketlink/blob/master/modules/idm/tests/src/test/java/org/picketlink/test/idm/query/UserQueryTestCase.java#L143 I've also tried using the getResultCount() method and it is working. Can you give us the link to your application sources ? Regards. Pedro Igor	1	1	https://issues.jboss.org/browse/PLINK-287
16060	PLINK-273	Hey [~prabhalar], Can you provide more details about your use case and what exactly do you expect from IdP when sending AJAX request ? I understand that makes more sense a 401 than a redirect when request is an AJAX call. But is that all ?	0	0	https://issues.jboss.org/browse/PLINK-273
16061	PLINK-273	Hi All Was this made configurable? The description says "The request is to have a configuration switch ...".	1	0	https://issues.jboss.org/browse/PLINK-273
16062	PLINK-264	Is this still happening ? What about the solution used for PLINK2-107 ? Can we close this issue ?	0	0	https://issues.jboss.org/browse/PLINK-264
16063	PLINK-263	Is this fixed ?	0	0	https://issues.jboss.org/browse/PLINK-263
16064	PLINK-244	Hi Pedro, AeroGear was already updated to the final release. I know you guys have been working on documentation, but I have one question. Do we really need those entities? https://github.com/pedroigor/aerogear-aerodoc-backend/tree/PLINK-244/src/main/java/org/jboss/aerogear/aerodoc/model/entity	1	1	https://issues.jboss.org/browse/PLINK-244
16065	PLINK-244	Hi Pedro, I was digging into the sources and for some reason BasicModel.getAgent can't retrieve the agent (https://github.com/abstractj/aerogear-aerodoc-backend/tree/debug), I think is because we have a custom entity. How could we properly retrieve it? It will throw NPE on login. Another question, Sebastien mentioned that is necessary to retrieve and set the values again like he did on perfomLogin. Is that true?	1	1	https://issues.jboss.org/browse/PLINK-244
16066	PLINK-204	Hi Matthias, As we discussed, the filter is not re-authenticating the user if he is already authenticated. Even if the credentials were sent again. To avoid such confusion, I'll change the filter's logic to always check for the credentials even if the user is already authenticated. If they're present we always re-authenticate the user. Do you agree ? Thanks. Pedro Igor	1	1	https://issues.jboss.org/browse/PLINK-204
16067	PLINK-202	The following changes have been made: 1) SecurityContext has been renamed IdentityContext, and made an interface 2) DefaultIdentityManager has been renamed ContextualIdentityManager, and now implements the IdentityContext interface This change eliminates the weirdness we had around the 1:1 relationship between IdentityManager and SecurityContext, and also results in having to create one less object per IDM "session".	0	0	https://issues.jboss.org/browse/PLINK-202
16068	PLINK-197	Hi Mathias, Looking at the stack trace I noticed that the root cause is the column size being insufficient to hold the value. Are you using the IdentityObjectAttribute from picketlink-idm-schema ? If so, please try to use your own implementation for this class changing the column "value" length to a higher value. The default schema (pl-idm-schema) is only a sample mapping, you can always provide your own entities.	0	0	https://issues.jboss.org/browse/PLINK-197
16069	PLINK-154	If SCIM 2.0 isn't ready, can this implement SCIM 1.1?	1	0	https://issues.jboss.org/browse/PLINK-154
16070	PLINK-140	Deepali has provided some valuable feedback: "A few comments: Excellent overview in section 1. Version in following sentence needs to be fixed: "PicketLink 3.0 is licensed under the Apache License Version 2," As a developer, when would I use the identity management lib without the base module? This is a question that popped up while reading section 1. It wasn't easy to get to the PL Fed docs from the link, maybe a more specific link would help. E.g. https://docs.jboss.org/author/display/PLINK/PicketLink+Federation Even better would be to include those in the same doc as this one. In section 3.1, overview was helpful. After that, it would be good to understand the power of the library, rather that understand full details of each class and how they relate to each other. I found the snippets in section 3.3.7.1 and 3.3.8.2 to be most illustrative in understanding what I can do with these libs. I wonder if there is an easy way to start with that, or other usage examples and then cover details of the identity model and other details. This is just a thought, take my suggestion with a pinch of salt ;)"	0	0	https://issues.jboss.org/browse/PLINK-140

16071	PLINK-125	Feedback from Burr: 1) Start with an upfront arch diagram that demonstrates how the pieces come together. Where does IDM fit in a typical 3-tier web app arch? 2) What is an Agent? my speed reading did not seem to grok what "Agent" was, it is the returned type for getUser 3) Groups/relationships - I would like to see a more complex example worked in. Here is a potential hierarchy: Sales - North America -- East ---- Northeast ---- Southeast -- West -- Channels -- Federal ---- Defense ---- Civilian - Europe Middle East Africa (EMEA) - Asia Within these groups, you have sub-group level "administrators", those people who can modify permissions and roles. You have individual sales contributors who read/write to their customer's data but only read access to their peer's customer data. You have sales managers for a sub-group. 4) How to handle custom schema - this was part of Seam Security if I remember correctly 5) Forgot password - security questions (what was your high school mascot) 6) Captcha 7) Social login setup/configuration 8) X509 9) Kerboros (Windows/IE integrated login) 10) LDAP and AD integration Section 3.4.4 -what is the name of the default file on disk? That way I can go looking for it, see if it is editable using vi/notepad Section 3.6 - what if the identity provider is read-only? it is fairly common for the LDAP/AD to be read-only from a developers perspective, therefore adding users is harder. In many cases, my user identity is coming from Active Directory but the roles/permissions in a custom store for the application	0	0	https://issues.jboss.org/browse/PLINK-125
16072	PLINK-123	Running this command against the demo, I still get 401: {code:title=request.sh|borderStyle=solid} curl -v -I --user john:123 --digest "http://localhost:8080/aerogear-controller-demo/mycars" {code} The request output: {code:title=output.txt|borderStyle=solid} * About to connect() to localhost port 8080 (#0) * Trying ::1... * Connection refused * Trying 127.0.0.1... * connected * Connected to localhost (127.0.0.1) port 8080 (#0) * Server auth using Digest with user 'john' > HEAD /aerogear-controller-demo/mycars HTTP/1.1 > User-Agent: curl/7.24.0 (x86_64-apple-darwin12.0) libcurl/7.24.0 OpenSSL/0.9.8r zlib/1.2.5 > Host: localhost:8080 > Accept: */* > < HTTP/1.1 401 Unauthorized HTTP/1.1 401 Unauthorized < Server: Apache-Coyote/1.1 Server: Apache-Coyote/1.1 < Set-Cookie: JSESSIONID=FEa9MKlByC-KpFeOrFFecWRR.undefined; Path=/aerogear-controller-demo; HttpOnly Set-Cookie: JSESSIONID=FEa9MKlByC-KpFeOrFFecWRR.undefined; Path=/aerogear-controller-demo; HttpOnly < WWW-Authenticate: Digest realm="default",domain="/aerogear-controller-demo",nonce="MTM2Nzk0NjA2NTE0NDpmMTY2ODkwMC1hMjM3LTQ5ZjItOWYwNS03YTE5YTc4NTU5Mjk=",algorithm=MD5,qop=auth,stale="false" WWW-Authenticate: Digest realm="default",domain="/aerogear-controller-demo",nonce="MTM2Nzk0NjA2NTE0NDpmMTY2ODkwMC1hMjM3LTQ5ZjItOWYwNS03YTE5YTc4NTU5Mjk=",algorithm=MD5,qop=auth,stale="false" < Content-Type: text/html;charset=utf-8 Content-Type: text/html;charset=utf-8 < Content-Length: 958 Content-Length: 958 < Date: Tue, 07 May 2013 17:01:05 GMT Date: Tue, 07 May 2013 17:01:05 GMT < * Connection #0 to host localhost left intact * Issue another request to this URL: 'http://localhost:8080/aerogear-controller-demo/mycars' * Re-using existing connection! 16076	PLINK-95	Adding your chat transcript on #picketlink for people interested on it: [22:24] abstractj (~abstractj@redhat/jboss/abstractj) joined the channel. [22:24] Topic is Only discussion on PicketLink (http://jboss.org/picketlink) [22:24] Set by asaldhan on July 6, 2010 1:59:56 PM GMT-03:00 [22:24] Mode is +cnt [22:53] asaldhan: abstractj: ping [22:53] asaldhan: abstractj: sbryzak: ping [22:53] sbryzak: asaldhan: pong [22:53] abstractj: asaldhan echo reply [22:54] asaldhan: abstractj: shane had some feedback on the session mgmt stuff [22:54] sbryzak: ah yes [22:54] abstractj: cool [22:54] asaldhan: abstractj: did you see the discussion we had 2 hours ago? [22:54] sbryzak: abstractj: could you describe the requirements for PLINK-95 ? [22:54] abstractj: asaldhan not really [22:54] jbossbot: jira [PLINK-95] Add session management support on PicketLink [Open (Unresolved) Feature Request, Blocker, Anil Saldhana] https://issues.jboss.org/browse/PLINK-95 [22:56] abstractj: sbryzak well following the discussions with Pedro this afternoon looks like PicketLink doesn't have session management support (looks like) [22:57] sbryzak: abstractj: are our assumptions about it correct though, that you guys need some kind of token-based solution for stateless apps? [22:58] abstractj: sbryzak token based solution is something quite simple, I did it using custom attributes from the IDM (is not something perfect, but it works) [22:58] abstractj: our concern is about session invalidation, expiration...etc [22:59] sbryzak: abstractj: and http sessions don't provide you with what you need? [23:01] abstractj: sbryzak well, we can work with HTTP sessions only, we just need to know which path to follow. Will picketlink support session management one day? Or we need to implement it ourselves? Or maybe use picketlink extensions? Is just a matter of say the correct path to follow to common web apps [23:02] qmx|away is now known as qmx [23:10] asaldhan: abstractj: if http sessions solves your use cases, you can stick with it. [23:10] asaldhan: abstractj: the web container as you know manages the sessions for you. [23:11] asaldhan: abstractj: DefaultIdentity in PL is session scoped. [23:13] abstractj: asaldhan 'kk so if I want to deal with session timeout, or invalidate some session, the way to go is implement it, correct? I'm checking because I don't want to reinvent the wheel. Will session management be supported on picketlink in the future or this is out of scope? [23:13] sbryzak: abstractj: sorry, had to take a skype call [23:14] asaldhan: abstractj: the http sessions are managed by the container. You can just use the settings for the web container, right? [23:14] sbryzak: abstractj: you know that the Identity bean is session scoped right? [23:14] abstractj: sbryzak relax! is 12 pm! [23:14] abstractj: asaldhan k [23:15] abstractj: sbryzak yup [23:16] sbryzak: abstractj: if you guys have some specific session management requirements, we can take a look at that and assess whether it belongs in picketlink [23:16] abstractj: sbryzak asaldhan so the correct way to go is: use the JBoss + session scoped beans for session management and implement ourselves? I'm double checking it, because I'm do lazy to do stuff that already exists :) [23:16] sbryzak: abstractj: by the way, i'd like to add an example of the typesafe authorization annotations to the aerogear demo if that's ok [23:16] abstractj: sbryzak feel free to do it, anytime [23:17] asaldhan: abstractj: unless you are not using http in any way, then worry about general session management (as in PBox5 and Shiro) [23:17] sbryzak: abstractj: cool.. is there any particular business method that would make sense to secure? [23:18] sbryzak: abstractj: maybe restrict Cars.getCars() to logged in users, or something like that? [23:18] abstractj: sbryzak feel free to change, delete...etc [23:19] abstractj: help is more than welcome [23:20] abstractj: asaldhan 'kk we will handle this, I was just checking because I don't want to duplicate efforts	1	0	https://issues.jboss.org/browse/PLINK-95
16077	PLINK-93	I don't have permission to change the assignee, so there we go. I'm testing the latest changes against https://github.com/abstractj/aerogear-controller-demo/commit/6940cdd084b7fde76f6ff5f4f86c4129e8239a7c And would appreciate if you guys could provide some example of usage with cURL. Currently I'm trying with curl -u "john:123" http://localhost:8080/aerogear-controller-demo/basic/ but not having too much success. Am I doing something wrong?	1	1	https://issues.jboss.org/browse/PLINK-93
16078	PLINK-93	Sorry Pedro, but I'm not following you on it. Could you please elaborate more? This JIRA is related to HTTP BASIC, not DIGEST (http://curl.haxx.se/docs/manpage.html#--digest) I don't have the same behaviour using Node.js.	1	1	https://issues.jboss.org/browse/PLINK-93
16079	PLINK-93	No problem Bruno. To use basic try that: curl --basic -b cookies.txt -c cookies.txt -u teste:teste "http://localhost:8080/aerogear-controller-demo/basic/" -v Regarding Node.js, can you please attach some example that i can use to test ?	1	1	https://issues.jboss.org/browse/PLINK-93
16080	PLINK-93	Thanks Pedro, I think that the result produced by this command will be the same take a look: curl --basic -b cookies.txt -c cookies.txt -u john:123 "http://localhost:8080/aerogear-controller-demo/basic/" -v Something really curious, I didn't get a chance to debug it on PicketLink, but when I try: curl -u john:123 "http://localhost:8080/aerogear-controller-demo/basic/" -v The response will be HTTP 404, but when I send a request with some invalid user: curl -u homer:simpson "http://localhost:8080/aerogear-controller-demo/basic/" -v The HTTP response will be 401. Is it expected? (I'm talking about the 404 response) If you want to try our demo: git clone https://github.com/abstractj/aerogear-controller-demo cd aerogear-controller-demo & git checkout picketlink_debug mvn clean package and deploy it For Node.js example is quite simple (https://github.com/jaredhanson/passport-http/tree/master/examples), but let me know if you need some help.	1	1	https://issues.jboss.org/browse/PLINK-93
16081	PLINK-84	Hi Bruno, here is what I did to try to simulate the issue: 1) Login using Username/Password 2) Back to the login page 3) Login using username/password/otp (the same goes to facebook authc) After these steps, the user is redirected to the index page. No authentication is performed in step 3 because the user is already authenticated. So, the user is never authenticate again even if using different credentials. This is done by the following code inside the authc endpoints: if (this.identity.isLoggedIn()) { return createResponse(authcRequest); } To overcome this misunderstanding I think we can try Anil's suggestion. What do you think ?	1	1	https://issues.jboss.org/browse/PLINK-84
16082	PLINK-84	Anil, looks like we're talking about different things here. What you're talking about is how to handle session timeouts, when the real issue is: - I have this method {code} @POST @Consumes(MediaType.APPLICATION_JSON) @Produces(MediaType.APPLICATION_JSON) public AuthenticationResponse login(final AuthenticationRequest authcRequest) { if (this.identity.isLoggedIn()) { return createResponse(authcRequest); } credential.setCredential(new OTPCredential(authcRequest.getUserId(), authcRequest.getPassword(), authcRequest.getOtp())); this.identity.login(); return createResponse(authcRequest); } {code} 1 - User will login successfully 2 - Next attempt to login I'll send another credential to the method .setCredential and invoke **again** identity.login(). Is another credential correct? So in theory, it should be validated. Am I wrong?	1	1	https://issues.jboss.org/browse/PLINK-84
16083	PLINK-84	Bruno, I agree that is another credential, but the user will not be re-authenticated because it is already authenticated. The execution stops at: return createResponse(authcRequest); The code you pointed out is not wrong if the requirement is "Users should not be able to authenticate again if they are already authenticated." We can have also another requirement that says "If an authenticated user try to authenticate again we should redirect him to the index page." For that we can change the TODO app. Another requirement I can see is "If an authenticated user try to authenticate again we should ask him if he wants to log out and log in with a different account.". Something like what Anil suggested but with the consent of the user. How do you see this ?	0	0	https://issues.jboss.org/browse/PLINK-84

#	Requirement	Questions	Answered	Successfully Answered	URL
16084	PLINK-81	Hi Bobby, Not sure if I understood your request correctly. Is that all about replacing the ServiceURL from SP's picketlink.xml and get its value from the original request ? The one that originated the AuthnRequest to an IdP ? And use the the "saveRestoreRequest" attribute to control this behavior ? Thanks.	1	1	https://issues.jboss.org/browse/PLINK-81
16085	PLINK-81	Hi [~blawrence], It is more clear. Thanks :) Accordingly with the specs, the AssertionConsumerServiceURL is intended to: "Specifies by value the location to which the <Response> message MUST be returned to the requester". That said, I think you should always use a value that corresponds to a protected URI in your application. Another important aspect of this behavior in PicketLink is that regardless the ACS value, PicketLink will always redirect the user to the original request once the SAML processing is done and he is authenticated at the SP. Any thoughts ? Cheers. Pedro Igor	1	1	https://issues.jboss.org/browse/PLINK-81
16086	PLINK-81	The scenario you described is clear enough to understand the motivation behind this issue. One thing we could do in this case is use system properties to specify the ServiceURL for SPs. So we can set different values when deploying the SP in different servers. But AFAIK, this is not your case. Your scenario is about a SP deployed in a single server and accessed in two different ways (directly on the server or via a reverse proxy). Support a "dynamic" ServiceURL/ACS from requests is something we need to take a closer look. I can think about some implications if we do that. Anyway, I think this issue is now clear as pure water. One last thing, how are you managing this situation today ? Thanks.	1	1	https://issues.jboss.org/browse/PLINK-81
16087	PLFED-343	Pull request sent. What I did is: - Improvement of SAMLEntityParser and SAMLEntitiesParser to filter whitespace characters (I had ClassCastException without this change) - Implementation of FileBasedEntitiesMetadataProvider so it can use metadata config file with "EntitiesDescriptorType" as root element. There is also FileBasedEntityMetadataProvider, which can handle metadata config file with single "EntityDescriptorType". New unit tests added for parsing. - AbstractIDPValve will read metadata for all SP if MetadataProviderType is available in picketlink.xml configuration - If SPSSODescriptorType from metadata contains AuthnRequestsSigned with value "false", then signature won't be verified for this SP and SAML2SignatureValidationHandler will ignore SAMLRequest from this SP. This adds possibility that validation from some SP is available but validation of other SP is disabled (For example Google Apps don't support signed SAMLRequest). If metadata are not provided, signatures are verified (same behaviour like before) - SAML2AuthenticationHandler will now save participant into IdentityParticipantStack according to this: --- If metadata are not provided, SAML2AuthenticationHandler will use same URL like original URL (Same behaviour like before) --- If metadata are provided and they contain "SingleLogoutService", then it will use URL provided by SingleLogoutService. This adds possibility to use different URL for logout then was URL for authentication (this is the case with Salesforce) --- If metadata are provided and they don't contain "SingleLogoutService", then participant is not registered into IdentityParticipantStack, which means that it will be ignored for Single Logout (This is needed for Google Apps for instance because Google Apps doesn't support SAML single logout profile)	0	0	https://issues.jboss.org/browse/PLFED-343
16088	PLFED-193	When there is no SAML Request/Response, after authentication, the IDP forwards to the index page that has links to service providers with the additional query param (?TARGET=url) as per the SAML 1.1 specification. When the user clicks on any of the links, IDP will send the user to the service provider with the saml assertion as SAMLResponse=xxx	0	0	https://issues.jboss.org/browse/PLFED-193
16089	PLFED-189	Does picket link have handler and/or login module for handling SAML 1.1 assertions from STS for ws-trust i.e. web services and not web application SSO. I can get to use the saml 1.1. token provider in picketlink-sts to issue saml 1.1 tokens but cannot find any handler/modules to validate it.	0	0	https://issues.jboss.org/browse/PLFED-189
16090	PLFED-172	Can you check in the changes?	1	1	https://issues.jboss.org/browse/PLFED-172
16091	PLFED-137	You should have opened a discussion thread in the picketlink forums rather than a JIRA issue. You should configure a different authenticator in the SP. Which authenticator exists in your context.xml?	1	1	https://issues.jboss.org/browse/PLFED-137
16092	PLFED-137	Ah sorry, it seemed like a missing feature so I put it in JIRA. I'm using Jetty and basing my work on the example here: http://community.jboss.org/wiki/PicketLinkSAMLSSOforWebContainers So, I'm loading the org.picketlink.identity.federation.web.handlers.saml2.SAML2IssuerTrustHandler, org.picketlink.identity.federation.web.handlers.saml2.SAML2LogOutHandler, and org.picketlink.identity.federation.web.handlers.saml2.SAML2AuthenticationHandler. The last one is the one that is reporting the error. Which authenticator would have done the job?	1	1	https://issues.jboss.org/browse/PLFED-137
16093	PLFED-105	RestEASY has some OAuth work done. Can you take a look at their work and see if we can reuse and advance that code to incorporate OAuth2?	1	1	https://issues.jboss.org/browse/PLFED-105
16094	PLIDM-4	Good to know. Thanks for the comment David! Is it present in 5.1.0.CR1? I was playing with it and 5.0.0.GA and not sure if I missed this behaviour. Actually the only issue I have with JUL is that it doesn't have log.fine("message", exception) style methods...	1	0	https://issues.jboss.org/browse/PLIDM-4
16095	PLINK2-87	Please, can you take a look at the following quickstart ? https://github.com/picketlink2/picketlink-quickstarts/tree/master/saml/employee-multi-protected It is about a service provider with multiple security-constraints, one for each protected folder/resources. The key configuration is how you configure the ServiceURL in picketlink.xml. You'll notice that we use a default entry point for the application using the "/sso/*" URI. This URI is also a protected resource and it is used as ServiceURL and will be used as the entry point for IDP-SP interactions. If the user has previously requested, let's say, /admin/index.jsp, after the login the user will be redirected back to this page with all the state saved (parameters, cookies, etc). Wondering if you can try it out and let us know if we need to consider something else. Thanks.	0	0	https://issues.jboss.org/browse/PLINK2-87
16096	PLINK2-87	Any feedback about the solution above ? Can we close this issue ?	0	0	https://issues.jboss.org/browse/PLINK2-87
16097	PLINK2-85	The IDP is now issuing Assertions with a AuthnStatement.SessionIndex. For now, the SessionIndex value is the same as the Assertion ID. As defined by the specs (saml-core-2.0-os.pdf): "In general, any string value MAY be used as a SessionIndex value. However, when privacy is a consideration, care must be taken to ensure that the SessionIndex value does not invalidate other privacy mechanisms. Accordingly, the value SHOULD NOT be usable to correlate activity by a principal across different session participants. Two solutions that achieve this goal are provided below and are RECOMMENDED: • Use small positive integers (or reoccurring constants in a list) for the SessionIndex. The SAML authority SHOULD choose the range of values such that the cardinality of any one integer will be sufficiently high to prevent a particular principal's actions from being correlated across multiple session participants. The SAML authority SHOULD choose values for SessionIndex randomly from within this range (except when required to ensure unique values for subsequent statements given to the same session participant but as part of a distinct session). • Use the enclosing assertion's ID value in the SessionIndex" Also, logout requests are always including the SessionIndex element.	1	1	https://issues.jboss.org/browse/PLINK2-85

#	Requirement	Questions	Answered	Successfully Answered	URL
16098	PLINK2-71	We have the need, in our project to reload dynamically the PDP policies. This feature is particuarly critical during the deployment period of out product, when policies are aligned frequently with our customer security model. Do you have a plan for this feature request ? Regards Vincent	1	0	https://issues.jboss.org/browse/PLINK2-71
16099	PLINK2-71	Vincent, we can look at this from multiple directions: 1) The servlets can be configured to create a new PDP (that would get new policies) periodically that can be configured. Saying, refresh the PDP every 2 minutes or so. 2) The individual policy locators such as ldap policy locator can be beefed up to look at aspects such as "modifyTimeStamp" on the ldap entry to refesh the policies that it has. Option1 is the simplest to do at the moment. Option 2 will take some extra time. What is your opinion?	0	0	https://issues.jboss.org/browse/PLINK2-71
16100	PLINK2-67	Can anyone give me a status update on this? Will the fix described in PLINK-146 work in the 2.5.x series? We have an SP that would very much like for us to be able to provide them assertions signed this way. Based on the description in PLINK-146 it looks like this will globally (ie. for all SP's) add a x509 signature block to the returned assertion in addition to the current RSA block? thanks	0	0	https://issues.jboss.org/browse/PLINK2-67
16101	PLINK2-51	Why is the content of the 2 conditions the same? {code} // try using the truststore alias from the service provider metadata. ServiceProviderType provider = this.spMetadata.get(serviceName); if (provider != null && provider.getTruststoreAlias() != null) { Certificate cer = this.trustManager.getCertificate(provider.getTruststoreAlias()); if(cer instanceof X509Certificate) { x509 = (X509Certificate)cer; } } // if there was no truststore alias or no PKC under that alias, use the KeyProvider mapping. if (x509 == null) { Certificate cer = this.trustManager.getCertificate(provider.getTruststoreAlias()); if(cer instanceof X509Certificate) { x509 = (X509Certificate)cer; } } {code} Our tests fails with NPE in the method: {code} 14:27:48,420 WARNING [org.apache.cxf.phase.PhaseInterceptorChain] (http-/127.0.0.1:8080-22) Application {urn:picketlink:identity-federation:sts}PicketLinkSTS#{urn:picketlink:identity-federation:sts}IssueToken has thrown exception, unwinding now: org.apache.cxf.interceptor.Fault: PLFED000010: Error obtaining public key for service: http://localhost:8080/jaxws-samples-wsse-policy-trust/SecurityService at org.apache.cxf.service.invoker.AbstractInvoker.createFault(AbstractInvoker.java:162) [cxf-api-2.7.6.redhat-2.jar:2.7.6.redhat-2] at org.apache.cxf.jaxws.AbstractJAXWSMethodInvoker.createFault(AbstractJAXWSMethodInvoker.java:213) at org.apache.cxf.service.invoker.AbstractInvoker.invoke(AbstractInvoker.java:128) [cxf-api-2.7.6.redhat-2.jar:2.7.6.redhat-2] at org.apache.cxf.jaxws.AbstractJAXWSMethodInvoker.invoke(AbstractJAXWSMethodInvoker.java:178) at org.apache.cxf.jaxws.JAXWSMethodInvoker.invoke(JAXWSMethodInvoker.java:68) at org.jboss.wsf.stack.cxf.JBossWSInvoker.invoke(JBossWSInvoker.java:129) at org.apache.cxf.interceptor.ServiceInvokerInterceptor$1.run(ServiceInvokerInterceptor.java:57) [cxf-api-2.7.6.redhat-2.jar:2.7.6.redhat-2] at java.util.concurrent.Executors$RunnableAdapter.call(Executors.java:439) [rt.jar:1.6.0_45] at java.util.concurrent.FutureTask$Sync.innerRun(FutureTask.java:303) [rt.jar:1.6.0_45] at java.util.concurrent.FutureTask.run(FutureTask.java:138) [rt.jar:1.6.0_45] at org.apache.cxf.workqueue.SynchronousExecutor.execute(SynchronousExecutor.java:37) [cxf-api-2.7.6.redhat-2.jar:2.7.6.redhat-2] at org.apache.cxf.interceptor.ServiceInvokerInterceptor.handleMessage(ServiceInvokerInterceptor.java:106) [cxf-api-2.7.6.redhat-2.jar:2.7.6.redhat-2] at org.apache.cxf.phase.PhaseInterceptorChain.doIntercept(PhaseInterceptorChain.java:271) [cxf-api-2.7.6.redhat-2.jar:2.7.6.redhat-2] at org.apache.cxf.transport.ChainInitiationObserver.onMessage(ChainInitiationObserver.java:121) [cxf-api-2.7.6.redhat-2.jar:2.7.6.redhat-2] at org.apache.cxf.transport.http.AbstractHTTPDestination.invoke(AbstractHTTPDestination.java:239) at org.jboss.wsf.stack.cxf.RequestHandlerImpl.handleHttpRequest(RequestHandlerImpl.java:93) at org.jboss.wsf.stack.cxf.transport.ServletHelper.callRequestHandler(ServletHelper.java:143) at org.jboss.wsf.stack.cxf.CXFServletExt.invoke(CXFServletExt.java:87) at org.apache.cxf.transport.servlet.AbstractHTTPServlet.handleRequest(AbstractHTTPServlet.java:286) at org.apache.cxf.transport.servlet.AbstractHTTPServlet.doPost(AbstractHTTPServlet.java:206) at javax.servlet.http.HttpServlet.service(HttpServlet.java:754) [jboss-servlet-api_3.0_spec-1.0.2.Final-redhat-1.jar:1.0.2.Final-redhat-1] at org.jboss.wsf.stack.cxf.CXFServletExt.service(CXFServletExt.java:135) at org.jboss.wsf.spi.deployment.WSFServlet.service(WSFServlet.java:140) [jbossws-spi-2.2.1.Final-redhat-1.jar:2.2.1.Final-redhat-1] at	0	0	https://issues.jboss.org/browse/PLINK2-51
16102	PBR-519	this commit (6b39d81) will break the support of Weld 1.1.13 (JBoss EAP-6.1.1) because in the Portal-Render-Phase the WeldPhaseListener don't get a RESTORE_VIEW Phase anymore and therefore no conversation-context was bound to current thread. Is this intended? Currently there is no way to configure around this...	0	0	https://issues.jboss.org/browse/PBR-519
16103	PBR-519	okay thanks another question, this changeset will break the JSR-329 spec too {quote} 5.2.6 Executing a Portlet Render Request .. ensure that all PhaseListeners listening on the before and after phase of the PhaseId.RESTORE_VIEW are called {quote} i know that JSR-329 is for JSF-1.2 Portlets. Is there a new spec (draft?) for JSF2-Portlets anywhere? which behavior i can expect from a JSF2-Portletbridge implementation? why can i skip the Portlet Integration Library with an CDI/1.1 conform implementation as you mentioned in the first comment?	0	0	https://issues.jboss.org/browse/PBR-519
16104	PBR-519	Hi Ken, Is there some new requirement or feature of CDI 1.1 that forces implementations (Weld, OpenWebBeans, CanDI) to get rid of the casts to HttpServletRequest? Or did the JBoss engineers simply decide to refactor the CDI 1.1 branch of Weld so that it no longer has the casts? Thanks! Neil	1	1	https://issues.jboss.org/browse/PBR-519
16105	PBR-495	Which browsers don't handle self closing tags properly? To my understanding all modern browsers can handle this fine, and is now the preferred method. Also, I'm not sure it's a good idea to be modifying code of anything that passes through the Bridge. If the code that includes the script is doing something that is not supported, ie. self closing tags, then it should be modified directly as opposed to getting the Bridge to modify it. Right now, I don't see a good reason for doing this.	1	1	https://issues.jboss.org/browse/PBR-495
16106	PBR-378	Wouldn't this be better to be included in the community project so that the regular build, or with a profile, could run the TCK? Seems preferable to waiting until a commit is made to find that the TCK is broken.	1	1	https://issues.jboss.org/browse/PBR-378
16107	PBR-378	Are you running the tests against Pluto or GateIn? Did you follow the advice in PBR-254 about which tests to de-activate as they won't work with other tests enabled?	1	1	https://issues.jboss.org/browse/PBR-378
16108	PBR-374	Also, is there a particular reason why the redirect is being done in a Phase Listener?	1	1	https://issues.jboss.org/browse/PBR-374
16109	PBR-307	This solution would break the createResourceURL function (create resourceURL pointing back to same portlet for a serverResourceRequest): {code:title=backingbean.java} static public String createResURL(String key) { FacesContext facesContext = FacesContext.getCurrentInstance(); String url; MimeResponse response = (MimeResponse) facesContext.getExternalContext().getResponse(); ResourceURL resourceURL = response.createResourceURL(); resourceURL.setResourceID(key); url = resourceURL.toString(); return url; } {code} additional, now it's impossible to get static-urls (cacheable for browsers) to images/css/.... or is there still a way to get the old (v2.2.0) behaviour?	0	0	https://issues.jboss.org/browse/PBR-307

#	Requirement	Questions	Answered	Successfully Answered	URL
16110	PBR-282	Hi, if the servlet is accessed through a portlet (resource request) than there is a portlet request and the bridge should access it correctly. Shouldn't it?	1	1	https://issues.jboss.org/browse/PBR-282
16111	PBR-267	How can I use this patch to get my richfaces-portlets working in liferay? Is this patch in the jboss-portletbridge svn? Can you provide a jar-file with this fix?	0	0	https://issues.jboss.org/browse/PBR-267
16112	PBR-254	Most failing tests thre UnsupportedOperationException... so I added this to AbstractExternalContext: private Bridge.PortletPhase getPortletPhase() { return (Bridge.PortletPhase) getRequestMap().get(Bridge.PORTLET_LIFECYCLE_PHASE); } @Override public String getRequestCharacterEncoding() { if (getPortletPhase() != null && request instanceof ClientDataRequest) { return ((ClientDataRequest) request).getCharacterEncoding(); } else { // other phases -- return null as per spec return null; } //return super.getRequestCharacterEncoding(); } This also seems to solve https://issues.jboss.org/browse/PBR-199, which is the same error. @Alex - can you double check this and make sure it is best approach? it is checked in as of r901 on trunk	1	1	https://issues.jboss.org/browse/PBR-254
16113	PBR-254	Many tests failed because of possible TCK issue, that threats URLs not started with application context as internals. Following this logic (and given Oracle's use of encodeActionURL to encode its equivalent of the OutputLink) then encodeAction should do a return portletResponse.encodeURL(target) if the url begins with a / and isn't (this application) context-path prefixed. I.e. we need the bridge code to give the portlet container a chance to encode the server/port (construct and absolute url) -- typically when the portlet container is remote. Sound about right? I know the spec doesn't say anything about this but it seems to fall out from this decision/interpretation. Does your code already do this? If not should it? -Mike- On 6/14/2011 1:29 PM, Michael Freedman wrote: > So what you are saying is that because ViewHandler.getResourceURL() is defined and it will always append the ContextPath then the spec/impl should assume that urls starting with '/' that don't contain a ContextPath must be out of the application (because all in application urls would have been channeled through getResourceURL? I.e. just using /xxx as a resource url without a context path doesn't work in servlet based JSF. Interesting -- okay I see your logic. Please file a JIRA against the TCK indicating the test url it should use ought to be "resources/myImage.jpg?javax.portlet.faces.BackLink=myBackLinkParam". If possible please make the needed changes yourself and verify (and then submit the jira with either the details of the code change or a patch file). > > I will file a bug against the RI concerning its not treating / as an external url -- and since we are changing the test/fixing a bug will just include in the 2.0.1 release. > -Mike-	1	1	https://issues.jboss.org/browse/PBR-254
16114	PBR-254	Was a little trigger happy to close this issue :) I will reopen it until we get full certification from Oracle. This is now tagged for certification and next release (QE). http://anonsvn.jboss.org/repos/portletbridge/tags/2.1.1.CR1/	0	0	https://issues.jboss.org/browse/PBR-254
16115	PBR-222	which plugins? we are still from jboss-parent pom here inheriting http://anonsvn.jboss.org/repos/portletbridge/tags/2.1.0.CR2.EPP51/parent/pom.xml and I haven't changed any versions in particular that I'm aware. But could have made changes to build with Maven 3.	1	1	https://issues.jboss.org/browse/PBR-222
16116	PBR-216	How to replicate this issue: - deploy the richfaces demo application into GateIn - load the portlet on one page and on another page but over wsrp - check the links at the top of the richfaces demo. In the non wsrp case they will point to external links, in the wsrp case they will point to a wsrp url (since the url is being encoded through wsrp).	1	1	https://issues.jboss.org/browse/PBR-216
16117	PBR-198	No longer an issue in the latest 2.0 CP05 patch. Just use portlet 2.0 public render params	1	1	https://issues.jboss.org/browse/PBR-198
16118	PBR-198	Yes, the public render parameter will work. But I am looking for a url parameter that works well with the page parameter defined in the Seam application. A url like http://localhost:8080/portal/portal/default/PortletParamTest?userUsername=demo1 still doesn't seem to work in portlet bridge 2.0. Am I missing anything here?	1	1	https://issues.jboss.org/browse/PBR-198
16119	PBR-198	Sure thing, keep in mind this is only for GateIn. If anybody needs this to work on JBoss Portal they can submit a patch with almost exact code as what I checked in. Gary - If you need this for EPP 4.3/JBoss Portal, can you submit a patch? otherwise I will resolve this issue...	0	0	https://issues.jboss.org/browse/PBR-198
16120	PBR-191	@Balazs - Can you verify and test the following snapshot in your liferay setup? https://repository.jboss.org/nexus/content/repositories/snapshots/org/jboss/portletbridge/portletbridge-api/2.0.1-SNAPSHOT/portletbridge-api-2.0.1-20100917.004919-1.jar https://repository.jboss.org/nexus/content/repositories/snapshots/org/jboss/portletbridge/portletbridge-impl/2.0.1-SNAPSHOT/portletbridge-impl-2.0.1-20100917.004942-1.jar	1	1	https://issues.jboss.org/browse/PBR-191
16121	PBR-188	Waldemar, Do you have a simple test war that illustrates the problem you describe? I could then use it in resolving the issue. Thanks Ken	1	1	https://issues.jboss.org/browse/PBR-188
16122	PBR-185	can you close this issue since PRP is not a problem and create a jira for doc update and another for archetype update?	1	0	https://issues.jboss.org/browse/PBR-185
16123	PBR-133	After I applied your changes to trunk, I am getting quite a few exceptions from other classes - mainly using classes from the richfaces 3.x codebase. Did you actually get this to compile? If so, what other changes did you make?	0	0	https://issues.jboss.org/browse/PBR-133
16124	PBR-119	Fix has been made on trunk. The artifact id naming convention was previously used for a workaround with cargo profiles and automatic deployment. But those have been removed from the archetype(s) for this next CR2 release. Snjezana - I tested the changes on JBT 3.0, can you confirm on 3.1 on your end?	0	0	https://issues.jboss.org/browse/PBR-119
16125	PBR-94	To be sure we are talking about the same subject : Is this feature related with the "A4J.AJAX.onExpired JavaScript function never called" problem ? This is discussed here : http://www.jboss.org/index.html?module=bb&op=viewtopic&t=144693	1	0	https://issues.jboss.org/browse/PBR-94
16126	PBR-58	what do you think of not creating any new @annotation, we could use the current @RaiseEvent and add some portlet option listing the names of the events which are relayed from internal only to the portal coordination. This would mean you don't need to add anything to seam, just add an auto-installing Seam component to the portletbridge which listens to configured events. This would be a standard Seam component needing access to the portlet configuration/option/properties and provide complete decoupling.	1	1	https://issues.jboss.org/browse/PBR-58
16127	PBR-58	Sounds even better. Have you started prototyping this at all?	1	1	https://issues.jboss.org/browse/PBR-58

#	Requirement	Questions	Answered	Successfully Answered	URL
16128	PBR-11	A small question about the created Archetypes, what is the functionality of the following lines in the *-objects.xml.... <instance> <instance-name>RichFacesEchoPortletInstance3</instance-name> <component-ref>richfacesEchoApp.RichFacesEchoPortlet3</component-ref> </instance> I am asking this because, these lines are coming with the Archetype but Portal 2.6.4 complains that instance definitions in *-objects.xml are deprecated but Archetype use it anyway. Are they specially necessary for RichFaces-Portal or it would function anyway if we live these lines out? The whole *-objects.xml looks like following. <deployments> <deployment> <if-exists>keep</if-exists> <parent-ref>tvpp</parent-ref> <instance> <instance-name>RichFacesEchoPortletInstance3</instance-name> <component-ref>richfacesEchoApp.RichFacesEchoPortlet3</component-ref> </instance> </deployment> <deployment> <parent-ref>tvpp</parent-ref> <if-exists>overwrite</if-exists> <page> <page-name>RichFacesEchoPortlet3</page-name> <window> <window-name>RichFacesEchoPortletWindow3</window-name> <instance-ref>RichFacesEchoPortletInstance3</instance-ref> <region>left</region> <height>0</height> <initial-window-state>maximized</initial-window-state> <properties> <property> <name>theme.renderSetId</name> <value>emptyRenderer</value> </property> </properties> </window> </page> </deployment> </deployments>	1	1	https://issues.jboss.org/browse/PBR-11
16129	PRESSGANG-76	Would a simple smoke Test that uses JDK's build in Transformer stuff a good start or do we need something completly different? {code} // jdk1.4.1 import javax.xml.transform.*; import java.net.*; import java.io.*; public class HowToXSLT { public static void main(String[] args) { try { TransformerFactory tFactory = TransformerFactory.newInstance(); Transformer transformer = tFactory.newTransformer (new javax.xml.transform.stream.StreamSource ("howto.xsl")); transformer.transform (new javax.xml.transform.stream.StreamSource ("howto.xml"), new javax.xml.transform.stream.StreamResult (new FileOutputStream("howto.html"))); } catch (Exception e) { e.printStackTrace( ); } } } {code} Alternatively, I can also look at just setting up pressgang-examples, and build that pdf and html as part of the build. If the xslt is invalid, that will just crash.	1	1	https://issues.jboss.org/browse/PRESSGANG-76
16130	PRESSGANG-70	Would we also need to create a ns version of the jbossorg-jdocbook-style plugin? At the moment, Publican still uses DocBook 4.5, so would we need to keep the non-ns version at 4.5 for cross-compatibility. Does the DTD/Schema declaration need to match the XSLT declaration? That's not to say that I shouldn't raise DocBook5 support as a future enhancement on the publican-list. I think I should release JDOCBOOKSTYLE-3, JDOCBOOKSTYLE-4, and this ticket as 1.2 now (branch the trunk for the release). I think moving the repo to the PressGang SVN would also be a good thing to do for the 1.2 release. I'll update the release milestones and you can go forth and implement the fix and branch the codebase. Depending on what other enhancements are implemented between this week and the next release (1.3 at this stage), it might be worth encouraging people to convert their CSS entensions to the ns version.	1	1	https://issues.jboss.org/browse/PRESSGANG-70
16131	PRESSGANG-69	Hi Geoffrey I really like the sound of Option 1. I had the same thought as you about how all the names are different. Yes, I've inherited a motley bunch of packages in their current form. In nautical terms, it's time to get them shipshape ;) In response to your proposed options: >Alternative 1: >* The parent pom has the id org.jboss.documentation-support:jbossorg-documentation-support >** All module pom.xml files must extend this parent pom.xml and declare nothing that is general to all modules (scm, distribution, ...). >* Each module gets the same groupId (regardless of it's former groupId): org.jboss.documentation-support >** Note that this already effectively breaks all pom level backward compatibility. I'd like to see "docbook-support" renamed to something like "jbossorg-jdocbook-styles" to make it a bit clearer. Seeing that I want to move these styles into PressGang, would it be appropriate to name the pom ID: org.jboss.PressGang:jbossorg-jdocbook-style >* The module artifactId's must be renamed: I agree totally; they are all over the place at the moment. Using the naming syntax as I understand it, and moving everything into PressGang, would these names be correct? >** hightlight => jbossorg-documentation-highlight org.jboss.jbossorg-jdocbook-styles:jdocbook-style-highlight >** jbossorg-fonts => jbossorg-documentation-fonts org.jboss.jbossorg-jdocbook-styles:jdocbook-style-fonts >** jbossorg-docbook-xslt => jbossorg-documentation-docbook-xslt org.jboss.jbossorg-jdocbook-styles:jdocbook-style-xslt >** jbossorg-jdocbook-style => jbossorg-documentation-jdocbook-style org.jboss.jbossorg-jdocbook-styles:jdocbook-style-CSS >** documentation => jbossorg-documentation-docs org.jboss.jbossorg-jdocbook-styles;jdocbook-style-userguide Do I understand how pom module naming works in my suggestions? If not please set me straight. Cheers J	1	1	https://issues.jboss.org/browse/PRESSGANG-69
16132	PRESSGANG-69	By changing the groupId's and artifactId's, we made backward incompatible (build level) changes, that's the reason why I think we should call a release with the new groupId's 2.0.0 instead of 1.2.0. But calling it version 1.2.0 is fine too. What I do feel stronger about is this: don't release without doing first "Move the contents of jboss_community_styles on directory up, rename the artifact jboss-community-styles to pressgang-parent" and "All the child modules must have a <parent> declaration to the pressgang-parent", as you 'll change the parent artifactId again by that action (= might be another backward incompatible (build level) change). "jaredmorgs: I don't think I want to publish the JDG along with the styles. The idea is to keep the styles and JDG separate, so we don't have to release them all in one large chunk. The JDG will be in states of development more than the styles." Good point. Still I 'd propose to make the directory name equal to the artifactId in the pom in that directory. As I see it, you 'll want the JDG to have a separate version number (and all the rest shares the same version number of course). Do you want the JDG pom to have as a parent the pressgang-parent pom? I would and do these things: - still rename it to pressgang-jboss-documentation-guide (both directory and artifactId) - overwrite the version number in pressgang-jboss-documentation-guide pom.xml (Don't overwrite the version number in the other child poms)	1	1	https://issues.jboss.org/browse/PRESSGANG-69
16133	PRESSGANG-69	So if I was building all the jboss style bundle artifacts from the parent-pom, how would I exclude the JDG from being packaged at the same time and released along with the style packages. What I want to avoid is having to complete tasks for the JDG before I can release the styles, or vice versa. This could be my ignorance of Maven packaging methods showing here.	1	1	https://issues.jboss.org/browse/PRESSGANG-69

#	Requirement	Questions	Answered	Successfully Answered	URL
16134	PRESSGANG-69	C) Looks like pressgang-jdocbook-style's pom.xml went missing when copying from the old repo to the new? Maybe similar for docs and docbook-support D) Every child should have <parent><groupid/artifactId/version/type></parent> reference to the pressgang pom. Just copy paste from https://svn.jboss.org/repos/labs/labs/jbossrules/trunk/drools-docs/drools-docs-planner/pom.xml . Since everything is inherited, you can delete these entities: groupId, version, organization, scm, repositories, build, distributionManagement, ... As for dependencies, you should use dependencyManagement in the pressgang pom to define the versions and just specify groupId and artifactId without version in the dependencies. E) I do agree that you don't want the JDG on the same level as the tools modules. so I 'd suggest this id's: groupId = org.jboss.pressgang (artifact-prefix: pressgang) parent module: pressgang Child modules of pressgang: - pressgang-documentation-guid - pressgang-tools Child modules of pressgang pressgang-tools: - pressgang-highlight - pressgang-fonts - pressgang-xslt - pressgang-xslt-ns - pressgang-jdocbook-style - pressgang-docs If you do A, B and C, I can do D and E (easier to do than to explain :).	0	0	https://issues.jboss.org/browse/PRESSGANG-69
16135	PRESSGANG-69	Hi, any news on this? Especially not executing A) is dangerous because it effectively forks the project. Want me to execute some of these?	0	0	https://issues.jboss.org/browse/PRESSGANG-69
16136	PRESSGANG-68	Is this fixed? If so, it's included in the 2.0.0 release. There was no 1.2 release (because of GAV changes to get some order into things, see pressgang svn)	0	0	https://issues.jboss.org/browse/PRESSGANG-68
16137	PRESSGANG-64	Have you verified that this works in both Maven and Publican?	1	1	https://issues.jboss.org/browse/PRESSGANG-64
16138	PRESSGANG-64	Hey Sean Do you have to specify any maven attributes when you publish, or does the publishing toolchain apply the correct formatting automatically? Do you need to make any pom.xml changes? Cheers J	1	1	https://issues.jboss.org/browse/PRESSGANG-64
16139	PRESSGANG-58	Hi Darrin I applied your patch, and verified that there are some <programlisting> without the role attribute applied. I was testing this on the JBoss Documentation Guide book, which has examples of this structure in the "Disallowed Attributes" section. (https://svn.jboss.org/repos/pressgang/) I'm not seeing the highlighting behaviour as described in your fix. The code remains unhighlighted. You can test this out using the 1.1.1.SNAPSHOT for jbossorg-jdocbook-style. If you are using the JBoss Docs Guide as the testbed, this is preconfigured in the POM. Would you be able to take another look and see what might be causing the issue? Cheers Jared	1	1	https://issues.jboss.org/browse/PRESSGANG-58
16140	PRESSGANG-58	Geoffrey I've got some information about how to get highlighting working in the JBoss Documentation Guide. The direct link to the info is here (Hudson-hosted document): http://hudson.jboss.org/hudson/job/JBoss_Documentation_Guide/lastSuccessfulBuild/artifact/JBoss_Documentation_Guide/target/docbook/publish/en-US/html_single/index.html#sgce-Structure_Guidlines_Code_Examples I'll raise a ticket to get this information updated, and have the latest jbossorg-jdocbook-style information added as well. I think the jDocBook Plugin Manual probably needs to be taken under the wing of PressGang, and perhaps integrated into the JDG? What do you reckon? Cheers Jared	1	1	https://issues.jboss.org/browse/PRESSGANG-58
16141	PRESSGANG-58	Tested this change on the drools docs. I replaced all <programlisting role="JAVA"> with <programlisting language="java">. I replaced all <programlisting role="XML"> with <programlisting language="xml">. >> I'm not seeing the highlighting behaviour as described in your fix. The code remains unhighlighted. Did you do the necessary replacing in the JBG?	1	1	https://issues.jboss.org/browse/PRESSGANG-58
16142	PRESSGANG-58	Because it uses xmlns:jhr="com.uwyn.jhighlight.renderer.Renderer" Does that mean that the highlight module in docbook-support is dead code? => No, looks like the highlight module extends the jhightlight artifact (see the resources property file)	1	1	https://issues.jboss.org/browse/PRESSGANG-58
16143	PRESSGANG-56	Did a few more experiments tonight. Firebug shows that firefox thinks there's text between the " " and the "<p>": " " (with maybe a \n). Possible path 1: Either we stop firefox from rendering that " " in xhtml, maybe by a html (likely) or CSS (unlikely) property. Possible path 2: Or we somehow tell docbook to not ident/pretty format the xhtml output, so the output is " <p>" It looks like hibernate is doing the second.	1	1	https://issues.jboss.org/browse/PRESSGANG-56
16144	PRESSGANG-53	PS: If this is not the correct project to make a jbossorg-jdocbook-style issue, my apologies. In that case, could you direct me where to move it to? It would be nice to centralize the documentation of both the jdocbook plugin and the jbossorg-jdocbook-style.	1	1	https://issues.jboss.org/browse/PRESSGANG-53
16145	PRESSGANG-52	(11:56:26 AM) sebersole: jmorgan: anyway, like i said i think we can get away with jhighlight (11:56:38 AM) sebersole: the issue seems to be how it is applied in the xslt (11:56:47 AM) jmorgan: Oh, OK. (11:56:51 AM) sebersole: yes it is limited in what it can highlight (11:57:11 AM) sebersole: is kate ported to qt4 yet? (11:57:17 AM) jmorgan: For our purposes however, XML and Java work just fine (for the most part, anyhow). (11:57:22 AM) jmorgan: Hmm, not sure again sebersole (11:57:37 AM) sebersole: so i'd say: (11:57:46 AM) sebersole: 1) if kate is qt4, and (11:58:12 AM) sebersole: 2) its highlighting library is ported to qt4, and (11:58:28 AM) sebersole: 3) there is a java language binding for qt4 (11:58:33 AM) sebersole: then we make use of all that (11:59:02 AM) sebersole: otherwise, its not worth the effort involved (11:59:11 AM) sebersole: and we just stick with what we got (11:59:25 AM) sebersole: (with fixes to xslt, hopefully)	1	1	https://issues.jboss.org/browse/PRESSGANG-52
16146	PRESSGANG-52	Yet another highlighting library: http://code.google.com/p/google-code-prettify/ Supports Java and xml and more: "bsh", "c", "cc", "cpp", "cs", "csh", "cyc", "cv", "htm", "html", "java", "js", "m", "mxml", "perl", "pl", "pm", "py", "rb", "sh", "xhtml", "xml", "xsl" Powers code.google.com and stackoverflow.com. Is written in JavaScript and renders at runtime in HTML... Threats: - Probably not applicable for code highlighting in PDF output. Given the code highlighting mess we're currently in, I might be able to live with this (Steve doesn't use PDF IIRC). - How does it react on a single html page with lots and lots of code fragments? How much slower does the page load in FF, Chrome and IE? This is critical.	0	0	https://issues.jboss.org/browse/PRESSGANG-52
16147	PRESSGANG-50	Hi Ondrej That sounds great. I wonder how we could get that into the PressGang styles? We would need to create a Maven artifact for that, wouldn't we? This is where I run into problems. I am not a developer (as you know) so what I can do is largely dependent on the skills I can get from the community. Would you know how to implement this into PressGang styles? Would you know someone who could lend a hand with this? Cheers J	1	1	https://issues.jboss.org/browse/PRESSGANG-50
16148	PRESSGANG-50	Hi Jared, could you provide some link to PressGang source so I could look where the syntax highlighter could go? Thanks.	1	1	https://issues.jboss.org/browse/PRESSGANG-50
16149	PRESSGANG-46	Hi Isaac Can you provide more information about where you are pulling the enterprise styles from? If I understand it correctly (and I am new to how these styles hold together), the jbossorg-jdocbook-styles are the base styles projects use. What each project does is then override certain aspects of the base CSS with project-specific style tweaks. Is this what has happened with the JBDS Maven build? If so, we can try and correct some of the issues in the base styles so everyone can benefit from them. However, I believe CSS overrides that projects implement are up to them to maintain. That being said, for those changes that projects feel improve the base styles, we need to move those into the base styles. This will result in a few positives: - take the pressure off projects to maintain extensive overrides. - improve the quality of the base jbossorg-jdocbookl-styles. We should investigate what CSS overrides are implemented in JBDS, and see what we can do to streamline them a bit for your team.	1	0	https://issues.jboss.org/browse/PRESSGANG-46

#	Requirement	Questions	Answered	Successfully Answered	URL
16150	PRESSGANG-43	I find I use replaceable in <programlistings> to highlight stuff users should change. Darrin, do you think there's a better way to do this. What method do you prefer to use? Do you find it puts garbage in the <programlisting> that will cause parse errors if users copy the code sample.	1	0	https://issues.jboss.org/browse/PRESSGANG-43
16151	PRESSGANG-42	Do you have any suggestions as to how this might be corrected in the styles, Sean? Have you tried to add the – and — entities to the .ent file? Does this allow jDocBook to render the em-dash and en-dash correctly?	1	1	https://issues.jboss.org/browse/PRESSGANG-42
16152	PRESSGANG-40	I am not using subtitle, just this {code} <book version="5.0" xsi:schemaLocation="http://docbook.org/ns/docbook http://www.docbook.org/xml/5.0/xsd/docbook.xsd http://www.w3.org/1999/xlink http://www.docbook.org/xml/5.0/xsd/xlink.xsd" xml:base="./" xmlns="http://docbook.org/ns/docbook" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:xs="http://www.w3.org/2001/XMLSchema" xmlns:xlink="http://www.w3.org/1999/xlink" xmlns:xi="http://www.w3.org/2001/XInclude" xmlns:ns="http://docbook.org/ns/docbook"> <info> <title>Drools Planner User Guide</title> <releaseinfo>Version &project.version;</releaseinfo> ... {code} But I see no difference in my html output: http://docs.jboss.org/drools/release/5.3.0.Final/drools-planner-docs/html/index.html and my single_html output: http://docs.jboss.org/drools/release/5.3.0.Final/drools-planner-docs/html/index.html Can you check if both of my pages have what you want yours to have?	1	0	https://issues.jboss.org/browse/PRESSGANG-40
16153	PRESSGANG-39	Hi Martin Have you tried using the highlight package from the new JBoss repos for the styles. They now reside in a different location. I've attached the pom.xml that we use to generate the JBoss Documentation Guide. What we can do with the highlighter package is limited. It is unfortunately not maintained by anyone. :(I know that Steve Ebersole has done a lot of work with Callouts in his Hibernate project. Try altering the dependencies in your project with those in the attached pom, and let me know how you go. Cheers Jared	1	1	https://issues.jboss.org/browse/PRESSGANG-39
16154	PRESSGANG-39	Hi Jared, can you please provide us with more info? Like which dependencies and plugins we should use and how to use the highlight package? I'm quite confused about it right now. Our pom.xml is located at https://github.com/weld/core/blob/1.1.0.Final/docs/reference/pom.xml. Thank you	1	1	https://issues.jboss.org/browse/PRESSGANG-39
16155	PRESSGANG-39	Hi Martin I can't see how you guys are implementing the base styles in your project pom. Usually you have to declare a styles package in your docs pom, but I can't see any mention of a styles dependency (which would include the highlighter package). Most projects declare the base styles in the pom, then override certain parts of them with their project-specific requirements. Such as the Weld Banner, and coloration. I've checked your pom, and I can't see any dependencies to the pressgang-jdocbook-style (formerly the jbossorg-jdocbook-style plugin dependency). The pressgang-jdocbook-style dependency contains callout numbers from 1 to 15. Is that the color that you saw in your code samples before they disappeared? I have also commented on WELD-826 to get more information. Cheers Jared	1	1	https://issues.jboss.org/browse/PRESSGANG-39
16156	PRESSGANG-39	Hmm, I just opened this page [1] up in FireFox, and the callouts look awesome to me. What browser are you using? [1] http://docs.jboss.org/weld/reference/1.1.0.Final/en-US/html_single/#d0e2802	0	0	https://issues.jboss.org/browse/PRESSGANG-39
16157	PRESSGANG-39	underscores in the area ID attribute values = no change # Removed full stops and tried CamelCase in area ID attribute values = no change I compared the code in the standard programlisting before the callout listing: {code} </p><pre xmlns="" xmlns:rf="java:org.jboss.highlight.XhtmlRendererFactory" class="XML"><!-- XML : generated by JHighlight v1.0 (http://jhighlight.dev.java.net) --> <faces-config version="2.0" xmlns="http://java.sun.com/xml/ns/javaee" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:schemaLocation=" http://java.sun.com/xml/ns/javaee http://java.sun.com/xml/ns/javaee/web-facesconfig_2_0.xsd"> </faces-config> </pre><p> {code} I then took a look at the code behind the programlistingco: {code} </p><div class="programlistingco"><pre xmlns="" xmlns:rf="java:org.jboss.highlight.XhtmlRendererFactory" class="XML"><!-- XML : generated by JHighlight v1.0 (http://jhighlight.dev.java.net) --> <web-app version="2.5" xmlns="http://java.sun.com/xml/ns/javaee" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:schemaLocation=" http://java.sun.com/xml/ns/javaee http://java.sun.com/xml/ns/javaee/web-app_2_5.xsd"<span	0	0	https://issues.jboss.org/browse/PRESSGANG-39

#	Requirement	Questions	Answered	Successfully Answered	URL
16158	PRESSGANG-39	It seems not ok. Could you please tell me which version 'maven-jdocbook-plugin' and 'jbossorg-docbook-xslt' should I use. I am now using '2.3.8' and '1.1.1': The document look like: <process id="paymentProcess"> ml_plain"> <actions> ml_plain"> <action id="step1" ref="prepareParameter"/> ml_plain"> <action id="step2" ref="insertJournal"/> ml_plain"> <action id="step3" ref="callUnionpay"/> ml_plain"> <action id="step4" ref="updateJournal" /> <action id="step5" ref="prepareResponse"/> </actions> </process> Here is my pom config: <groupId>org.jboss.maven.plugins</groupId> <artifactId>maven-jdocbook-plugin</artifactId> <version>2.3.8</version> <extensions>true</extensions> <dependencies> <dependency> <groupId>org.jboss</groupId> <artifactId>jbossorg-docbook-xslt</artifactId> <version>1.1.1</version> </dependency> <dependency> <groupId>org.jboss</groupId> <artifactId>jbossorg-jdocbook-style</artifactId> <version>1.1.1</version> <type>jdocbook-style</type> </dependency> </dependencies>	1	0	https://issues.jboss.org/browse/PRESSGANG-39
16159	PRESSGANG-39	Do you mean using 'pressgang-xslt' 2.x version ?	0	0	https://issues.jboss.org/browse/PRESSGANG-39
16160	PRESSGANG-36	I totally agree Geoffrey. What do you think we could do to substitute that highlighter?	1	1	https://issues.jboss.org/browse/PRESSGANG-36
16161	PRESSGANG-22	Hi Robb I 100% agree with you on this. I've seen this very issue in multiple places in the Enterprise versions of documentation. For example, in the EAP 5.1 Security Guide, there were heaps of "edit the jboss-service.xml file". Which one? Fixing this is a matter of going through each document and tying up the loose ends. We are doing this progressively in the enterprise documentation, but I'm not sure what is happening upstream. Our solution is putting the absolute file location from the JBoss installation directory. While making some sentence a little more verbose, it makes the file location crystal clear to the reader, and that after all is what user documentation is all about. Do you think it would be useful to include a section in the JBoss Documentation Guide about how to declare file locations in JBoss User Documentation (both enterprise and community)? I'm sure it wouldn't hurt. Cheers Jared	1	0	https://issues.jboss.org/browse/PRESSGANG-22
16162	PRESSGANG-21	Robb Does this relate to JBoss documentation, such as EAP? That is how I interpreted the ticket. The Middleware Docs team is fixing this issue as they discover it while fixing surrounding text for JIRAs, and when a guide is nominated for a cover-to-cover rebase. If the question relates to JBoss user guides, and you're not sure where to raise the bug against, please create a JIRA against the JBDOCS project. I can route it to the correct area for you. Cheers Jared	1	0	https://issues.jboss.org/browse/PRESSGANG-21
16163	PRESSGANG-16	Looks like there are 3 related repository's: - docbook-support: https://svn.jboss.org/repos/jbossas/projects/docs/docbook-support - pressgang (the JBoss documentation guide): https://svn.jboss.org/repos/pressgang/ - jdocbook plugin (the jdocbook plugin): https://svn.jboss.org/repos/maven/plugins/jdocbook/maven-jdocbook-plugin/trunk/ Not sure where the jdocbook plugin docs are hosted. Doesn't look to be in either of these. Is there any reason why these 3 repository's can't be consolidated?	1	1	https://issues.jboss.org/browse/PRESSGANG-16
16164	PRESSGANG-14	Hi Josh A bit of time has elapsed since this ticket was raised. Do you still think this information is accurate for our Audience positioning information? Cheers Jared	1	0	https://issues.jboss.org/browse/PRESSGANG-14
16165	PRESSGANG-7	Hi Steve Is maven-jdocbook-plugin 2.2.2 ready to roll yet? Just want to make sure I update the PressGang JBoss Documentation Guide with the correct version. Cheers Jared	1	1	https://issues.jboss.org/browse/PRESSGANG-7
16166	PRESSGANG-5	Hi Josh I wonder how relevant this will be now that Mark and Vlastimil have created the Project Documentation Editor? Because this procedure in unlikely to be followed by a community contributor, this may be something useful to add to our ECS Docspace rather than mention in the JBoss Docs Guide. What are your thoughts on this? Cheers Jared	1	0	https://issues.jboss.org/browse/PRESSGANG-5
16167	ABDERA-437	Abdera is in maintenance mode, there's not much active development going on but reported bugs do get fixed. I suppose we could/should do another release to catch up with the bugs that have been fixed in the trunk code, thats not happened mainly as users haven't been pushing for it - is a release important for you? How important is the httpclient upgrade to you - if we did a new Abdera release must it also have that httpclient version update?	1	1	https://issues.apache.org/jira/browse/ABDERA-437
16168	ABDERA-437	Thanks ant for your update! What we are concerning are: whether current Abdera or new Abdera to be adotped in our project is good enough to fix known issues after no release for over 3 years, whether new bug would be resolved in time if there is in future. For httpclient, since replaced by HttpComponents, will new bug(if any) about old httpclient be fixed if build several years ago is still kept? In my opinion, better to turn to latest HttpComponents to make sure all parts of Abdera are in maintenance and move forward, then users would be more willing to use it. Your thoughts?	0	0	https://issues.apache.org/jira/browse/ABDERA-437
16169	ABDERA-418	The definition of "Blocker" is: "Blocks development and/or testing work, production could not run". Can you explain why this issue meets that criteria, and in particular why you are unable to override the dependency in your project?	1	1	https://issues.apache.org/jira/browse/ABDERA-418
16170	ABDERA-287	Well that looks interesting James. What do you want to happen with this now - how would it be integrated into Abdera? (and just to remind, you do still have commit access here)	1	0	https://issues.apache.org/jira/browse/ABDERA-287
16171	ABDERA-287	Well, it's an update for the existing uri template impl that's already there. For now, unless there's major reason to get it into trunk, keeping the patch available in jira is sufficient I think. People who want to play around with it can patch their source. Fwiw, I've been playing around with a significant update to the i18n module, fixing bugs, improving performance, and finally getting around to the ICU support for the unicode stuff. When I'm done with that i'll submit the patch for that as well. https://issues.apache.org/jira/browse/ABDERA-287?page=com.atlassian.jira.plugin.system.issuetabpanels:comment-tabpanel&focusedCommentId=13090162#comment-13090162] now - how would it be integrated into Abdera? http://tools.ietf.org/html/draft-gregorio-uritemplate-06) ---------- URI Templates specification. implementation. The URI Template spec has changed significantly. {.list*}{/list*}{?foo,var,hello}{&half,x,y}#{var}"); http://www.red.green.blue/red/green/blue?foo=That%27s%20right%21&var=value&hello=Hello%20World%21&half=50%25&x=1024&y=768#value	0	0	https://issues.apache.org/jira/browse/ABDERA-287
16172	ABDERA-278	Could you provide a patch of what you'd like the update manifest to look like?	1	1	https://issues.apache.org/jira/browse/ABDERA-278
16173	ABDERA-278	I've committed a fix to this to trunk and included it in the upcoming 1.1.2 release, it would be great if you could verify if this fixes problem for you. The trunk artifacts are published to the snapshot repo as version 1.2-SNAPSHOT or the 1.1.2 release candidate artifacts are at http://people.apache.org/~antelder/abdera/1.1.2-RC2/	1	1	https://issues.apache.org/jira/browse/ABDERA-278

#	Requirement	Questions	Answered	Successfully Answered	URL
16174	ABDERA-267	Abhishek's analysis is correct, and I would like to add some more explanations (wearing my Axiom developer hat): * Some background information about the isSetPrefixBeforeStartElement thing can be found in [1]. It is actually not Axiom that got it wrong, but a particular version of a particular StAX implementation. In Axiom 1.2.9, we isolated that code into what we call a StAX dialect so that it is only ever triggered when that particular StAX implementation is used. * On the other hand, the performance issue related to isSetPrefixBeforeStartElement was already addressed in 1.2.8 (see WSCOMMONS-325). So upgrading to that version instead of 1.2.9 may provide a quick fix for the issue. * In Axiom 1.2.9, the factories returned by StAXUtils are indeed immutable. The reason is that these factories are cached and therefore shared with other frameworks using Axiom. E.g. if Abdera and Axis2 are used in the same application, they would get the same factory instances from Axiom. Therefore we can't allow modifications of these factory instances, because this has the potential of causing subtle issues. In 1.2.9, we also introduced new features that allow to customize the factories in a controlled way, but for XMLOutputFactory instances, this is only implemented in the current trunk. * Since Abdera extends Axiom implementation classes (namely the LLOM implementation), it is indeed strongly coupled and therefore very sensitive to changes in Axiom. Probably the best way to avoid these issues is to have the Abdera trunk depend on the Axiom trunk so that incompatibilities are detected early by the Abdera build in Hudson. I will see what needs to be done in the Abdera and Axiom code to make them again play nicely together. [1] http://markmail.org/thread/37y3qjcfucb6756o	1	1	https://issues.apache.org/jira/browse/ABDERA-267
16175	ABDERA-267	Thanks both of you for for working on this issue, i've applied the patch to Abdera trunk in r1006114. We need to get this and a couple of other fixes out in an Abdera release but wont be able to do that till an Axiom release is done so Abdera can used a non-snapshot release. When do you think an Axiom release is likely to happen? (lets leave this jira open till the release is done)	1	1	https://issues.apache.org/jira/browse/ABDERA-267
16176	ABDERA-236	Pardon my complete lack of knowledge about OSGi matters, but would the following: - <packaging>jar</packaging> + <packaging>bundle</packaging> imply that JARs are not created anymore? I guess not.	1	1	https://issues.apache.org/jira/browse/ABDERA-236
16177	ABDERA-214	we already have a RSS extension, can you give us more details?	1	1	https://issues.apache.org/jira/browse/ABDERA-214
16178	ABDERA-214	Is there any progress on this JIRA ? I'm interested in consuming these in Apache Tuscany RSS Binding.	0	0	https://issues.apache.org/jira/browse/ABDERA-214
16179	ABDERA-188	Ok, I'll try to fix that diff problem and let you know. In the meantime, given that my implementation is a drop-in replacement to the current one, may you try to completely replace current source files with the ones contained into the V3 zip file? Thanks!	0	0	https://issues.apache.org/jira/browse/ABDERA-188
16180	ABDERA-188	I've tried to fix the diff file, but it requires too much manual modifications, which I think are error-prone. I think it's better to apply the diff as it is, skipping not found files, and then manually copy the following files from the V2 zip file: src/test/resources/atomResponse.xml src/main/java/org/apache/abdera/ext/opensearch/model/Query.java src/main/java/org/apache/abdera/ext/opensearch/model/IntegerElement.java src/main/java/org/apache/abdera/ext/opensearch/model/OpenSearchExtensionFactory.java And finally delete: src/main/java/org/apache/abdera/ext/opensearch/Query.java src/main/java/org/apache/abdera/ext/opensearch/IntegerElement.java src/main/java/org/apache/abdera/ext/opensearch/OpenSearchExtensionFactory.java What do you think?	0	0	https://issues.apache.org/jira/browse/ABDERA-188
16181	ABDERA-188	Hi guys, have you made any progress with this? Any chance to get this into trunk? Thanks!	0	0	https://issues.apache.org/jira/browse/ABDERA-188
16182	ABDERA-185	I introduced the NoOpTransaction in order to remove boiler-plate null checking and make code more readable: however, it is not strictly needed. Talking about the processor classes, do you want me to move them to another specific package and submit another diff file? I'm happy you appreciated my work: let me know how to proceed. If you'll commit my changes, I'll start working at improving OpenSearch support by using request processors. Thanks.	1	1	https://issues.apache.org/jira/browse/ABDERA-185
16183	ABDERA-182	There are other patch that adds support for using the requirements in the Route.match: https://issues.apache.org/jira/browse/ABDERA-139 Take a look at the patch and if you agree with it I could add them.	1	1	https://issues.apache.org/jira/browse/ABDERA-182
16184	ABDERA-182	I've looked at 139's requirements patch, the only issue i have with it is it doesn't let me do what i want with the requirements. It's a way to filter on your variables that are matched to path segments. (and it appears this is how it works in Python routes). However, I want to set a requirement on a url param being present, which is after the ? and so not part of the URI in the case of the patch in 139. This is why I put in generic accessor methods. Then I use the requirements during the resolve.	0	0	https://issues.apache.org/jira/browse/ABDERA-182
16185	ABDERA-182	This seems pretty non-controversial, since it doesn't change behavior, just makes some data accessible. Can I get a commit on this one? I'd like to use this feature in the project I'm working on and other workarounds have not panned out. thanks	0	0	https://issues.apache.org/jira/browse/ABDERA-182

#	Requirement	Questions	Answered	Successfully Answered	URL
16186	ABDERA-168	afin de traiter automatiquement un filtre par categories * pour les adapteurs qui n'implante pas le support des catégories. * * Si on ne le faisait pas, un adapteur ignorerait simplement les catégories * passées en paramètres. * * Un adapteur retournera un 400 automatiquement si le support des catégories * est à false, sans avoir à ce soucier de ce support dans le dao associé à l'adapteur. * * De plus, on en profite pour ajouter automatiquement les liens pour le paging. * * @see #getHandlesCategories() */ @Override protected void addFeedDetails(Feed feed, RequestContext request) throws ResponseContextException { // Y a-t-il au moins une categorie sur l'URL? if (request.getTarget().getParameter("category1") != null) { // Il y a des categories dans l'URI de la requete... if (!getHandlesCategories()) { // L'adapteur ne supporte pas les categories. On bypass le traitement normal. ServiceContext context = getServiceContext(request); context.getGenericErrors().reject(BaseErrorCode.REST_REQUEST_CATEGORIES_NOT_SUPPORTED.toString(), "Cet adapteur ne supporte pas les catégories."); checkForErrors(context, request); } } // TODO:RG Devrait utiliser un hook du genre afterGetEntries() plutôt // que de réimplanter complètement addFeedDetails(). // Ajouter automatiquement un lien next page pour le paging si le nombre d'entrées // dans le feed est un de plus que ce qui devait être retourné. // La méthode getServiceContext() a modifié cette valeur pour que l'adapteur // charge une entrée supplémentaire. Donc, si cette entrée est présente dans // le feed, cela indique qu'une prochaine page est disponible. feed.setUpdated(new Date()); Iterable<T> entries = getEntries(request); ServiceContext context = getServiceContext(request); int inflatedMaxResult = context.getMaxResults(); // On corrige l'info de paging dans le ServiceContext. context.setMaxResults(inflatedMaxResult - 1); boolean needNextPageLink = false; int collectionSize = 0; if (entries != null) { for (T entryObj : entries) { // Detection de la presence d'une prochaine page. ++collectionSize; if (collectionSize >= inflatedMaxResult) { needNextPageLink = true; // Ne pas ajouter cette dernière entrée. break; } Entry e = feed.addEntry(); IRI feedIri = new IRI(getFeedIriForEntry(entryObj, request)); addEntryDetails(request, e, feedIri, entryObj); if (isMediaEntry(entryObj)) { addMediaContent(feedIri, e, entryObj, request); } else { addContent(e, entryObj, request); } } } int currentStartIndex = context.getStartIndex(); // Ajout d'un lien premiere page? if (currentStartIndex > 1) { FeedPagingHelper.setFirst(feed, createPagingLink(request, 1)); } // Ajout d'un lien page précédente? if (currentStartIndex > 1) { int newStartIndex = currentStartIndex - context.getMaxResults(); if (newStartIndex < 1) { newStartIndex = 1; } FeedPagingHelper.setPrevious(feed, createPagingLink(request, newStartIndex)); } // Ajout d'un lien page suivante? if (needNextPageLink) { int newStartIndex = currentStartIndex + context.getMaxResults(); FeedPagingHelper.setNext(feed, createPagingLink(request, newStartIndex)); } // Un lien derniere page n'est jamais ajouté étant trop couteux à calculer. } /** * Génère un lien de paging pour insertion dans le feed par l'appelant. * * @param startIndex Le nouveau start-index. * @return Un lien absolue. */ private String createPagingLink(RequestContext request, int startIndex) { String uri = request.getResolvedUri().toString(); int separatorIndex = uri.indexOf("?"); if (separatorIndex != -1) { uri = uri.substring(0, separatorIndex); } StringBuilder link = new StringBuilder(uri); link.append("?").append(SearchConstants.START_INDEX).append("=").append(startIndex); for(String parameterName : request.getParameterNames()) { if (!parameterName.equals(SearchConstants.START_INDEX)) { String parameterValue =	1	0	https://issues.apache.org/jira/browse/ABDERA-168
16187	ABDERA-168	You could use a URI Template to do this by setting the template pattern and passing in the current uri parameters in the context with the appropriate changes for the page. e.g. something like: Template template = new Template("?{-join|&|a,b,c,d,page}"); Map<String,Object> context = new HashMap<String,Object>(); context.put("a", request.getParameter("a")); context.put("b", request.getParameter("b")); context.put("c", request.getParameter("c")); context.put("d", request.getParameter("c")); context.put("page", 2); String queryString = template.expand(context); you can then append the expanded querystring to the base request uri	0	0	https://issues.apache.org/jira/browse/ABDERA-168
16188	ABDERA-129	Applying this patch breaks the ant build. Can you take another look and make sure we can get a clean build	1	1	https://issues.apache.org/jira/browse/ABDERA-129
16189	ABDERA-106	The patch does not appear to line up with the current code in trunk and I don't know enough about spring to fix it up myself. Can you please take another look at the patch?	1	1	https://issues.apache.org/jira/browse/ABDERA-106
16190	ABDERA-104	I'm confused... getId() is for the feed ID. Do you mean getHref? I'm still a little fuzzy as to what you mean. Can you expand on the problem?	1	1	https://issues.apache.org/jira/browse/ABDERA-104
16191	ABDERA-104	Went back to RFC4287. I was missusing the getId() method. I now understand the difference between the atom:link@rel=self and the atom:id tags. However, I would like some pointers on providing feed ids... Do you recommend using a uuid, a guid or... where can I get pointers on the tag: constructs used in the unit tests? I can see the use of a feed id when building a generic adapter for a generic feed server and using the id to map into your feed table. However, I'm building an Abdera server over an existing application and the relation between the adapter and the database content is obviously hard coded in my adapters. I really have no need for the feed id. Should I just provide a filler value? Thanks again!	1	1	https://issues.apache.org/jira/browse/ABDERA-104
16192	ABDERA-97	I think this patch should work. Compiles .. all tests pass. Yesterday's break was due to not cleaning the build before compiling and running the tests. Can you please have a look at this.	1	0	https://issues.apache.org/jira/browse/ABDERA-97
16193	ABDERA-56	Was just wondering - are there still plans to integrate this into Abdera? (Not trying to rush you here, just don't want it to get out of date and fall off the roadmap)	1	0	https://issues.apache.org/jira/browse/ABDERA-56
16194	ACCUMULO-4673	Pull request has been merged. Is this done?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4673
16195	ACCUMULO-4658	[~dlmarion], can you add a brief description about this issue, to give the change some context?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4658
16196	ACCUMULO-4647	Can this be marked as resolved?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4647
16197	ACCUMULO-4644	Should this be closed?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4644
16198	ACCUMULO-4643	I was thinking about the use case of an iterator that does some type of transform. If not handled properly, this feature could lead to that iterator being reseeked with an untransformed key from an iterator below it. Where normally its only reseeked with transformed keys. For option #1, was the idea to add a interrupt boolean field to Key (like the delete boolean)? If so, then the iterator doing transformation would have to ensure it sets the interrupt field on the transformed key. For option 2, any iterator doing transformations should catch the exception, transform the key, and then thrown a new exception with the transformed key.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4643
16199	ACCUMULO-4643	[~ivan.bella] for your PR, what made you decide on option #2 over option #1?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4643
16200	ACCUMULO-4643	Whats the expected/desired behavior of this feature w.r.t. isolation? When an iterator yields and is later continued, will it be continued with the exact same data sources? Or could it be restarted with a different set of data sources (in which a compaction could have occurred or new data was added)?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4643

#	Requirement	Questions	Answered	Successfully Answered	URL
16201	ACCUMULO-4643	I created a [test suite|https://github.com/keith-turner/yield-test] and ran the following test. Test 1 : 128 tserver threads, 127 non-yielding long running scans, 1 thread doing 50 batch scans of 5 random ranges. Below are the times in ms for the batch scans. There were 5,000,000 key/values. Each long runnning scan was reading all. The total time for all long running scans was : 104 seconds {noformat} min: 30.0 max: 2395.0 mean: 882.3599999999999 standard deviation: 653.56063254159 {noformat} Test 2 : 128 tserver threads, 127 yielding long running scans, 1 thread doing 50 batch scans of 5 random ranges. The long running scans yielded every 10,000. Below are the times in ms for the batch scans. Total time for all long running scans was : 215 seconds {noformat} min: 428.0 max: 827.0 mean: 626.2800000000002 standard deviation: 104.54157263100298 {noformat} Test 3 : 16 tserver threads, 20 long running scans, 1 thread doing 50 batch scans of 5 random ranges. Below are the times in ms for the batch scans. There were 31,750,000 key/values. Each long runnning scan was reading all. The total time for all long running scans was : 174 seconds {noformat} min: 120.0 max: 548.0 mean: 210.54000000000002 standard deviation: 70.64345948031524 {noformat}	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4643
16202	ACCUMULO-4643	Can this issue be closed, now that it has been merged into master? Is there more work to be done?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4643
16203	ACCUMULO-4642	bq. However, I think we can get there incrementally, by starting with eliminating the SystemConfiguration.getInstance() method. Are you referring to the AccumuloConfiguration object returned from a call to ServerConfigurationFactory.getSystemConfiguration() ? I can't find any SystemConfiguration class...	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4642
16204	ACCUMULO-4626	bq. When a single iterator tree references the same RFile blocks in different branches we sometimes get cache misses for one iterator even though the requested block is held in memory by another iterator. Have you figured out why this happens in the first place? If two iterators are reading from the same RFile, I would expect the block cache to contain the blocks for that file after the first iterator accesses it. Why are we getting the cache misses in the first place? Some kind of race condition where the block is not yet in the cache?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4626
16205	ACCUMULO-4626	Thanks for the explanation, Adam. bq. the sum of sizes of the referenced blocks across all of the concurrently running queries exceeds the 25% or so of the total cache that is reserved for single-use blocks That seems really aggressive in terms of eviction to me. Are we getting poor cache utilization because of that? Maybe there's some other characteristic which keeps more-often accessed blocks in cache? I'm trying to get a better understanding (admittedly without yet pulling up the code) about how this would affect more real-life workloads.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4626
16206	ACCUMULO-4620	bq. It would be great if all Accumulo modules were consolidate into a modules directory to put every module in one directory and reduce the number of directories in the root project directory What does this get us? I don't understand what value having fewer directories at the root of the repository provides.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4620
16207	ACCUMULO-4620	I don't understand the benefit here either. I see your PR is just moving everything into a modules/ directory. Can you explain what you are trying to fix and how this will accomplish that?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4620
16208	ACCUMULO-4620	bq. I haven't heard any actual reasons why this change will be disruptive. It is disruptive because it will cause the active developers to change how they access the filesystem. It's yet another thing to keep in mind as I'm doing command-line operations in Accumulo (based on the branch). My objection does not extend farther than I do not think it is confusing to have many modules, nor do I find the existing server directory confusing. I just disagree with the justifications/reasons for moving the modules in the first place. Anyways, I don't care to participate in argument/discussion about a directory -- my "-0" is all I really care to give. If others feel strongly that this should be done, you have the ability to proceed (my -0 is not a -1).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4620
16209	ACCUMULO-4614	Should that be a debug or info log? If it's just a one-shot load, INFO, might be okay. Otherwise, I'd suggest DEBUG.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4614
16210	ACCUMULO-4614	This has been merged. Is it done? Can this issue be closed, [~mikewalch]?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4614
16211	ACCUMULO-4609	Individual k/v pairs are not inspected during a bulk import. Data is not iterated over during this operation. If I understand your request correctly, it seems you're looking for the ability to perform some key/value filtering/transformation during first scan or major compaction after a file is bulk imported. is that correct? I think this is probably already possible with the existing scan/majc scopes. Are these insufficient?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4609
16212	ACCUMULO-4596	All the PRs have been merged. Is this issue complete or is there more subtasks to be done?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4596
16213	ACCUMULO-4584	[~elserj], mind taking a look at this? If we can remove these checks, any ideas on how to update the RpcWrapperTest to verify the correct behavior? The question is: is it better to wrap exceptions from oneway methods with TException like all the rest (effectively reverting ACCUMULO-4065) and have thrift drop them, or is it better to use reflection to figure out which methods are oneway and pass those through (keeping ACCUMULO-4065) unwrapped?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4584
16214	ACCUMULO-4584	bq. wrap exceptions from oneway methods with TException like all the rest (effectively reverting ACCUMULO-4065) and have thrift drop them I think the proper fix is to have Thrift handle this and for us to remove this work-around. However, having confidence that Thrift doesn't regress on this would be good (I'm cringing at having to debug this one again..). bq. any ideas on how to update the RpcWrapperTest to verify the correct behavior The only reasonable way I can think to try to verify this is to completely stub out the entire RPC pipeline. Along the lines of what is presently there in the test class now ({{foo_args}}, {{FakeServiceImpl}}, {{fake_fields}}), we could extend that to be a real end-to-end test that uses Thrift (instead of just mocking out the InvocationHandler). Maybe it would be easier in the long run to just write a more tightly-scoped unit test for RpcWrapper and create a new test that does a standard Client/Server setup for Thrift. We should be able to make a dumb IDL (with a oneway method that always throws an exception and a non-oneway method that returns a value), create a client and server, and then call the oneway method and the non-oneway method using the same connection. Does that make sense?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4584
16215	ACCUMULO-4532	I see a patch in the master branch for this. Is it done? Can it be closed?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4532
16216	ACCUMULO-4531	I see some patches to the master branch for this issue. Is it done? Can this be closed?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4531
16217	ACCUMULO-4530	More directly, is this one done?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4530
16218	ACCUMULO-4522	I see commits on 1.7, 1.8, and master branches. Is this done?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4522

16220	ACCUMULO-4500	bq. we should limit the feature to be a mapping of names (type: String) to counts (type: signed Long) :coughs: That... is a histogram. Label (string) on x-axis, numeric value on the y-axis. What is this aversion to using the word "histogram"? I honestly don't understand the desire to avoid using that word. bq. I think it would be a good idea that when this information is exposed in the client API, it should be retrievable through a user-supplied aggregation/combiner function Can you sketch what you think this should look like? It's not entirely clear to me. bq. The reasoning for this is that client code doesn't normally deal with things at the granularity of files, but rather, the granularity of tablets, ranges, and tables Keith had made a good point elsewhere that, when files overlap tablets, we might double-count. That, combined with the counting (presently) not included on the IMM, these "counters" (winks) would not be 100% accurate. Personally, I think that's OK. bq. A summation function would probably be the most common, but certainly not the only useful aggregation function. Example of another aggregation function?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4500
16221	ACCUMULO-4500	bq. :coughs: That... is a histogram. I disagree. A histogram is a diagram... a particular kind of data visualization. Computer scientists overload the term to mean to mean the data structure to power such a visualization, and that's fine, but that's not even what we have here. A histogram has particular semantics where different values of a single variable are on one axis, and the frequency of those values are shown on the other. What we have here is more general than even that, because we're not necessarily referring to a single variable, nor do the magnitudes necessarily represent frequencies or anything like frequencies. Calling it a histogram implies semantics we don't necessarily need to impose. bq. Can you sketch what you think this should look like? It's not entirely clear to me. Something like: {code:java} public NamedCounters getCounters(Range range, Function<Long, Long> combiner); {code} bq. Keith had made a good point elsewhere that, when files overlap tablets, we might double-count. That, combined with the counting (presently) not included on the IMM, these "counters" (winks) would not be 100% accurate. Personally, I think that's OK. I agree. bq. Example of another aggregation function? Here's some: https://en.wikipedia.org/wiki/Aggregate_function I could think of others.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4500
16222	ACCUMULO-4500	Re passing in an instance of a Function, how can we run the function on remote JVMs? We could take the class name from the instance and use that to instantiate on remote JVMs. The following are two possible issues with taking the class name from the instance. * Anonymous inner classes (AIC) : If the user passes in Foo$1, it could be that the same AIC is Foo$2 on a remote JVM. This could happen when running a slightly different version of the code on the remote. Also if the Anonymous inner class is not static, could be tricky to instantiate on remote JVM. * Lambdas : Are not inner classes[1]. I have no idea if you can safely serialize[2] lambdas between class files generated from different versions of code??? I have wanted to look into what Spark does, but have not had a chance to dig into the details. I strongly suspect Spark can make certain assumptions based on the fact that all JVMs are running the exact same version of user code. In this case its reasonable to expect an AIC to have the same name across JVMs. I don't think we should assume Accumulo client and server processes are running the exact same version of user code. It seems given our circumstances that using a class name instead of an instance would be safer. I suppose we could just dissallow AICs (throw an exception). Not sure about lambdas. [1]: https://www.infoq.com/articles/Java-8-Lambdas-A-Peek-Under-the-Hood [2]: https://docs.oracle.com/javase/8/docs/api/java/lang/invoke/SerializedLambda.html	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4500
16223	ACCUMULO-4500	That was just a quick mock-up, not the actual suggested implementation. That mock-up wouldn't work anyway, because it's actually a list of Longs to map to a Long. But, then there's also the question... should this function be able to change behavior based on the counter name? Should it be able to emit new counters (like a many-to-many transformation) or just reduce? I don't know if we could do serialized lambdas or if we'd have to pass the class name, but you're right: The aggregation function will need to be available on both the client and the server side, because some aggregation might occur within the tserver, and some between tservers in the client. Maybe those should be two separate aggregation opportunities? Should our API only reflect in-cluster aggregation, and client code has to do its own cross-tserver aggregation because we'll just provide a stream? I don't know. I just know it'd be nice to put some serious thought into what any new API is going to look like... and based on a solid understanding of what features we're trying to provide at the most basic level.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4500
16224	ACCUMULO-4500	bq. A histogram has particular semantics where different values of a single variable are on one axis, and the frequency of those values are shown on the other. What we have here is more general than even that, because we're not necessarily referring to a single variable, nor do the magnitudes necessarily represent frequencies or anything like frequencies. Calling it a histogram implies semantics we don't necessarily need to impose. I really don't want to get into an argument over semantics. bq. What we have here is more general than even that, because we're not necessarily referring to a single variable I don't know this means. {code} public NamedCounters getCounters(Range range, Function<Long, Long> combiner); {code} I still don't understand what the {{Function<Long,Long>}} is accomplishing. Combination of numbers is (typically) addition. Why do we need a function here? Also, this doesn't let me fetch just the visibility data. If there are multiple types of counters stored in the rfiles, how do I refer to just one? How do I know which exist for some table? bq. Re passing in an instance of a Function, how can we run the function on remote JVMs? We could take the class name from the instance and use that to instantiate on remote JVMs This is 110% what I wanted to avoid. What was suggested as a *simple* database primitive is now being exploded into a "wholly generalized user-configured framework". I have no interest in working on that. If either of you do, I'm happy to help sketch out such a system, but I will lose all interest in building this simple feature if it's being stipulated that I have to build something so largely different to build the proposed *simple* feature.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4500
16225	ACCUMULO-4493	Do you know if it's possible to renew outside the shell process to get things going again for a long-running shell?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4493
16226	ACCUMULO-4493	bq. Do you know if it's possible to renew outside the shell process to get things going again for a long-running shell? It.. should be. I don't think I've ever tried to do this, but we should have access to the ticket cache (either in the default location or via the {{KRB5CCNAME}} environment variable), which should be all that we need. There is a call {{UserGroupInformation#reloginFromTicketCache()}}, but I'm not sure how (if at all) UGI would know about the ticket in the ticket cache (from the kinit). Might be some sort of disconnect since it's essentially found automatically by JAAS (instead of explicitly logged-in by the Accumulo shell). bq. Users should be able to launch the shell in a kerberos deployment using a keytab. So really, we're just adding another argument to the shell to let the user provide a keytab and then do a normal login+renewal? Makes sense.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4493

#	Requirement	Questions	Answered	Successfully Answered	URL
16227	ACCUMULO-4487	bq. I don't think we should try to find an Accumulo-specific build solution for this sort of thing, though +1 to a long-term upstream fix. How do you feel about a stop-gap until such an upstream feature could be committed/released, Christopher? My initial reaction was that I'd like to see us _not_ in this department, but I think the debt we would incur would be relatively small. [~cheng xu], have you reached out to the user@maven.apache.org list to see if there is some (perhaps, poorly documented) feature which could do what you've suggested here?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4487
16228	ACCUMULO-4481	in a related note, have we documented that upgrades from 1.5 and earlier to 1.8 and later isn't possible? I don't see anything in the 1.8.0 release notes nor the [1.8 user guide's section on upgrade issues|http://accumulo.apache.org/1.8/accumulo_user_manual#_upgrade_issues], for example.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4481
16229	ACCUMULO-4481	Isn't the LocalWALRecovery tool expressly mentioned in our user facing docs? we'll need to make sure those docs are clear about what version(s) the tool can be used in (IIRC this is already the case, but we should verify).	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4481
16230	ACCUMULO-4479	{quote} This is prone to being overlooked and forgotten. We should have generic version-agnostic information in UPGRADING.md, and put more specific per-release notes in an UPGRADING section on the release notes for specific upgrade issues. At the very least, the version of this document for the current release does not need to contain upgrade instructions for upgrading to previous releases. {quote} counter-point: if we don't support direct upgrades from all older versions to all newer versions, having a dedicated upgrade doc makes it much easier for folks who have to go through multiple upgrades, e.g. to get from version 1.4 to 1.8. If we're going to rely on release notes, will that mean that each maintenance release will need to preserve an "upgrade considerations" section from the .0 release? Are we going to retroactively change the release notes for 1.5, 1.6, and 1.7 to include this information?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4479
16231	ACCUMULO-4479	Ok, I put a PR up for upgrade notes before I understood what Christopher meant. My concern here is that it was too easy to miss including upgrade notes for the 1.8.0. I am going to remove the UPGRADING.md file from all branches. All future releases should include upgrading notes in their release notes. I may back port upgrade notes to the 1.8.0 release notes as well.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4479
16232	ACCUMULO-4468	Hi [~wmurnane]. Thanks for the patch. bq. This functions correctly, of course, but one of the typical uses of this method is to compare adjacent rows to break them into larger chunks. For example, accumulo.core.iterators.Combiner repeatedly calls this method with subsequent pairs of keys. Do you have other examples of where this might be used in a tight loop? bq. This (marginally) improves the speed of comparisons in the relatively common case where only the last part is changing, with less complex code. How did you test this? What types of numbers did you see? {code} + case ROW: + if (!isEqual(row, other.row)) + return false; + break; default: throw new IllegalArgumentException("Unrecognized partial key specification " + part); } + return true; {code} Why not consolidate this to: {code} case ROW: return isEquals(row, other.row); {code}	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4468
16233	ACCUMULO-4468	bq. Do you have other examples of where this might be used in a tight loop? I think there are lots of other examples in Accumulo itself; for example, in iterators.system.DeletingIterator and iterators.user.TransformingIterator, this method is called in a loop. In our use case, we're doing a similar thing: building a larger object out of multiple rows, by finding groups of rows which are equal under ROW_COLFAM. When each object is built from only a few rows, the CF equality comparison returns false pretty often (which is to be expected), but only after comparing row IDs, which are always the same in practice. bq. How did you test this? What types of numbers did you see? I haven't been able to install it on a cluster to test. The test suite does pass with this patch applied. I think it's a minor change; in the "rows are equal" case the same amount of work is done as with the existing code, although the parts are accessed in the opposite order. They're still compared mostly-in-order, as isEqual does, but the comment in that function was inspiration to try reversing the comparison order. Aside from performance, the code seems cleaner to me: there's no more repetition of e.g. the check of row equality. The bytecode (with Oracle javac 1.8.0_92) is substantially smaller: 389 bytes versus 167. bq. Why not consolidate this to: That's fine with me. I just wrote all the cases to look the same, instead of having a "special case" for the last comparison made. If some special work were required in the compare-equal case, it could go before the return statement.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4468
16234	ACCUMULO-4468	Hi [~wmurnane]. Thanks for the patch! After reviewing, I had a few comments: # This may speed things up only if the probability of not being equal is greater in the lower dimensions of the key than the higher ones. I'm not sure this is the case, as I don't have a strong sense of when this method is called, or how frequently. What analysis have you done to determine these relative probabilities? # Have you run any experiments to determine the performance differences in various use cases? # If this method is primarily used in user code, would a new method to compare in reverse order be better, to account for both cases? Perhaps it'd be better to optimize the Combiner code, rather than change the default behavior for all cases? # I think relying on fall-through behavior in switch statements should be avoided. It's prone to error, especially as code is refactored over time. I think it's better to avoid it than to suppress the warning. This may be a style choice, but it's a preference that the java compiler weighs in on (by making fallthrough a default compiler warning), and I'd prefer to avoid behavior which results in compiler warnings whenever possible.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4468
16235	ACCUMULO-4468	{quote} bq. Do you have other examples of where this might be used in a tight loop? I think there are lots of other examples in Accumulo itself; for example, in iterators.system.DeletingIterator and iterators.user.TransformingIterator, this method is called in a loop. In our use case, we're doing a similar thing: building a larger object out of multiple rows, by finding groups of rows which are equal under ROW_COLFAM. When each object is built from only a few rows, the CF equality comparison returns false pretty often (which is to be expected), but only after comparing row IDs, which are always the same in practice. {quote} Perhaps my concern didn't come across. From my perspective: I am concerned with a performance change that makes one case better. We need to understand if the case you outlined is "the norm" or "the exception". I was hoping you had context on this. {quote} bq. How did you test this? What types of numbers did you see? I haven't been able to install it on a cluster to test. The test suite does pass with this patch applied. I think it's a minor change; in the "rows are equal" case the same amount of work is done as with the existing code, although the parts are accessed in the opposite order. They're still compared mostly-in-order, as isEqual does, but the comment in that function was inspiration to try reversing the comparison order. Aside from performance, the code seems cleaner to me: there's no more repetition of e.g. the check of row equality. The bytecode (with Oracle javac 1.8.0_92) is substantially smaller: 389 bytes versus 167. {quote} At risk of being anti-social, I am -1 on any change for performance without numbers coming with it. There are many great tools out there to benchmark changes and don't necessarily require use of a cluster (it might actually be harder to test on a cluster). [JMH|http://openjdk.java.net/projects/code-tools/jmh/] and [Google Caliper|https://github.com/google/caliper] are two good tools for micro-benchmarking.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4468

#	Requirement	Questions	Answered	Successfully Answered	URL
16236	ACCUMULO-4468	Great stuff, [~wmurnane]! A few thoughts: bq. the original equals() copied to the new class is called customVanilla, and the original equals() in the original Key class is called standardEquals. The numbers to compare are really the two custom* ones; the standardEquals value is given just to show that it's in the same ballpark. I'm not grok'ing the difference between customVanilla and standardEquals. Why the variance in these two? Shouldn't they be essentially equivalent? bq. As a user of the API, I'd rather not have to think about equalsForward() versus equalsBackward(). I concur with you here. bq. I agree that any change should start with prejudice against it. However, I think the numbers above prove my case: when keys are presented in sorted order, which happens often in Accumulo, the proposed method of comparing is slightly but noticeably faster. The degree of improvement depends on the data, but it doesn't perform worse than the current solution in any case that I tested. Great, I hoped you didn't take my initial prejudice badly :). This is a great start. I'm curious trying to tweak a couple of other things. Sharing your project was super useful. Ultimately, if these numbers are as they appear (better in some cases, no worse in others), this is a great improvement. Expecting large contiguous blocks of keys where row or row+cf change very infrequently makes sense to optimize. It appears that {{compareTo(Object}} is also using a separate code path, so I don't think this would have a big affect on things like creating RFiles for bulk imports. I need to search through usages though.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4468
16237	ACCUMULO-4468	[~kturner], what do you think we should do here?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4468

16239	ACCUMULO-4456	[~elserj] I'm not sure I fully understand what the replication service is doing, but it's possibly different. There seem to be 3 layers of service wrappers here. I didn't see that everywhere else. Does your comment imply that my fix was correct, or that I missed something?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4456
16240	ACCUMULO-4455	Just to clarify (since I asked), my intent was not specifically automated tests (since multi-threaded things are often hard to codify). I believe [~ivan.bella] said that he was primarily testing 1.6.x with [~phrocker] expressing some concerns about changes in newer versions of Accumulo. It would be nice that, for whatever methods were used to identify the problem and verify the fix, they are repeated for the other active releases (expressed in the fixVersions) that this change also landed on. [~ivan.bella], would you have the cycles to take this on?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4455
16241	ACCUMULO-4453	Hey [~dlmarion], it looks like you introduced these new logging messages in https://github.com/apache/accumulo/commit/2c88388995310 80adfdb33ba75f25f4cdd643963. Do you happen to recall why exactly you did this?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4453
16242	ACCUMULO-4450	Did you want to fix this one for 1.7.3 and 1.8.1 also?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4450
16243	ACCUMULO-4446	[~lstav] how close is this? I'll leave it in 1.8.1 for now	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4446
16244	ACCUMULO-4446	[~lstav] yeah I saw it in there. Looked like it was close, do you think it is ready? Should it be pushed to 1.8.2?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4446
16245	ACCUMULO-4446	[~mjwall] as far as this issue is concerned, I think it is ready. After talking with [~elserj], he suggested creating an abstract class (which is in ACCUMULO-4552). One thing though, is that I branched the work from master, not from the 1.8 branch. Should I make the changes to the 1.8 branch too? Not familiar enough with changes for different versions.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4446
16246	ACCUMULO-4446	[~lstav] ah, ok. Typically, I think you should work on a ticket on the oldest branch it is assigned to. For this ticket that would be 1.7.3. When complete against, the 1.7 branch, we can merge it up into 1.8 then master. The alternative would be to merge it into master and then backport into 1.8 and 1.7, but I think starting at 1.7 is cleaner. This particular change would not be too back to backport, but can you create a new PR against 1.7 and reference https://github.com/apache/accumulo/pull/195. I'll get it merged up. Thanks man	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4446

#	Requirement	Questions	Answered	Successfully Answered	URL
16247	ACCUMULO-4443	[~ctubbsii], It appears to me that you changed the semantics of PerformanceTests with https://github.com/apache/accumulo/commit/be5c4334a7a6fda223c3213c66f4f9acda8e9f46 By having both categories, {{\@Category(\{MiniClusterOnlyTests.class, PerformanceTests.class\})}}, developers who don't want to run the PerformanceTests have to explicit specify them in the excludedGroups too. This is a change, no? I don't think the documentation reflects this change. If I'm not off my rocker, can you please fix the documentation?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4443
16248	ACCUMULO-4437	I agree. But, that leaves open the question about what this category is *for*. Is it just "not-mini-only", or is it "cluster tests which are not-mini-only".	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4437
16249	ACCUMULO-4437	bq. I agree. But, that leaves open the question about what this category is for. Is it just "not-mini-only", or is it "cluster tests which are not-mini-only". Yeah, in Accumulo I make the lazy assertion that "ITs" involve interaction with a running Accumulo in some form (all ITs are cluster tests) because that is the 99% case. I know we have exceptions. Perhaps the distinction would be good future-proofing.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4437
16250	ACCUMULO-4432	Is there a way to specify uncategorized tests? If so, maybe we don't need this. If not, then we could also probably do this with a checkstyle rule or maven plugin, rather than write our own. If we go that route, and one doesn't already exist, I'd be willing to create a maven plugin to do the check, so it could be used by multiple projects.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4432
16251	ACCUMULO-4432	bq. Is there a way to specify uncategorized tests? If so, maybe we don't need this. I am not aware of such a way. bq. If not, then we could also probably do this with a checkstyle rule or maven plugin, rather than write our own. If we go that route, and one doesn't already exist, I'd be willing to create a maven plugin to do the check, so it could be used by multiple projects. I am not sure if checkstyle would be sufficient to be able to analyze the type hierarchy (given the inherited annotation). I would be happy to use anything that already exists or you would like to create.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4432
16252	ACCUMULO-4432	Uh, nevermind. I see what you are doing now [~ctubbsii]. Do you want this in 1.8.1?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4432
16253	ACCUMULO-4423	Hey Dima! No pitchforks at all! We're happy to have help where offered. Presently, Maven still drives everything (which, personally, I like). The downside is that it does require a little bit of configuration instead of just doing something like picking up an hbase-site.xml and auto-bootstrapping itself off of the classpath. https://github.com/apache/accumulo/blob/master/TESTING.md#standalone-cluster We also, somewhere, have some integration that can run all of the Integration Tests we have presently via MapReduce. I'm... not sure where the documentation on that is. I think your approach would be nice for that. [~ecn] or [~ctubbsii], do you have anything you could point us to on the mapreduce IT execution?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4423
16254	ACCUMULO-4423	:) /me removes chainmail. Alright, let me dig around some more. I've been spending a bit of time in recent days playing around with what I found in that {{TESTING.md}} and did run into some complications when trying to point to my standalone cluster (like, at least on 1.7.2, an undocumented need to include a {{accumulo.it.cluster.clientconf}} system property). Do you happen to have any other documentation on getting tests running in standalone mode? Once I have my mind around it sufficiently, I'd love to try contributing something to make life easier for lazy engineers like myself (maybe starting with clarifying some docs, but then hopefully extending options for how people can run tests).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4423
16255	ACCUMULO-4423	bq. I've been spending a bit of time in recent days playing around with what I found in that TESTING.md and did run into some complications when trying to point to my standalone cluster (like, at least on 1.7.2, an undocumented need to include a accumulo.it.cluster.clientconf system property). Do you happen to have any other documentation on getting tests running in standalone mode? Hrm, [~mdrob] and I had chatted in IRC a few times on the matter too. Sounds like there's some bit-rot happening? I think I have this automated at $dayjob, let me cross-ref what is done there with the docs. This would be good to make sure is documented. bq. Once I have my mind around it sufficiently, I'd love to try contributing something to make life easier for lazy engineers like myself (maybe starting with clarifying some docs, but then hopefully extending options for how people can run tests). That'd be awesome! I'm going to go ahead and add you as a contributor so you can be autonomous on JIRA :)	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4423
16256	ACCUMULO-4423	Are we interested in this for 1.7 and 1.8 branches too?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4423
16257	ACCUMULO-4419	bq. This ticket is to account for work done elsewhere in which I've made the compression pool configurable such that we either don't use the pool at all or use an adjustable pool based on commons-pool [~phrocker], can you give a quick overview as to why we want wouldn't want to use the pool or would want the adjustable pool as you described? Best as I can recall, the pooling limits the number of Compressors we have resident in memory to (de)compress data that we're reading/writing. Each of these compressors has some internal byte array which consumed a "large" amount of memory on heap, causing JVM issues. Is that appropriate background for this?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4419
16258	ACCUMULO-4419	Thanks, Marc! This is exactly what I was looking for. Some further thoughts: bq. Internally we've used the non pooled method since CodecPool did not trim the compressors when they weren't being used. In some cases a large number of sources will increase the memory foot print, so this was for memory usage; however, the ability to choose a factory was something I added to accommodate those who wanted to make their own choice. So, avoid the pool entirely to make sure when a "scan storm" happens, you don't hold on to compressors for any longer than absolutely necessary? bq. In testing I found significant performance increases by changing the 1K buffer higher. Neat, is this reproducible at all? Seems like some sort of harness would be useful in ever revisiting this kind of testing. bq. I didn't want to confuse the focus of the PR, but I did want to allow the CompressorFactory implementation and its configuration the ability to be updated. Understood and appreciated. Dynamic configuration is super helpful and (IMO) the norm now.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4419
16259	ACCUMULO-4407	I'm not clear. Are you suggesting just changing our code to chroot to the instance ID, or are you suggesting changing the layout of the ZK /accumulo area, or both? It sounds like just the former, but driven by the fact that the layout is confusing. FWIW, I opened ACCUMULO-1719 awhile back because I found the layout unnecessarily confusing. That issue is a bit old now, but simplification of the layout could compliment the use of chroot (it'd certainly be easier to change the layout, without risking breakage, if we were using chroot).	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4407
16260	ACCUMULO-4383	My jenkins won't catch Java 6 problems, because I can't really get Java 6 to work with my version of Jenkins and Maven. (dependency jars have newer class files in them... polluting the classpath... hard to resolve). That's probably less of an issue with 1.7 branch and Java 7. Sooner we close out the 1.6 branch, the better for issues like this.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4383

#	Requirement	Questions	Answered	Successfully Answered	URL
16261	ACCUMULO-4376	bq. I like this idea, and it was something I was thinking about doing for the 2.0.0 API changes. It might be best if we coordinate this a bit, and decide what the next version of Accumulo will be, with these changes. I'd hate to add them in the old API, only to provide replacements in 2.0. It sounds like you haven't actually done anything yet for the 2.0 API re-write you've been working on. Why would we have to have replacements for it in 2.0? How would we future proof something that doesn't exist yet? :) I just don't want this to get bogged down in 2.0 hypotheticals. If there are concrete things we can do to make sure this will fit well into your redesign, please do share that info.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4376
16262	ACCUMULO-4376	Is the API design for 2.0 documented somewhere?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4376
16263	ACCUMULO-4376	There are a lot of important things in ACCUMULO-2589 but nothing related to how Keys and other structures are created. Are you talking about some specific task/comment of that JIRA?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4376
16264	ACCUMULO-4375	What version are you using? I see some Key constructors in the 1.7 branch that take byte[].	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4375
16265	ACCUMULO-4375	I would also like to add {{Range}} methods working on bytes, do you want me to do it in this JIRA or should I open another one?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4375
16266	ACCUMULO-4360	In 1.5.0 API calls and a shell command were added to cancel compactions, are you aware of these?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4360
16267	ACCUMULO-4358	[~ctubbsii] [~elserj] - can one of you two take a look? I feel like I did everything right, but rendering locally doesn't work so I have zero confidence in pushing this.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4358
16268	ACCUMULO-4357	For posterity, how did you identify the list of fixes? Do we have automated tooling for it? (Is it part of findbugs? checkstyle? coverity?)	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4357
16269	ACCUMULO-4356	Would this mechanism also give the downstream user an easy way to see what license those dependencies are under?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4356
16270	ACCUMULO-4356	actually, could we have a [DISCUSS] on dev@ about this? it's a pretty big change to how we package the project.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4356
16271	ACCUMULO-4353	bq. If multiple tablet servers die in quick succession, such as from a rolling restart of the Accumulo cluster or a network partition, this behavior can cause a storm of reassignment and rebalancing, placing significant load on the master. In the case of a rolling-restart, isn't that more of an operational issue to solve (give Accumulo time to process the reassignments before restarting more nodes)? Can you expand a bit more on the specifics behind a network partition that you're trying to solve with this? Say, you lose a node? A rack? Half of your racks? Are we talking about a 5second interruption/delay? 30s? Minutes? bq. To avert such load, Accumulo should be capable of maintaining a steady tablet assignment state in the face of transient tablet server loss. Instead of reassigning tablets as quickly as possible, Accumulo should be await the return of a temporarily downed tablet server (for some configurable duration) before assigning its tablets to other tablet servers. I'm a little worried about this as a configuration knob -- I feel like it kind of goes against the highly-available distributed database which we expect Accumulo to be. When we don't reassign tablets fast, that is a direct lack of availability for clients to read data. bq. placing significant load on the master Can you expand on this some more? Given that assignment is arguably the most important thing for the Master to do, why are we concerned about letting the master do that as fast as it can (for the aforementioned reason)? Do we need to come up with a more efficient way for the master to handle the reassignment of many tablets? For example, I know that HBase has special logic to batch assignments together in one RPC call to regionservers in order to bring things online more quickly (I'm not sure if we have logic like that -- instead we just spam requests to a tabletserver to load a tablet until it does so). While seeing a pull request accompanying the issue reported, It seems a bit premature to me to see code without some discussion on what the problems are and how best to solve them.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4353
16272	ACCUMULO-4353	Are you attempting to design a mechanism that could be used to avoid re-balancing and have the master keep assignments where they were previously, knowing that servers will come back into operation? I only ask because I question why the load on the master is a problem. You will cause load since clients will persist for that length of time. Wont' you increase the number of thrift connections waiting since you may not re-balance for some time?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4353
16273	ACCUMULO-4353	bq. Can you expand on this some more? Given that assignment is arguably the most important thing for the Master to do, why are we concerned about letting the master do that as fast as it can (for the aforementioned reason)? Do we need to come up with a more efficient way for the master to handle the reassignment of many tablets? Reading through this, and bringing some first-hand experience, I don't think the issue is the the Master assigning tablets. It's the issue of tablet servers that are down for a short period of time. When a tserver goes down, the Master re-assigns the tablets. When the tserver comes back up, it goes through several rounds of balancing which could take a long time and cause a lot of churn. bq. I'm a little worried about this as a configuration knob – I feel like it kind of goes against the highly-available distributed database which we expect Accumulo to be. When we don't reassign tablets fast, that is a direct lack of availability for clients to read data. I don't see any harm done here as long as the default behavior is what happens today. Allowing an administrator to choose to delay tablet reassignment may not fit most use cases, but it could fit some. My 2 cents.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4353

#	Requirement	Questions	Answered	Successfully Answered	URL
16274	ACCUMULO-4353	bq. Are you attempting to design a mechanism that could be used to avoid re-balancing and have the master keep assignments where they were previously, knowing that servers will come back into operation? That is the idea, yes. There is definitely a tradeoff here. bq. If this is really about trying to make rolling-restarts better, I'd encourage a look at ACCUMULO-1454. As I mentioned before, I hadn't seen ACCUMULO-1454 before starting this. I've now looked at the discussion of that ticket. What I implemented was approximately what Christopher Tubbs and David Medinets were suggesting. I also read through Keith Turner's design proposal summary. I have some reservations with it: * It requires that each planned restart involves tablet servers changing ports. While the recent changes to Accumulo to support a narrow port range during port search would make this more plausible, it might still prove difficult to establish firewall rules for Accumulo. (Sean Busby raises this issue in the discussion). * What happens if a tablet is split after migration starts? It seems to me there might be a race condition here which would lead to incomplete migration between sibling tablet servers. Do we block assignment during the rolling restart, too? That seems seems like a cure worse than the problem. * Even barring those two concerns, I again raise the spectre of ops complexity. To transition a single server, I need to know (a) which port the "old" tserver was running on, and (b) which port the "new" tserver is running on. If I'm using some sort of dynamic port assignment (which I would need to unless I pointed the "new" tserver at an entirely different configuration), it could be non-trivial to gather these pieces of information. While the burden on the operator of a cluster of 5 tservers might not be significant, the burden on the operator of a cluster of 200 tservers might make this approach infeasible. And the non-triviality of determining the correct port migration mapping would also make the process difficult to robustly automate. bq. While seeing a pull request accompanying the issue reported, It seems a bit premature to me to see code without some discussion on what the problems are and how best to solve them. Ahh, my mistake then. As a new contributor to Accumulo, I still don't have a full grasp of the rules, either written or unwritten. My feeling from watching the list was that primary modus operandi was to present a (fully implemented) solution along with a proposed problem, and then to discuss the merits of the solution.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4353
16275	ACCUMULO-4345	bq. May want to bump Accumulo's gson version to 2.2.4. Any idea on how Gson uses their version strings (do they actually follow something like semver)?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4345
16276	ACCUMULO-4345	I've been using Gson 2.3.1 in Fedora for some time now with Accumulo's packaging there. I don't know what they guarantee with regard to their versioning, but newer versions don't seem to cause any issues.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4345
16277	ACCUMULO-4328	(about to be anti-social...) Looking at the pull request, you're targeting this for 1.6, [~dlmarion]? I'd have (at least one) reservation in pulling this into 1.6: This really goes against the spirit of our release guidelines. This looks like it would have a huge impact on users. It's hard to quantify this because we have no good guarantees defined on the shell scripts/configuration. However, given that 1.6 is close to EOL, this change doesn't make sense to me for 1.6 or 1.7. For a 1.8 or 2.0, I think this would be a nice feature. It would be nice to get some high-level documentation on how it's expected to work before looking at the changes though: * How do we track multiple processes in the shell scripts? * How do we differentiate multiple tservers on a host internally (inside the master)? * What configuration do users need to make to take advantage of this? Since you already have a patch put together for this, I'm guessing I'm mostly looking for user manual updates (instead of a design doc).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4328
16278	ACCUMULO-4328	bq. This looks like it would have a huge impact on users. By default, it does nothing different than what happens today in 1.6 except for the pid in the log (which could be undone in the logger properties) bq. How do we track multiple processes in the shell scripts? I backported the pid support, so each tserver instance is named 'tserver-N' and it has an associated pid file. bq. How do we differentiate multiple tservers on a host internally (inside the master)? By hostname and port, just like today bq. What configuration do users need to make to take advantage of this? Take a look at the commented example in accumulo-env.sh, and they would need to set the tserver client port to zero.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4328
16279	ACCUMULO-4328	bq. By default, it does nothing different than what happens today in 1.6 except for the pid in the log (which could be undone in the logger properties) It still breaks usability between 1.6.5 and 1.6.6. Things that would work in 1.6.6 will not in 1.6.5 which is the entire spirit of our compatibility statement. bq. the pid in the log (which could be undone in the logger properties) They don't have separate log files? That sounds nightmareish to debug :) {quote} bq. What configuration do users need to make to take advantage of this? Take a look at the commented example in accumulo-env.sh, and they would need to set the tserver client port to zero. {quote} Lots of places like to have stable ports (for security or monitoring reasons). Maybe there's a better approach to be had than resorting to random ports?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4328
16280	ACCUMULO-4328	bq. It still breaks usability between 1.6.5 and 1.6.6. Things that would work in 1.6.6 will not in 1.6.5 which is the entire spirit of our compatibility statement. I don't understand how it breaks usability. Can you provide an example? bq. They don't have separate log files? Correct - not sure how you would do this with Log4J bq. Lots of places like to have stable ports (for security or monitoring reasons). Maybe there's a better approach to be had than resorting to random ports? Agreed, currently the tserver.client.ports property does not take a list or a range. I think that would be the solution here.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4328
16281	ACCUMULO-4328	{quote} bq. It still breaks usability between 1.6.5 and 1.6.6. Things that would work in 1.6.6 will not in 1.6.5 which is the entire spirit of our compatibility statement. I don't understand how it breaks usability. Can you provide an example? {quote} This is a _feature_ which will magically appear in a 6th release of the 1.6 line. All five previous releases in the 1.6 do not have this feature. This is against what we try to do. Users who see this feature in 1.6.6 might think that they can also do it in 1.6.3. This is extremely confusion and against what the versions are supposed to represent. Think about your experiences with configuration properties suddenly appearing in a .Z (of an x.y.z version string) in Hadoop. How jarring would that be to you if 2.6.4 had something that 2.6.1 didn't? {quote} bq. They don't have separate log files? Correct - not sure how you would do this with Log4J {quote} I think this would be pretty important to figure out. Not having separate log files per daemon would be very strange to try to explain.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4328
16282	ACCUMULO-4328	bq. How jarring would that be to you if 2.6.4 had something that 2.6.1 didn't? You mean like https://issues.apache.org/jira/browse/HDFS-7694? Yes, I went and looked for one :-)	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4328

#	Requirement	Questions	Answered	Successfully Answered	URL
16283	ACCUMULO-4328	Upfront, I'm neutral on this and could go either way - with the caveat that going from 1.6.x to 1.6.6 with this capability does not change any behavior if the feature is not enabled. And that would include needing to modify a current user script in any way. If I can use a 1.6.x config and run it with 1.6.6 without needing to change anything, well, maybe. I'm less worried about going backward, but we would want it documented clearly so that people know what to expect if the needed to roll back and were counting on this. Random ports bother me. If there is an option to assign a port, or default to a random one if you don't care, okay - if I can only use a random port, that seems to be a problem if we try to be more container friendly as well as port blocking considerations. The big question that I have is, even if you could do this, would you want to? Are there any performance improvements running multiple tservers vs increasing thread counts and memory on a single tserver? I don't think we are normally CPU bound, and multiple tservers are going to be contending for the same IO bandwidth. If we had a benchmark where this did show substantial improvement, then maybe its okay for the 1.6 line. If we don't have that or the time to evaluate it, then 1.7+ may be a better option so that we don't get into a case where - sure its possible - but don't ever do that because A, B ... Z in 1.6.6, use 1.7.x where we fixed that... .	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4328
16284	ACCUMULO-4328	bq. ...with the caveat that going from 1.6.x to 1.6.6 with this capability does not change any behavior if the feature is not enabled. And that would include needing to modify a current user script in any way. I believe this to be the case, that you should not have to change anything. bq. Random ports bother me. If there is an option to assign a port, or default to a random one if you don't care, okay - if I can only use a random port, that seems to be a problem if we try to be more container friendly as well as port blocking considerations. I agree that random ports may be an issue, but its an issue that predates this JIRA. I feel that if we are going to modify tserver.port.client to take a list or range of values instead of 1 value for the purposes that have been stated, then that should be a separate JIRA. However, for the purposes of this issue, if someone wants to use this feature, then they are also choosing to deal with random ports. bq. The big question that I have is, even if you could do this, would you want to? I don't have any specific evidence to share, but in talking with [~kturner] he expressed an interest in this feature. Maybe he can give more specifics. I will say that one way to scale Accumulo is to add more tablet servers, and just because you have saturated one tablet server does not mean that you have saturated the disk or network bandwidth of the host on which it's running.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4328
16285	ACCUMULO-4328	{quote} The big question that I have is, even if you could do this, would you want to? Are there any performance improvements running multiple tservers vs increasing thread counts and memory on a single tserver? I don't think we are normally CPU bound, and multiple tservers are going to be contending for the same IO bandwidth. If we had a benchmark where this did show substantial improvement, then maybe its okay for the 1.6 line. If we don't have that or the time to evaluate it, then 1.7+ may be a better option so that we don't get into a case where - sure its possible - but don't ever do that because A, B ... Z in 1.6.6, use 1.7.x where we fixed that... {quote} I think [~afuchs] did some sort of benchmark a while back which showed some promise, but that was, IIRC, related to contention in rolling WALs -- something that [~ecn] made better with ACCUMULO-3423 in 1.8. Good benchmarks to understand the cases when this would have performance benefits would be great documentation to include. bq. I agree that random ports may be an issue, but its an issue that predates this JIRA. Yes and no, IMO. This is formalizing the ability to run multiple TServers as a "feature" which means it needs to be figured out. bq. Would re-basing this PR against 1.7 be a sufficient compromise? I'm a little less worried against 1.7, but am still not be in favor of it. I'd like to hear what others have to say before I blindly -1 it. The only difference with my complaints with it landing in 1.7 instead of 1.6 is that we have 4 fewer point-releases on 1.7 than 1.6, but that's still two releases which would have different semantics. [~kturner], [~busbey], you both often have good strong opinions on compatibility -- a bit of your time to provide some opinions would be appreciated.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4328
16286	ACCUMULO-4328	Hadoop is a terrible example to look at, because our versioning there is a mess. Surprising changes regularly show up in double-dot releases and changes that can only be undone with a system rollback happen on single-dot releases. For example I had to argue against changes to the datanode's underlying filesystem layout on a double-dot release recently. I personally wouldn't want to see this in a 1.6 or 1.7 release for largely the same reasons Josh states. Changing basics around how we do process management on a double-dot release is tempting trouble. It's not this particular PR's problem, but we have essentially no testing around our scripts so any verification of how 'safe' changes like this are essentially come down to some subset of us working through them manually with ill-defined criteria. But I agree with Dave that this kind of change would not violate the letter of our versioning policy, so I wouldn't -1 on principle. If problems showed up after we had a 1.6.z release that contained it I would, however, then strongly advocate for reverting it in later 1.6 releases using the same 'not the public API' argument. Aren't we getting ready to have a 1.8 release soon? What's so pressing about this particular new feature that means we should introduce risk in our established lines rather than roll forward with more minor releases? The lack of user-facing docs on what can be expected from this feature, when folks should use it, how folks should use it, etc cause me concern. I get that we pretty regularly have an issue with these kind of "finishing touches" on feature in Accumulo, but it's particularly troublesome to me when these kinds of 'in-the-know' things show up in maintenance releases. I'd also strongly prefer having the different tserver instances log to distinct files, regardless of what version this lands in. I get that I can use post-processing to figure out which lines correspond to a given process, but I'm skeptical of log4j's ability to efficiently and safely have multiple processes share a log file. This should be doable with a log4j configs since we control the filename via a classpath config file. I don't have strong feelings on how we go about doing that, wether it's example config files that show making a config-per-expected-process (preferably referenced/explained in the user manual) or a parameter in a single log4j config that the launching script sets via a system property.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4328
16287	ACCUMULO-4325	What does this configuration look like? Where would it live?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4325
16288	ACCUMULO-4325	bq. Since it's not actually part of our project, which we intend to "release" to users, I'd prefer we keep it out of our development branches, if possible (not sure if it's possible or not... it's just my preference). How do you propose we configure how each branch gets tested then? Is that not a part of the codebase? It seems extremely silly to have a completely separate repository solely for a single shell script per branch.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4325
16289	ACCUMULO-4325	Do we actually need a personality per branch? I've been updating the HBase personality with the assumption that we wouldn't over there, and I think [~aw] has been doing the same for Hadoop. On the matter of jdk versions changing per branch, there's YETUS-369. HBase is waiting for that change, but Allen has a workaround documented there now that Hadoop uses.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4325

#	Requirement	Questions	Answered	Successfully Answered	URL
16290	ACCUMULO-4324	[~kturner] mentioned we needed to add a new DATA_VERSION to prevent things like 1.7 successfully coming up on a 1.8 instance. One ticket that I know requires this change is ACCUMULO-1124, which changed the RFile index. Anyone know of other tickets that should be listed as part of this? I am about to put a PR for this. Then I want to test an upgrade locally. Here is my plan. 1 - startup 1.7 2 - write some data, scan it 3 - stop Accumulo 4 - startup 1.8 on top of that hdfs/zk 5 - assure can read data, write some more data and scan it 6 - stop Accumulo 7 - try to restart 1.7 and verify it fails Are there any other things that should be done in testing an upgrade?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4324
16291	ACCUMULO-4314	[~kturner] - are you still on track to get this done soon? I see that ACCUMULO-1124 has been completed.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4314
16292	ACCUMULO-4314	I ran test with the changes in 1.7 for this issue using the same file I was testing the changes for ACCUMULO-1124 with. The total index size went from 6.9M to 3.6M. {noformat} $ accumulo rfile-info /accumulo/tables/2/default_tablet/A0000005.rf Reading file: hdfs://localhost:10000/accumulo/tables/2/default_tablet/A0000005.rf Locality group : <DEFAULT> Start block : 0 Num blocks : 20,041 Index level 1 : 4,140 bytes 1 blocks Index level 0 : 3,620,079 bytes 14 blocks First key : um:d:385:%03;%01;10.30.170.244>>o>/2954%af; data:current [] 4611686019157309597 false Last key : um:d:395:%03;%01;%ff; com.facebook>.www>s>/dialog/feed?app_id=90376669494... 16293	ACCUMULO-4308	I just visually examined all the jars and they all appear to have a {{*.java}} file for every {{*.class}} file, so at least their source is currently available.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4308
16294	ACCUMULO-4306	Could you expand a little more on the likely usecases for this? I'm having trouble following and this seems like a pathway to easy security compromises. 1) In the case of HDFS not being exposed to an external network, wouldn't this change allow a user-submitted coprocessor executing server side to read arbitrary backing files? 2) In the case of a multi-tenant deploy of HDFS where Accumulo requires kerberos but other tenants don't, wouldn't lacking kerberos on HDFS mean that other tenants could read backing files? Why would Accumulo then have a requirement for kerberos for just its tenants? Wouldn't it also have the same problem as in #1? Perhaps a better reason for the same changes needed here: how do we handle authenticating the TServers to multiple HDFS instances in a multi-volume deployment? Right now, I suspect they'd have to all use the same keytab/principal?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4306
16295	ACCUMULO-4306	I think both of those points are really the same thing, which is "Can't a process running on the cluster that isn't Accumulo read backing files?" The answer is most likely yes, given a couple of circumstances: 1) Any user in the accumulo group will be able to read backing files. Authentication is a non-factor for any such process. Potentially using something like Ranger would allow stricter authorization policies to mitigate this. 2) Without HDFS authentication enabled, a user could masquerade as another user via webhdfs and that allows them to get around the authorization restriction mentioned above. In my use case, we have some other safeguards in place to mitigate this, such as cell level encryption that would require credentials external to both HDFS & Accumulo. For clarity's sake, when I say "user" I mean a user as HDFS would see it. I was not referring an Accumulo user, which is, by default, a synthetic account in ZooKeeper. As the architecture currently sits, only a subset of users (the Accumulo service principals, {{accumulo/HOST@REALM}}) interact with HDFS. Mostly I'm trying to get around the fact that "security" is either "on" or "off" for all of HDFS, and I have specific read paths through Accumulo for external clients that I'd prefer be strongly authenticated so they can get their proper authorizations. I was thinking about whether or not an encryption zone over Accumulo's data directory would help as well, but so long as a user can pretend to be another user, they'd be able to do #2 to decrypt the directory's contents. I believe that the multi-volume case *should* work correctly right now. So long as each NN process is running as its own service principal, SASL+GSSAPI should be able to handle negotiation tickets between a given TServer (as {{accumulo/$HOST@REALM}}) and the NN as if it were any other service. Would an update to our documentation/user manual that outlines the consequences of security configurations (both current and those as a result of this ticket) help sway you one way or the other? I think there's already gaps in our current capabilities now that are undocumented, and this would just add more unknown variables. Specifically you've mentioned reading backing files, but there are other concerns from Accumulo's perspective (such as user authorizations) that are a separate class of protection mechanisms which I'm also trying to consider. As as always, I appreciate the comments Sean :)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4306
16296	ACCUMULO-4306	Well, point one is no different than "out of the box" right now anyways. If you are allowed to deploy any code into Accumulo, it must be trusted code. Am I missing something in your example?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4306
16297	ACCUMULO-4306	{quote} Would an update to our documentation/user manual that outlines the consequences of security configurations (both current and those as a result of this ticket) help sway you one way or the other? I think there's already gaps in our current capabilities now that are undocumented, and this would just add more unknown variables. Specifically you've mentioned reading backing files, but there are other concerns from Accumulo's perspective (such as user authorizations) that are a separate class of protection mechanisms which I'm also trying to consider. {quote} Yes, this would help. HDFS without kerberos enabled is a pretty big red flashing light in my experience, so it would especially help me evaluate the delta we're talking about for likely my-first-cluster misconfigurations.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4306
16298	ACCUMULO-4195	While it seems trivial, designing this going particularly well for me. A naive solution just ends up with some {{FileOperationsOptions}} object which holds all possible parameters for all {{FileOperations}} methods. While this solves one problem (changes to {{FileOperations}} inputs no longer require global code changes), it introduces another: it's no longer obvious which methods support which parameter groups. e.g. "Why can't I specify a range when opening a reader for seeking?" "What does the set of column families mean when I'm opening a writer?" "How do I rate limit a {{getFileSize()}}?" A separate {{...Options}} object for each of the 5 primary method types would be possible, but would be a lot of boilerplate, and might prove difficult to maintain. My first attempt in code attempted to meet in the middle, and ended up enjoying the worst of both designs.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4195

#	Requirement	Questions	Answered	Successfully Answered	URL
16299	ACCUMULO-4195	GitHub user ShawnWalker opened a pull request: https://github.com/apache/accumulo/pull/95 ACCUMULO-4195 Added generalized configuration objects for RFile interaction Implemented a builder/fluent style of syntax, where each operation creates an operation object with both some methods for setting parameters and an execute() method to actually invoke the operation. I'm not really sure if this is in line with the improvement the reporter suggests. It does however address the only goal I can identify with that request: it should be possible to extend the interface `FileOperations` in a manner such as was done for ACCUMULO-4187 without requiring significant changes to unrelated code. Also, the automatic formatter hates me, and completely undid most of my eye-pleasing formatting. You can merge this pull request into a Git repository by running: $ git pull https://github.com/ShawnWalker/accumulo ACCUMULO-4195 Alternatively you can review and apply these changes as the patch at: https://github.com/apache/accumulo/pull/95.patch To close this pull request, make a commit to your master/trunk branch with (at least) the following in the commit message: This closes #95 ---- commit 8917a37a4134a04bb47fac8e14320ea6f1916ed4 Author: Shawn Walker <accumulo@shawn-walker.net> Date: 2016-04-19T19:54:31Z ACCUMULO-4195 Added generalized configuration objects for RFile interaction. Implemented a builder/fluent style of syntax, where each operation creates an operation object with both some methods for setting parameters and an execute() method to actually invoke the operation. ----	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4195

What do you think about something like: ``` FileOperations.getInstance().newWriterBuilder().ofFile(tempFile.toString(), fs, defaultConf) .withTableConfiguration(AccumuloConfiguration.getDefaultConfiguration()).build(); ``` Using the common "builder" and "build" terminology makes it a bit obvious how this works. "openWriter" would imply to me that something is being opened (that I would need to close) and I'm not sure what "execute" would be doing at all on some I/O handle. I know this is a little nit-picky, but if we're going to make the APIs better, I'd be in favor of making them as clear as possible to prevent ourselves from coming back here soon.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4195

A lot of our internal passing around of AccumuloConfiguration makes it easy to lose track of where the configuration object came from, making it harder to ensure we're not using it outside the intended scope (for example, if it represents a TableConfiguration). In many parts of our internal code, I would prefer we grab what we need from AccumuloConfiguration, combine it with any additional configuration appropriate for that specific context, and create a new context-specific configuration object to pass around within that context. If we were to do something like that, what would the context granularity be here? "file operations options", "file reading options", something else?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4187

16332	ACCUMULO-4171	Do we know how stable htrace's API is going to be as it moves forward from here on? Does htrace have an API statement, like semver? My concern is that now that Hadoop and Accumulo are both using HTrace, updating HTrace might further constrain the Hadoop versions we support (same with not updating it). If HTrace's API is not stable (or if Hadoop or ourselves use items which are not in HTrace's declared stable API), we may be limited to using only the exact version that Hadoop is using.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4171
16333	ACCUMULO-4171	Ah, that kind of makes sense. Do you recall why it seemed impossible to use? The only issue I encountered was that HDFS generates way too many spans, but we dealt with that in the Accumulo SpanReceiver by dropping the 0ms spans.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4171
16334	ACCUMULO-4171	Am I to read this that no Accumulo versions will work with Hadoop 2.6 and Hadoop 2.7?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4171

#	Requirement	Questions	Answered	Successfully Answered	URL
16335	ACCUMULO-4171	are we still interested in this for 1.9? (or some other version)	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4171
16336	ACCUMULO-4171	What would alleviate those concerns though? e.g. I haven't seen anything in the HTrace community to suggest the issue I mentioned around upgrades has changed. Hadoop has a stated policy of not promising to avoid changes in dependencies across minor versions (or really any versions: [ref hadoop compat policy|http://hadoop.apache.org/docs/r2.7.2/hadoop-project-dist/hadoop-common/Compatibility.html#Java_Classpath]). We're already out of sync for tracing through to Hadoop for anything other than Hadoop 2.7.z. Do we need to go the shim route to try to handle tracing through to multiple versions? Or do we just bump our version along with Hadoop updates?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4171
16337	ACCUMULO-4165	It looks that the API you're envisioning will require some understanding of how locality groups are stored in RFiles. Have you considered omitting locality group support entirely, or just using a single default locality group if none are started before the first key is appended? For the factories, I'd assume the minimum information to provide is the filename? If so, should it default to "file://" if it begins with a "/"? For the parameters which take sizes, it'd be useful to be able to specify a string format, like "20M" instead of 1024*1024*20 bytes. Will this API be something that could be used internally to clean up some of our code which uses RFiles? (I hope so.)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4165
16338	ACCUMULO-4165	bq. For the factories, I'd assume the minimum information to provide is the filename? If so, should it default to "file://" if it begins with a "/"? If the default FileSystem is against the local filesystem, it seems reasonable to just always create a Path using that FileSystem (deferring to FileSystem to "localize" it, or tell us if it already has the wrong scheme?). bq. For the parameters which take sizes, it'd be useful to be able to specify a string format, like "20M" instead of 1024*1024*20 bytes. IMO, I think accepting a long representing bytes is fine, but :shrug:. I just think it's pretty easy for someone to make a constant in their code for certain numbers.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4165
16339	ACCUMULO-4165	bq. Have you considered omitting locality group support entirely, or just using a single default locality group if none are started before the first key is appended? Sorry I did not see these comments until now. Not going to drop support for locality groups. I think I will make it automatically start the default locality group. That should be a quick change.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4165

16342	ACCUMULO-4164	I would love to see the perf test results for this change. Can you post them, [~kturner]?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4164
16343	ACCUMULO-4156	bq. I didn't see any special offsets for WAL files Sorry, I meant to say, definitively, that this doesn't exist. I think this was something I considered as a future improvement which would enable more responsive replication. bq. I think you'd need some marker for a WAL that lives through a flush so you don't do a double-insert incase of a failure after a flush. But a flush is just pushing the IMM to disk -- the records should already be recorded in the WAL by the time they make it into the IMM. Am I misunderstanding?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4156
16344	ACCUMULO-4147	Github user keith-turner commented on the pull request: https://github.com/apache/accumulo/pull/74#issuecomment-188983450 @tristeng the proxy has fairly comprehensive ITs that excercise most of its API. There are located in `accumulo-test/src/main/java/org/apache/accumulo/test/proxy`. Would you be able to add test for these new namespace operations?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4147
16345	ACCUMULO-4147	Github user keith-turner commented on the pull request: https://github.com/apache/accumulo/pull/74#issuecomment-189345114 > Any thoughts on where I should look? Looking at the test I have a strong suspicion that the reason the test is failing is because its using MockAccumulo. When things worked w/ your Python test client, was that proxy back a mini or real accumulo instance? I would discourage using Mock. Its been deperecated because it was not being well maintained as features (like namspaces) were added to Accumulo. I would also encourage you to add your namespace test to SimpleProxyBase. TBinaryProxyIT, TJsonProtocolProxyIT, etc all extend SimpleProxyBase but run configure a different protocol. All of the test in SimpleProxyBase are run using multiple thrift protocols. Also, the test in SimpleProxyBase use MiniAccumulo instead of MockAccumulo.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4147
16346	ACCUMULO-4147	Github user keith-turner commented on a diff in the pull request: https://github.com/apache/accumulo/pull/74#discussion_r57719585 --- Diff: test/src/main/java/org/apache/accumulo/test/proxy/SimpleProxyBase.java --- @@ -836,6 +1020,22 @@ public void testExists() throws Exception { } @Test + public void testNamespaceExists() throws Exception { + try { + client.createNamespace(creds, namespaceName); --- End diff -- Also, will this test pass if not exception is thrown?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4147
16347	ACCUMULO-4147	Github user keith-turner commented on the pull request: https://github.com/apache/accumulo/pull/74#issuecomment-205440868 Thanks @tristeng. I squashed and merge this, can you close this PR? I ran the following test w/ no problem before pushing. That caused some reformatting which was included in the commit I pushed. I also added `since 1.8.0` to the comment in the proxy.thrift file. ``` mvn clean verify -DskipITs mvn -Dit.test=".*proxy.*" -Dtest=foo -Dfindbugs.skip -Dcheckstyle.skip -DfailIfNoTests=false verify ```	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4147
16348	ACCUMULO-4132	It seems like your proposed change would be source compatible. However I am uncertain if its binary compatible. Will code compiled against {{TableOperations::addSplits(SortedSet<Text>)}} work with {{TableOperations::addSplits(Collection<Text>)}}? I suspect its not binary compat, but not positive. We can only make the changes if its binary compat. If not binary compat, another possible option is to add a method {{TableOperations::addSplits(Collection<Text>)}} and not remove {{TableOperations::addSplits(SortedSet<Text>)}}. Should be able to have both.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4132
16349	ACCUMULO-4111	Thanks for the patch. I will add you as a contributor in Jira and assign this issue to you. Two comment regarding the patch : * The class needs a {{@since 1.8.0}} javadoc tag * Would you be able to modify the patch to extend {{AbstractLexicoder}} and have a {{ protected Float decodeUnchecked(byte[] data, int offset, int len)}}} method? This is to follow the precedent set in ACCUMULO-3789.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4111
16350	ACCUMULO-4111	Thanks [~kturner] Was this the best way to deal with this process? If there is another way that is easier for you guys I'm happy to follow it next time. Could you put me down with the Satellite Applications Catapult (https://sa.catapult.org.uk/) and Europe/London or 0/+1 for the time zone.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4111

#	Requirement	Questions	Answered	Successfully Answered	URL
16351	ACCUMULO-4111	bq. Was this the best way to deal with this process? If there is another way that is easier for you guys I'm happy to follow it next time. Only thing I noticed was that you should feel free to leave "old" patches attached to the JIRA issue. The numbering scheme you were doing is recommended and can be helpful to go back and review old changes (in the face of heated discussion). You're also welcome to use pull requests on Github. We don't care too much either way. Thanks, again, for your contribution :)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4111
16352	ACCUMULO-4109	Is this something you'd like to do for 1.7.1, [~ctubbsii]? If so, any cycles to do it this week?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4109
16353	ACCUMULO-4109	Github user joshelser commented on the pull request: https://github.com/apache/accumulo/pull/64#issuecomment-173720610 Very nice stuff!! Left two comments that I thought of looking at the code. Have you run this through shellcheck? That would be a nice bar to set for ourselves.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4109
16354	ACCUMULO-4107	Are you thinking Hadoop metrics2-level reporting or something in the monitor (akin to the normal ingest rate graph)?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4107
16355	ACCUMULO-4104	What are you doing to colorize? I use a bash function in {{~/.bashrc}}: {code} function mvn() { trap 'echo -en "\e[m"' SIGHUP SIGINT SIGTERM command mvn "$@" 2>&1 | awk ' BEGIN { IGNORECASE=1 } /BUILD SUCCESS/ { print "\033[1;36m" $0 "\033[m" ; next } /^\[FATAL\]/ { print "\033[1;31m" $0 "\033[m" ; next } /^\[ERROR\]/ { print "\033[1;31m" $0 "\033[m" ; next } /^\[TRACE\]/ { print "\033[2;33m" $0 "\033[m" ; next } /^\[WARNING\]/ { print "\033[1;33m" $0 "\033[m" ; next } /^\[DEBUG\]/ { print "\033[2;34m" $0 "\033[m" ; next } /^\[INFO\]/ { print "\033[0;37m" $0 "\033[m" ; next } /^\[ALL\]/ { print "\033[1;37m" $0 "\033[m" ; next } { print } ' return ${PIPESTATUS[0]} ${pipestatus[1]} } {code}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4104
16356	ACCUMULO-4087	Using the "sticky" (previously chosen volume for that tablet) could work. I'm not a big fan of the sticky volume behavior. Another option, instead of using the previously chosen one, is to pull the table id from the {{KeyExtent}}, and re-choose with the appropriate chooser for that table (assuming the per-table chooser is configured as the general chooser). That might save some work examining the tablet's metadata, but at the risk of choosing another location (which is probably fine anyway). Of course, that only works if the {{FileUtils}} code is only being used for tablet- or table-scoped temp files, and not also used for general-purpose temp files (do we even have any such files? intermediate write-ahead logs? if we do, do they use this code?).	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4087
16357	ACCUMULO-4086	Are we ready to merge this one in?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4086
16358	ACCUMULO-4086	I am needing this change for deployment onto our test system. Can we attempt to get this one wrapped up? I see there are now conflicts that have crept in. I will attempt to resolve those with another pull request into your branch.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4086
16359	ACCUMULO-4079	See ACCUMULO-2069. Almost two years to the day :-). I don't think we did anything, but I will double check when I get back in to the office to see if we changed something internally.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4079
16360	ACCUMULO-4078	Hi [~Matt Peterson]. Thanks for the feedback. I have some thoughts/remarks. bq. A new volume is added, with limited capacity, to be dedicated for a specific table. All other tables or files should be excluded from this new volume. How does the [PerTableVolumeChooser|https://github.com/apache/accumulo/blob/master/server/base/src/main/java/org/apache/accumulo/server/fs/PerTableVolumeChooser.java] fall short for what you'd like to do? I could see a static VolumeChooser implementation configured for the table in question that always chooses a specific volume. Every other table would use the default VolumeChooser (an implementation which ignores that special volume?). Maybe PreferredVolumeChooser already gives you the ability to limit the volumes you want to use (in a inclusive way, instead of exclusive). bq. It's not currently possible to specify preferred volumes for the write-ahead logs What's your intended effect from such a change? Remember that WALs are per-server, not per-table. bq. the failsafe chooser is the RandomVolumeChooser which will include the instance volume that needs to be excluded. It would be useful to have a configurable failsafe in this situation. By "failsafe" you mean a default chooser? I can see the value in mimicking how we do site-wide and per-table configuration values. When a per-table implementation doesn't exist (or is not relevant), it defers to the site-wide chooser. The approach we have now makes the provided implementations a bit more brittle since you inherit some default functionality (which I think is what you meant). bq. The volume chooser is called in FileUtils for temp directory creation but it could instead use the sticky dir to create the temp directory, not needing the volume chooser at all. I don't understand what you mean by "use the sticky dir". Why would we not want to use the volume chooser implementation when choosing a temp directory? This seems like an inconsistency since we do this for all other file-based operations. Also, are you planning to work on these changes? If so, let's get this ticket assigned to you :)	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4078

#	Requirement	Questions	Answered	Successfully Answered	URL
16361	ACCUMULO-4078	Josh, Thanks for reviewing this ticket. {quote} What's your intended effect from such a change? Remember that WALs are per-server, not per-table. {quote} I'd like to exclude the WAL from the special volume for all tables. Let's assume that the special instance is appropriately sized for only that one table. The PerTableVolumeChooser will default to the random chooser for WAL files. The random chooser which will include all volumes, including the one that I want to exclude. {quote} I don't understand what you mean by "use the sticky dir". Why would we not want to use the volume chooser implementation when choosing a temp directory? This seems like an inconsistency since we do this for all other file-based operations. {quote} Sorry I realize now that the language was unclear. By "sticky dir" I was referring to the srv:dir entry for that tablet. The thought was that there is no need to choose a volume for the temp dir in the same way that Accumulo doesn't choose a volume each time it writes a new file for a tablet. It chooses a volume when first creating the volume and then continues to send its files there. {quote} How does the PerTableVolumeChooser fall short for what you'd like to do? I could see a static VolumeChooser implementation configured for the table in question that always chooses a specific volume. Every other table would use the default VolumeChooser (an implementation which ignores that special volume?). Maybe PreferredVolumeChooser already gives you the ability to limit the volumes you want to use (in a inclusive way, instead of exclusive). By "failsafe" you mean a default chooser? I can see the value in mimicking how we do site-wide and per-table configuration values. When a per-table implementation doesn't exist (or is not relevant), it defers to the site-wide chooser. The approach we have now makes the provided implementations a bit more brittle since you inherit some default functionality (which I think is what you meant). {quote} Yes, by "failsafe" I meant a default chooser, to be used when none is configured. Additionally, it would be used when a chooser is configured but cannot be used due to an error in its instantiation or configuration. There are cases with both the PreferredVolumeChooser and the PerTableVolumeChooser in which each will default to the RandomVolumeChooser, even if a site-wide default configuration is used. If the PerTableVolumeChooser is used as the general volume chooser and PreferredVolumeChooser is used as the site-wide table volume chooser, then this use case is nearly satisfied. The special table would be configured to include only the special volume. Most tables would inherit the site-wide configuration, which excludes the special volume. With this configuration, which I believe is the one you've suggested, there are a few cases when the special volume will be used: 1) .choose is called without a table id, resulting in files going to this special volume (e.g. WAL), (PreferredVolumeChooser and PerTableVolumeChooser behavior) 2) a table overrides the site-wide configuration but that override is misconfigured and fails, causing files to go to the RandomVolumeChooser (PerTableVolumeChooser behavior) PreferredVolumeChooser and PerTableVolumeChooser could use a configurable default, other than the RandomVolumeChooser. So there would be a general.volume.chooser and a general.volume.chooser.fallback.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4078
16362	ACCUMULO-4078	One last round of responses here on the parent :). Let's move discussion into the appropriate sub-tasks since Christopher took the time to make them {quote} bq. What's your intended effect from such a change? Remember that WALs are per-server, not per-table. I'd like to exclude the WAL from the special volume for all tables. Let's assume that the special instance is appropriately sized for only that one table. The PerTableVolumeChooser will default to the random chooser for WAL files. The random chooser which will include all volumes, including the one that I want to exclude. {quote} This would be an extreme overhaul of the WAL system. While it's easy to choose a different volume for a WAL, the point is that *all* tables hosted on a server share the same WAL file. There is no means to have a separate WAL for just one file. It's not impossible -- I just want to make sure you understand that this would be a serious undertaking. bq. Sorry I realize now that the language was unclear. By "sticky dir" I was referring to the srv:dir entry for that tablet. The thought was that there is no need to choose a volume for the temp dir in the same way that Accumulo doesn't choose a volume each time it writes a new file for a tablet. It chooses a volume when first creating the volume and then continues to send its files there. Gotcha, I understand where you were coming from now. Maybe it makes sense to have a srv:temp for a tablet? What's the net benefit of keeping a static temporary directory for a tablet? bq. If the PerTableVolumeChooser is used as the general volume chooser and PreferredVolumeChooser is used as the site-wide table volume chooser, then this use case is nearly satisfied. The special table would be configured to include only the special volume. Cool, I think this would be a nice addition. bq. PreferredVolumeChooser and PerTableVolumeChooser could use a configurable default, other than the RandomVolumeChooser. So there would be a general.volume.chooser and a general.volume.chooser.fallback. My first reaction is that it seems unnecessary to provide multiple "general*" volume chooser properties, but I need to read through your situations some more :). I think it would be best if we can continue to follow the global/site configuration and per-table/namespace overrides for VolumeChooser properties.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4078
16363	ACCUMULO-4078	bq. What's the net benefit of keeping a static temporary directory for a tablet? I'm not convinced there's even a benefit to having a static non-temporary directory for a tablet (srv:dir). Personally, I'd prefer choosing on every file creation (with as much information about the scope/environment as possible, so it can make a good decision based on current configuration vs. a past decision)... ACCUMULO-3090 bq. My first reaction is that it seems unnecessary to provide multiple "general*" volume chooser properties I agree. Some of the situations might be considered distinct "scopes" appropriate for a special config. However, many others might be behavior dependent on a particular configured global or per-table chooser, and it might be more appropriate to provide ACCUMULO-3384 to empower those various implementations.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4078
16364	ACCUMULO-4066	This one slipped in under my radar. Thought I'd give your changes a glance. 3x speed up is awesome! {code} - for (Condition cond : cm.getConditions()) { + // sort conditions inorder to get better lookup performance. Sort on client side so tserver does not have to do it. + Condition[] ca = cm.getConditions().toArray(new Condition[cm.getConditions().size()]); + Arrays.sort(ca, CONDITION_COMPARATOR); {code} To confirm, the server doesnt' rely on the sorted order, just hopes for it for performance reasons? I see a lot of changes in IteratorUtil (I assume to your point about loading iterators from the table config). How did this used to work? You had lots of new tests added for the other cases -- do we have good coverage for IteratorUtil already?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4066
16365	ACCUMULO-4066	bq. To confirm, the server doesnt' rely on the sorted order, just hopes for it for performance reasons? correct. bq. I see a lot of changes in IteratorUtil (I assume to your point about loading iterators from the table config). How did this used to work I needed parse table iter config once, cache that and then later merge condition iterators. I changed IteratorUtil to support this use case. Used to it would parse the table iterator config for each condition. I also modified the code to support caching class name to classes (Instead of going to the VFS classloader for each condition to load a class). Adding some test for IteratorUtil is a good idea.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4066
16366	ACCUMULO-4062	Is there a reason not to do this? What am I missing?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4062
16367	ACCUMULO-4062	{code}org.apache.accumulo.core.data.Mutation#hashCode{code} in master looks like this for me: {code} @Override public int hashCode() { return serializedSnapshot().hashCode(); } {code} what code are you looking at?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4062

#	Requirement	Questions	Answered	Successfully Answered	URL
16368	ACCUMULO-4062	Wouldn't this cause writes to arrive within a single tablet potentially in a different order then the user added them?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4062
16369	ACCUMULO-4062	Wouldn't computing the hash be kind of expensive (in comparison to List#add)? Couldn't the client just keep better track of the mutations they are generating?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4062
16370	ACCUMULO-4051	Is there a medium-term plan for syncing Accumulo and Thrift? The latter has gotten a lot of updates (security, compiler and library layers, etc) since 0.9.1, and needs a lot more, but it's hard to commit to making that happen on the Thrift end if we're pinned at an old version with no way forward.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4051
16371	ACCUMULO-4051	[~tlippy01], the problem for us is that it typically requires testing with a very close eye after upgrading Thrift. Historically, we've been bitten many, many times after upgrading the version of Thrift with performance regressions and more. As such, the worry from Accumulo's end is "will we have more issues?", but this isn't a blocker from doing it. We just need someone who can sit down, upgrade to 0.9.3, and run some of our tests over multiple nodes to check things out. In other words, I don't think we need multiple layers of planning yet; we just need someone to investigate.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4051
16372	ACCUMULO-4050	It's not clear to me what a "configuration container" means. Can one of you describe this in more detail, maybe include an example that would outline how the existing set of properties in ZK would appear with this suggested design? Similarly, what defines a snapshot WRT the data stored in ZK? Using ZK transaction id, maybe ZNode Version? https://zookeeper.apache.org/doc/r3.1.2/zookeeperProgrammers.html#sc_timeInZk. Any thought on how these snapshots could be used to enable follow-on work which enables us to build a client API that can guarantee that Accumulo servers have seen some configuration update?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4050
16373	ACCUMULO-4050	bq. I mean an object that is composed of the configuration (set of key value pairs) deserialized from ZK, as well as functions to perform the serialization/deserialization, and which can atomically swap out the reference to the complete configuration. This doesn't really help clarify the things that are vague to me :). Let me try to guess instead; maybe that will help describe what is not clear to me. A table would have multiple containers: one for the dynamic system-wide properties, one for the dynamic namespace-wide properties, and one for the dynamic table-specific properties? And these containers could be merged together (as per the currrent precedence of table > namespace > system)? Or, would the container be abstracting this hierarchy away? bq. By "snapshot", I mean an isolated immutable view of the entire set of configuration (k-v pairs) at a single point in time bq. I suppose we could incorporate the ZNode Version into the snapshot object or its containers somehow I think allowing a snapshot to have know what "time" it was created at would be all that we'd really need. Even if it's just a no-op now (always 0) or just {{System.currentTimeMillis()}}, we could easily swap in the necessary info from ZK down the road to piece together the logic to determine when every server has seen (at least) some update. bq. Any of that would definitely be follow-on work. Yes, completely. My only concern is that if you/Michael step up to do this work, let's look a few feet in front of us to make sure we at least don't make solving the client/server config disconnect harder :) What you have outlined so far sounds like a nice building block to fixing this stupid problem once and for all.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4050
16374	ACCUMULO-4049	How about: 1. Generalizing {{FirstKeyInRowIterator}} to a new class {{FirstPartialKeyInRowIterator}} (or perhaps {{StrippingIterator}}). 2. Modifying {{CountingIterator}} to act as a user iterator, being careful to return entries within the range to which it is seeked. It still just counts entries from its parent iterator. 3. Creating a user convenience class {{CountPartialKeysIterator}}. Internally it creates instances of the above two iterators; no new functionality; all this does is save the user from needing to add two iterator options. It accepts an option for the partial key: null (count all = no need for iterator #1), row (use both iterators), column family (use both iterators), column qualifier (use both iterators), column visibility (use both iterators), timestamp (same as count all), delete key (same as count all; we don't normally see deletes during scans). Client code would look like {code} BatchScanner bs; bs.setRanges(some_ranges); IteratorSetting is = new IteratorSetting(25, "my_row_counter", CountPartialKeysIterator.class); CountPartialKeysIterator.setPartialKey(PartialKey.ROW); bs.addScanIterator(is); long cnt = 0l; try { for (Map.Entry<Key, Value> entry : bs) { cnt += Long.parseLong(new String(entry.getValue().get())); } } finally { bs.close(); } return cnt; {code} I could look at this during the weekend if the plan looks good. This iterator should not be used at compaction time because it is not idempotent. The convenience class {{CountPartialKeysIterator}} is not a perfect solution. It would be better if we created a generic iterator that could load multiple iterators at runtime inside {{init}}, but this is out of this ticket's scope. We can set the default behavior of {{CountPartialKeysIterator}} to count all entries if no iterator option is set. I thought of naming iterator #3 {{CountPartsIterator}}, but this name could lead users to believe that it can count the number of unique column families. The iterator can only count the number of row+family partial keys; counting the number of unique column families requires more complexity and is less suitable for Accumulo's layout.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4049
16375	ACCUMULO-4045	bq. sessions would scale proportional to the number of Connector objects I had initially assumed that you meant a Connector would uniquely own a Session, but I'm not quite sure after reading this :) How do you envision the Session on the client-side mapping to the API? (e.g. would a single session be capable of "backing' multiple Connector objects?).	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4045
16376	ACCUMULO-4045	How do we prevent unauthenticated connectors from piggy-backing on an existing session?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4045
16377	ACCUMULO-4045	bq. I had initially assumed that you meant a Connector would uniquely own a Session, but I'm not quite sure after reading this Right now, creating a Connector is where we store the user's credentials for future operations. We could create a session which could be used across connectors, but I was mostly thinking about an implementation which would have minimal impact on API and user experience. So, that'd basically mean one session per Connector. bq. How do you envision the Session on the client-side mapping to the API? (e.g. would a single session be capable of "backing' multiple Connector objects?). Essentially, a SessionToken would replace the PasswordToken in the ClientContext's Credentials.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4045
16378	ACCUMULO-4045	bq. We can also enforce a same-origin policy, to ensure that the session token is valid only for the client IP address which initiated the request for its construction. This provides additional mitigation against session hijacking. That's a nice perk I hadn't thought about on my own. bq. in future, I wouldn't mind forcing SASL for all connections This is a nice thought. Does the SASLTransport from thrift work with tframedtransport? (maybe that was the ssltransport which didn't work with tframedtransport) I don't remember anymore :)	1	0	https://issues.apache.org/jira/browse/ACCUMULO-4045
16379	ACCUMULO-4040	Do you know what version they were running? And what the error was (i.e. what is the type of {{tablets}} on an IBM JVM)?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4040
16380	ACCUMULO-4040	bq. IBM J9 JVM Do you know the specific version? https://www-01.ibm.com/support/knowledgecenter/SSYKE2_7.0.0/com.ibm.java.lnx.71.doc/user/java_jvm.html seems to show multiple targeted JREs via different "implementations" of the J9 jvm.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4040

#	Requirement	Questions	Answered	Successfully Answered	URL
16381	ACCUMULO-4039	Could you be a little more specific? The current RPC model is Half-Sync, Half-Async (HSHA). So requests and responses are handled asynchronously, but the RPC itself is executed by a shared thread-pool. This is a convenient paradigm to program against. Some things are tricky (like the service blocking on itself for meta services), but most requests are implemented as straight-line code: no callbacks, Futures and other bookkeeping. What limits are you pushing up against, and how would a different design solve it?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4039
16382	ACCUMULO-4022	I'm sorry, I was thinking of the NativeMap. My apologies. I am a newbie. I like these ideas! Thanks! One question, though. Would you envision the sync command being driven by the client or the read/write server?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4022
16383	ACCUMULO-4022	* Need to consider how to load balance scans between the read-write and read-only tablets. * Can there be more than one read-only copy of a tablet?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4022
16384	ACCUMULO-4014	Aside: are we considering killing accumulo-start and getting rid of this nonsense completely for 1.8?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-4014
16385	ACCUMULO-4004	bq. Some folks I'm working with have been wanting this to make replication more predictive. Definitely a nice bonus which gets around a quick of the replication impl. bq. It should be possible to manually roll WALs so that files on decommissioning datanodes are closed and the decommissioning process can complete [~ecn], do you have an explanation for why we even need to do this? I'd like to better understand why we need to change our code.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4004
16386	ACCUMULO-4004	[~dlmarion], are there any relevant sections in the book that should be updated after this change? Have you given this any thought -- it sounds like it would be important/useful for ops people to know about.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-4004
16387	ACCUMULO-3993	To confirm, this would just need to include bloomfilter in core and thrift for the server socket in server (as they both contain javadoc owned by the original copyright holder). The javascript stuff doesn't need anything done because they wouldn't contain anything in the javadoc jars. Anything I missed?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3993
16388	ACCUMULO-3993	Actually, this doesn't seem to be the case on hbase-common. Was that an HBase omission, or is there a reason that copied javadoc over there didn't require an updated NOTICE? bq. jars contain NOTICE file that incorrectly states the aggregate work is copyright the Accumulo project instead of the ASF I do see that the javadoc jars for rc1 (at least core) say "Copyright 2015 Apache Accumulo Project". So the above does apply as well.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3993
16389	ACCUMULO-3993	the issue back in HBase was that there were bundled works in the source/bin jar that didn't impact the javadocs, so the javadocs needed different files. Do all of our included works show up in the javadocs? i.e. I wouldn't expect the jquery / flot stuff to be present.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3993
16390	ACCUMULO-3993	bq. because it references jquery and that isn't present Wait, what? It's not? I thought that would've been brought in via src/main/resources. https://github.com/apache/accumulo/tree/1.5/server/src/main/resources/web/flot Are you sure you did your find correctly?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3993
16391	ACCUMULO-3991	bq. {{+server/src/main/java/org/apache/accumulo/server/util/TNonblockingServerSocket.java}} This file moves around across the branches. I'd prefer to see us just refer to the filename which should be unique. Would be nice to do that for the bloomfilters package, but a bit more difficult. Maybe enumerate those files instead of listing the package? What do you think? Otherwise, the patch lgtm.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3991
16392	ACCUMULO-3991	{quote} We should probably put the generic text of the MIT and BSD licenses in the LICENSE file, so we can just include them once for all bundled software to which that license applies, and move the copyright notices to the NOTICE file. I believe that's the correct way of utilizing these files. {quote} The current patch is done according to the [guidance on properly assembling license and notice files|http://www.apache.org/dev/licensing-howto.html]: permissive licensed works only in LICENSE, ASLv2 licensed works w/NOTICE file in NOTICE. It also only contains a single copy of each of the MIT and BSD-3 licenses referenced. {quote} Hey Sean, the files mentioned in ACCUMULO-3989 are based on old HBase versions of the same (thus the copyright notice in their headers). See http://s.apache.org/JXi for reference; that was a while ago, but some of it is still relevant. {quote} Ah. Should we include a "Portions from Apache HBase" notice in the NOTICE file? HBase didn't have a NOTICE file that included a copyright statement until very recently, so it's almost certain that the version these were copied from didn't include it; I think we'd be fine to just use as-is. Though perhaps a note about the history in the source file would be nice? {quote} bq. +server/src/main/java/org/apache/accumulo/server/util/TNonblockingServerSocket.java This file moves around across the branches. I'd prefer to see us just refer to the filename which should be unique. Would be nice to do that for the bloomfilters package, but a bit more difficult. Maybe enumerate those files instead of listing the package? What do you think? Otherwise, the patch lgtm. {quote} both excellent ideas, let me fix that up.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3991
16393	ACCUMULO-3990	bq. This might involve breaking out what we have in our top-level LICENSE/NOTICE files into those applicable for the specific jars. These would also be different from the javadoc jars (though they should be the same for the source jars) because the javadocs are probably all AL2.0 with no special notices. I thought this was clearly something that needs to be done for the Thrift and Javascript files based on ML discussion. Did I misunderstand?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3990
16394	ACCUMULO-3990	Applied [~busbey]'s addendum. Did the merge work up through 1.6, accounting for the break-out or server into server/*. Didn't verify jar contents in newer branches, but the necessary files should be in the right places now.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3990
16395	ACCUMULO-3982	Some points discussed with [~phrocker] off line: # the tablet servers used to clear the Locator cache after finishing a bulk import request. By switching to once-per-hour in ACCUMULO-3549, this is no longer true. # at larger scales, even once per hour is aggressive. Eventually you are re-reading the metadata table every few seconds, for no reason # the Locator needs more testing: for example, it always uses a single write lock to serialize lookups, which is a bad behavior for random tablet lookups. Locator does some simple read-ahead. Is it enough? Is it too much? # a configurable size-limited LRU cache makes much more sense if the concern is memory usage # TreeMap isn't exactly the most space-efficient store: [~kturner] thinks a 10-byte location entry requires 256 bytes. However, caching a million tablets would only use 0.25G which is not that much if you have a million-tablet Accumulo instance # the main issue [~phrocker] was investigating is ACCUMULO-3835, which has already been fixed in 1.8	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3982
16396	ACCUMULO-3982	bq. he Locator needs more testing: for example, it always uses a single write lock to serialize lookups, which is a bad behavior for random tablet lookups. Locator does some simple read-ahead. Is it enough? Is it too much? We've had a number of requests to get a Locator impl into the public API. Perhaps now would be a good time to refactor it into the API and make sure we can adequately test it? Would be happy to try to help get behind this.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3982

#	Requirement	Questions	Answered	Successfully Answered	URL
16397	ACCUMULO-3982	bq. It would be really nice if we could leverage guava's Caches here [Looks like|http://stackoverflow.com/questions/21966778/is-it-possible-to-iterate-over-a-guava-cache-in-order-of-insertion-access] Guava doesn't ever intend to support any sort of ordering on Cache. Maybe things have changed since that comment though. Generally speaking, what are the requirements/desirables for the locator? * Sorted iteration * Quick lookups * Quick updates * Constant memory WRT number of tablets * Avoid extra object creation/copy (except on cache updates) What else?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3982
16398	ACCUMULO-3982	bq. A quick investigation shows that doubles the data structure size overhead Makes me a little nervous -- doesn't the size of the data structures here affect both servers and clients? Granted, it's probably not a lot of memory total, but still makes me wonder. At first glance, something like Java's ConcurrentSkipListMap makes sense to me (and wouldn't require a lot of effort), but I haven't done enough reading yet to be sure there isn't something better. I wonder how the common access patterns the locator impl uses would affect the overall concurrency of the structure. For example, in the server-failure case, we would invalidate the locations of all tablets for a server which would likely be spread across the entire structure which would probably slow down as concurrency increases. Would being able to store the locations for a tablet close to the other tablets hosted by the same server be noticeably beneficial? bq. Adding and removing a million objects to both only takes ~5s. What did that look like size-wise? ~260MB like you said? Or is that 2*260MB maintaining a cache and a treemap?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3982
16399	ACCUMULO-3982	bq. It took about 0.5G. I also did experiments with a ConcurrentSkipListMap. The TreeMap was slightly faster than a SkipList. The SkipList used slightly less RAM (by a few percent). Cool, thanks for sharing. bq. it would be able to support different concurrent update strategies. I'm sure this would require more testing to see how concurrency pans out. bq. If we have both data structures, we can do our first look-ups on Cache, which will normally find the tablet, and that's a hash lookup, which is significantly faster. So that would be a nice benefit. Using two different data structures to maintain a single cache just comes across as a smell to me. I'm sorry, I know this is coming across as me harping on this approach. Because the locator is guaranteed to be used concurrently, this makes me worry even more about correctly keeping state in two different places over one. In a perfect world, the Locator impl is just holding a single copy of the data in the metadata table. While the Guava Cache interface is nice to use, is it going to be ultimately a more confusing implementation that have a single data structure to cache the metadata table?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3982
16400	ACCUMULO-3974	Thoughts on whether we should do this before we ship the next round of bug-fixes [~ctubbsii], [~ecn], [~kturner]? How critical does changing randomwalk to catch this strike you all?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3974
16401	ACCUMULO-3970	Thinking about the problem in a different way, might it be less intrusive to encode the rules for alternate views of data at ingest time and then push down the logic to deduplicate columns with multiple visibilities? I think this would prevent the need to inject down in the system visibility code and perform the merge/filter in "userspace iterators". For your DOB example, the table would actually contain both records: {noformat} (pt_id, demographic, pt_dob, PII_DOB) -> "1925-08-22" (pt_id, demographic, pt_dob, SHD_DOB) -> "1925" {noformat} At scan time, if the user has the ability to view this patient's personal data, they would scan with the PII_DOB visibility. Otherwise, they'd only have the SHD_DOB visibility. In the former case, you'd want to only present one value for demographic:pt_dob (not both) "1925-08-22". This lets you perform this filter on the server instead of unwinding it on the client. It does require logic in the driving application to assign the visibilities accordingly, but I think your original suggestion would also require this.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3970
16402	ACCUMULO-3970	Thanks for your comment, Billie. I see what you mean about not wanting to rely on the table admin to manage data visiblities. I guess my use case could be summarized as, "As a user of Accumulo, I want to be able to put sensitive data into the system, and have different users see different views of that data in accordance with organizational policy". Flipping it around, you're not relying on the data producer to get de-identification "right". In my mind it's a valuable feature, but I get that I be in a minority among Accumulo's users in wanting it.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3970
16403	ACCUMULO-3961	GitHub user rweeks opened a pull request: https://github.com/apache/accumulo/pull/42 Implementation of SeekingFilter, CfCqSliceFilter and CfCqSliceSeekingFilter OK let's try this again. Right bug id this time. Implementation for ACCUMULO-3961 including a filter which behaves similarly to the existing ColumnSliceFilter but can seek to the next potential match instead of explicitly rejecting every KV pair that falls outside the slice. Probably faster for small slices on large rows. Christopher switched the fix version to 1.8, I guess because adding new functionality should go into a minor release. So I'm targeting this against the master branch, because it doesn't look like a 1.8 branch exists yet. I know you guys require this to be rebased into a single commit. Is that something I can do on my side (I'm concerned about rebasing after I've pushed this to a public repo) or is that something you can do when you receive the pull request? You can merge this pull request into a Git repository by running: $ git pull https://github.com/phemisystems/accumulo ACCUMULO-3961 Alternatively you can review and apply these changes as the patch at: https://github.com/apache/accumulo/pull/42.patch To close this pull request, make a commit to your master/trunk branch with (at least) the following in the commit message: This closes #42 ---- commit a0c8d588109e2d8d0b3bdf862ec1d3e1e48c50e7 Author: Russ Weeks <rweeks@phemi.com> Date: 2015-07-23T03:53:01Z Initial commit of CfCqSlice code. Renamed files but Java class names are messed up. commit 9cc2c28251d445c86d7006bf1237ea2fd096b4e1 Author: Russ Weeks <rweeks@newbrightidea.com> Date: 2015-07-23T04:23:12Z Removing cyclic dependency on MiniAccumuloCluster by moving tests to test module commit 1100ba49ee09c97aadbe80429f54a13519a98552 Author: Russ Weeks <rweeks@newbrightidea.com> Date: 2015-07-23T05:48:12Z Reformatted and added comment to SeekingFilter commit e5ea222fa07ab8bb7211a12c87aa127146874f81 Author: Russ Weeks <rweeks@phemi.com> Date: 2015-07-24T00:20:08Z Slice tests passing commit f579acc4e60b7aa5cf36c59fad51ea36347204f0 Author: Russ Weeks <rweeks@phemi.com> Date: 2015-08-13T17:21:31Z Added class-level javadoc, fixed problem with OptionsDescriber commit dc2655622f71676012cf849a849e2e89fd936d26 Author: Russ Weeks <rweeks@phemi.com> Date: 2015-08-13T17:44:38Z tweaking the javadoc. ----	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3961

16406	ACCUMULO-3952	Should there be an error if the script is unable to check the well-known directory for the jar in question, but it doesn't matter because all the necessary classes are in a jar in CLASSPATH already when the script is launched? How much of a problem is it that the jars aren't in the expected directory? Is it always a "fail loudly" situation, or only if CLASSPATH is empty when the script starts? How much checking can we actually do to ensure the classpath is properly set up before the JVM launches and it tries to load a class?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3952
16407	ACCUMULO-3952	bq. Should there be an error if the script is unable to check the well-known directory for the jar in question, but it doesn't matter because all the necessary classes are in a jar in CLASSPATH already when the script is launched? I didn't think we supported users setting CLASSPATH and then calling Accumulo scripts. If that does work, it's news to me and I would call it an undocumented/subject-to-change feature. bq. How much of a problem is it that the jars aren't in the expected directory? Is it always a "fail loudly" situation, or only if CLASSPATH is empty when the script starts? Very much of a problem? It's a fail very poorly situation if the log4j jar can't be found. I had to try very had to get a stacktrace. bq. How much checking can we actually do to ensure the classpath is properly set up before the JVM launches and it tries to load a class? I think it's very trivial to check the "start" classpath (slf4j and log4j) which is all I intended to check. Maybe accumulo-start too?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3952
16408	ACCUMULO-3952	bq. If that does work, it's news to me and I would call it an undocumented/subject-to-change feature. I fixed that with ACCUMULO-3685, because it was a long-standing issue, and I was correcting the bootstrap classpath issues. So, it has worked that way since at least 1.7.0 (but probably not before). I suppose it is an undocumented feature, but it's one I'd expect for a Java app. After all, I wouldn't exactly consider it normal behavior for a launch script to clobber-and-ignore standard user preferences/environment variables that affect the behavior of the thing it is launching, especially a "PATH" environment variable, where it is typical to append/prepend vs. clobber. bq. Very much of a problem? It's a fail very poorly situation if the log4j jar can't be found. I had to try very had to get a stacktrace. I agree it's definitely a problem. I suppose I was trying to ask how much of a problem that the script doesn't do the check vs. Java doing the check. Either way, the error needs to be more prominent. I'm just not sure to what extent we can preemptively check for required classes in the scripts, when the classes could be in different jars. I guess I was trying to ask whether we should consider these "required" locations, or "expected" locations, which would determine slightly different behavior and messages. bq. I think it's very trivial to check the "start" classpath (slf4j and log4j) which is all I intended to check. It's trivial to check for files with particular names, but it's less trivial to check for required classes being contained in those jars. So, this goes back to my question about "required" vs. "expected". Do we require that those specific classes be loaded from jars in those specific locations by those specific names? How much checking are you thinking is needed? At a certain point, Java's going to do a much more thorough checking than we could, for the requisite classes. Maybe it's just better to ensure that the CNFE is propagated better from Java, rather than implement our own checking? Or maybe we still want to do a minimal "sanity check" to see if the file with the expected name exists?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3952
16409	ACCUMULO-3952	I don't think it's wise to check for log4j in the environment. We've been slowly making our way toward pure slf4j-api consumption, and if log4j doesn't exist then the proper behaviour is "no logging" or possibly "print a warning to stdout/err" but never "fail quickly/loudly/somehow." What do you envision this verification doing, Josh?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3952

#	Requirement	Questions	Answered	Successfully Answered	URL
16410	ACCUMULO-3952	bq. I don't think it's wise to check for log4j in the environment. We've been slowly making our way toward pure slf4j-api consumption I don't understand the hesitation. The same goes for the slf4j jars. If they can't be found, we can't reasonably expect to run Accumulo at all. bq. What do you envision this verification doing, Josh? {{bin/accumulo}}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3952
16411	ACCUMULO-3952	Checking for slf4j is fine, since we advertise our dependency on it. I would like to believe that somebody can swap out our log4j jars and use logback or another implementation and Accumulo would still run mostly fine. Some functionality like monitor log forwarding might be missing, but it should still run. {quote} bq. What do you envision this verification doing, Josh? bin/accumulo {quote} What, not where. As in "if verify fails, then... stop process? print error? prompt for intervention?"	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3952
16412	ACCUMULO-3952	If it doesn't exist in the expected directory, but the classes can be loaded from the user-specified CLASSPATH, do you still want this error to occur? Do we really want it to be absolutely required to exist in this specific directory under all circumstances?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3952
16413	ACCUMULO-3952	Would CLASSPATH being set be a sufficient condition to disable the check? That's the only case I can imagine where the we can reasonably expect it to be okay that we didn't find the expected jar(s) in the expected location(s). I'm not sure there's much added value for providing another env variable to control this.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3952
16414	ACCUMULO-3948	Thanks for posting the WIP patches, Dave. Can you add them to reviewboard (or make a PR on github) when you get them ported to 1.8.0, please? It would be appreciated.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3948

Appli which leverage the user of custom properties should take these warnings into consideration. There is no enforcement of these warnings via the API. +==== Configuring the ClassLoader + +Accumulo loads classes from the locations specified in the +general.classpaths+ property. Additionally, Accumulo will load classes +from the locations specified in the +general.dynamic.classpaths+ property and will monitor and reload them if they change. The reloading +feature is useful during the development and testing of iterators as new or modified iterator classes can be deployed to Accumulo without +having to restart the database. + +Accumulo also has an alternate configuration for the classloader which will allow it to load classes from remote locations. This mechanism +uses Apache Commons VFS which enables locations such as http and hdfs to be used. This alternate configuration also uses the ++general.classpaths+ property in the same manner described above. It differs in that you need to configure the ++general.vfs.classpaths+ property instead of the +general.dynamic.classpath+ property. As in the default configuration, this alternate +configuration will also monitor the vfs locations for changes and reload if necessary. + +===== ClassLoader Contexts + +With the addition of the VFS based classloader, we introduced the notion of classloader contexts. A context is identified +by a name and references a set of locations from which to load classes and can be specified in the accumulo-site.xml file or added +using the +config+ command in the shell. Below is an example for specify the app1 context in the accumulo-site.xml file: + +[source,xml] +<property> + <name>general.vfs.context.classpath.app1</name> + <value>hdfs://localhost:8020/applicationA/classpath/.*.jar,file:///opt/applicationA/lib/.*.jar</value> + <description>Application A classpath, loads jars from HDFS and local file system</description> +</property> + +The default behavior follows the Java ClassLoader contract in that classes, if they exists, are loaded from the parent classloader first. +You can override this behavior by delegating to the parent classloader after looking in this classloader first. An example of this +configuration is: + +[source,xml] +<property> + <name>general.vfs.context.classpath.app1.delegation=post</name> + <value>hdfs://localhost:8020/applicationA/classpath/.*.jar,file:///opt/applicationA/lib/.*.jar</value> + <description>Application A classpath, loads jars from HDFS and local file system</description> +</property> + +To use contexts in your application you can set the +table.classpath.context+ on your tables or use the +setContext()+ method on Scanner --- End diff -- What is the "context" that would be passed to `setContext(String)`?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3948

Do it when setClassLoader is called. Or do it when the thrift calls startScan and continueScan are made. An exception could be added to these thrift calls. How were you thinking of doing the check? For getting server side table props you can look into the implementation of `TableOperations.getProperties()`	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3948
16423	ACCUMULO-3944	I think I added this in ACCUMULO-514 when I noticed the system doing nothing for a bit of time when there was work to be done. I think the checks are usually just against in memory data structs and very quick (there may be cases where the checks go to hdfs). Were you seeing performance problems with this code?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3944

#	Requirement	Questions	Answered	Successfully Answered	URL
16424	ACCUMULO-3925	I think there are lots of places in the FateOps that throw ThriftTableOperationException (henceforth TTOE). But only a few were ignored. Did you go look at all of the TTOEs and only decide on those? I ask because another strategy could be to supply FATE a list of Exeception types not to warn on. For example ask FATE to never warn on a TTOE. This is not as clean as letting the FateOp decide.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3925
16425	ACCUMULO-3918	How is this different than between two files? You can't know exactly when the ZK props changed or when they propagated to the tserver. The fact that two locality groups share the same file says nothing about how those locality groups are expected to behave with respect to each other. I can understand the desire to have a consistent iterator stack for a single file... I just can't see how it would affect the user experience, because they don't know which data gets written to which file, or which locality groups are co-located in the same files anyway (we don't expose that to them, and it's not formally defined, nor is it guaranteed to not change). If this is considered a bug, then why isn't it considered a bug that this can happen between sequential compactions to different files (rather than just different locality groups)? I guess I'm just not understanding the use case. FWIW (not much), I typically advise people in situations where this matters, to take the table offline, change the table configuration, and then bring it back online.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3918
16426	ACCUMULO-3918	Well, once you have a consistent iterator stack for the whole file, you can log the iterator stack for the file (which would be follow on work). This would describe what iterator settings were in place when the file compacted. This is not the same as sequential compactions of different files because files are apparent to users. It's how users think about the data on disk. They would track that a major compaction happened and it outputted a file. I wouldn't expect the iterator stack to allow changes midway through a scan, why would I design things to change midway through a compaction. And telling people to offline their tables is horrible advise. That's a issue we should strengthen, not tell people to suffer through.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3918
16427	ACCUMULO-3918	bq. And telling people to offline their tables is horrible advise. That's a issue we should strengthen, not tell people to suffer through. Well, it's the only consistent thing we have at the moment... It's not ideal, but it does work. Can you ensure consistency for what you describe here given the race-conditions for ZK-propagation in general? The problem as you described it seems simple enough to fix, but I haven't looked to see if we'd just be kicking the can down the road.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3918
16428	ACCUMULO-3918	bq. you can log the iterator stack for the file (which would be follow on work) This sounds interesting for debugging purposes. Is there an existing ticket for this? Also, it seems you could just do the same thing per locality group, too. bq. files are apparent to users. It's how users think about the data on disk. I disagree. Files have nothing to do with the user's data model, and unless they are administering their own cluster, I don't know many users who even realize their is a relationshp between their data and the files stored on disk. Locality groups, on the other hand, at least have a loose relationship with the data model, because they are sets of column families. That's not to say they're not important... especially for performance and administration/debugging, of course. In any case, in your scenario, you're still going to have multiple current files for a tablet which have been potentially compacted with different iterator stacks. I don't see how that's fundamentally different than locality groups being compacted with different iterator stacks, unless you're only talking about full major compactions. Are you only concerned about those? (If so, that would go a long way towards my understanding your scenario.) bq. And telling people to offline their tables is horrible advise. That's a issue we should strengthen, not tell people to suffer through. I don't think it's "horrible advise[sic]". It's the best advice possible, given that it's pretty much the best guarantee we can give. I do agree it's insufficient, since there's not an online sync option available. I believe it's been proposed before to offer an online solution for ZK property sync, via the API... maybe an option to clear ZooCache for all the per-table properties.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3918
16429	ACCUMULO-3918	bq. We know that ZK has a defined window for propagation, Is that true? We know ZK has a defined window to maintain its session, but I don't think we have a defined window for any particular set of observers on a ZK watcher to complete and the ZooCache/TableConfiguration to be updated.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3918
16430	ACCUMULO-3913	What's the tangible benefit for users that you're going for here, Keith? I assume this is just one piece of a bigger picture. Took a quick glance at your branch, is there a reason that the Sampler isn't a specialization of SKVI? Seems very close to what Filter already does.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3913
16431	ACCUMULO-3913	bq. What's the tangible benefit for users that you're going for here, Keith? I assume this is just one piece of a bigger picture. Over the years I have heard multiple request for sampling. Recently someone was asking about the feasibility of supporting scanning the RFile indexes as an approximate sample. This was interesting idea, but it bugged me that different rfile indexes would have different subsets of keys. So if one RFile index had a key that was deleted in a later RFile, you would likely not see the delete. So I started thinking about pre-generating a sample that had a consistent set of keys. bq. is there a reason that the Sampler isn't a specialization of SKVI? Seems very close to what Filter already does. I have not put a lot of thought into this particular aspect. I mainly wanted to do a quick end to end prototype to see if there were any big gotcha's with the overall idea. One issue w/ using Filter for the sample function, may be that seek support is not needed.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3913

16437	ACCUMULO-3903	Is this work best done here or in HTrace libraries? Not sure I understand the boundaries well enough.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3903
16438	ACCUMULO-3903	bq. Is this work best done here or in HTrace libraries? Not sure I understand the boundaries well enough. (hopefully I don't get it wrong) Accumulo is a "SpanReceiver" which means that its an endpoint that receives Spans from clients that did timings. Clients include public API, server-side Accumulo functionality, HDFS, or your personal code. Accumulo has indexing functionality for writing those spans to a table (the Accumulo table). This is what backs the monitor. I think there is work going on in HTrace (via htraced) which is backed by LevelDB that is intended for small-to-medium based deployments. IMO, it makes sense to maintain our own SpanReceiver (since we have this scalable distributed database already over leveldb), but it does result in duplication of presentation efforts between Accumulo and htraced.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3903
16439	ACCUMULO-3903	bq. ...but it does result in duplication of presentation efforts between Accumulo and htraced. Does there have to be duplication? HTRACE-180 is trying to separate the display webapp. Could Accumulo use the HTrace UI running against Accumulo as a span store? (Would have to implement a few REST calls for the UI to pull on).	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3903
16440	ACCUMULO-3903	bq. Does there have to be duplication? HTRACE-180 is trying to separate the display webapp Absolutely not, you're right -- that was a bad assumption of me to paint. bq. Could Accumulo use the HTrace UI running against Accumulo as a span store? Not sure how much work this would be. I'd have to take a look at htraced to see what it would actually take. Would be nice if we could just drop in Accumulo w/ the necessary REST service.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3903
16441	ACCUMULO-3903	I don't have a pressing need to have a solution right at this minute, so I would be interested in waiting for the development in Htrace webapp to stabilise. It seems like it would be a good approach to have one presentation. [~elserj], just wondering what is the status of the redevelopment of the monitor in (ACCUMULO-3005)? Do you think that this would work with displaying the Htrace GUI inside of the Accumulo monitor and still keep a consistent look and feel (i suppose that this could be addressed through css)? [~stack], would any work need to be done to the Htrace webapp to make it more suited for embedding it in other webapps? If so, would you like tickets created to cover this in Htrace Jira?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3903
16442	ACCUMULO-3903	[~Lonepine] bq. would any work need to be done to the Htrace webapp to make it more suited for embedding it in other webapps.... To be seen. Currently we just build a WAR. I've not tried deploying it in a 'container'. If you get to it before I, file issues against HTrace. What is there we know basically works for its what the htraced span receiver is putting up as UI.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3903
16443	ACCUMULO-3903	bq. just wondering what is the status of the redevelopment of the monitor in (ACCUMULO-3005)? Do you think that this would work with displaying the Htrace GUI inside of the Accumulo monitor and still keep a consistent look and feel (i suppose that this could be addressed through css)? [~Lonepine] it's essentially stalled. I was happy with the direction it was heading, but I haven't touched it in a long time. Would like to get back to it again. I'm not sure the level of effort to pull in two wars and spin things up that way. Look and feel can be something we address later on -- functionality is still first and foremost. If this is something you're interested in pursuing, let's try to firm up a plan that we think is the correct way forward and we can scope it out :)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3903
16444	ACCUMULO-3899	Are you up to date? Im pretty sure I fixed this already.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3899
16445	ACCUMULO-3899	I am not (probably a week behind), can you close this with a dupe against the fixing ticket?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3899

#	Requirement	Questions	Answered	Successfully Answered	URL
16446	ACCUMULO-3891	Cool, thanks. I figure that if we can include as much as possible w/o being a burden, that will simply interactions with it (less to think about 'will this page actually load in $deployment')	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3891
16447	ACCUMULO-3871	I see you committed a change to master which moved all of the integration tests from src/test/java to src/main/java. Can I ask why you did that? It seemed like the approach you were heading towards was creating a special fatjar with all of the stuff you needed to avoid libjars taking forever. It's not apparent to me why you needed to move the ITs to src/main as you could have just used the accumulo-test-$version-tests.jar. I'm concerned about not having our test code in the normal location to just support something that is not going to be generally used by everyone (most people won't have many nodes to run the ITs via mapreduce) Thanks.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3871
16448	ACCUMULO-3871	Thanks for the link. I missed that point from Eric's original point. Any suggestions on how can we prevent ITs from showing up against in test/src/test/java? Checkstyle rule? Developer section in the user manual? Email?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3871
16449	ACCUMULO-3858	Looks like you already made a similar change in master, [~ecn]. Was this specifically for the new WAL znodes? {code} commit 3fdd29f5222f9d1d32ca28b5ecf1d740a8d20f87 Author: Eric C. Newton <eric.newton@gmail.com> Date: Fri Apr 24 18:15:05 2015 -0400 ACCUMULO-3423 optimize WAL metadata table updates diff --git a/test/src/test/java/org/apache/accumulo/test/functional/WatchTheWatchCountIT.java b/test/src/test/java/org/apache/accumulo/test/functional/WatchTheWatchCountIT.java index 3b1dd2f..140fd59 100644 --- a/test/src/test/java/org/apache/accumulo/test/functional/WatchTheWatchCountIT.java +++ b/test/src/test/java/org/apache/accumulo/test/functional/WatchTheWatchCountIT.java @@ -52,7 +52,7 @@ public class WatchTheWatchCountIT extends ConfigurableMacIT { String response = new String(buffer, 0, n); long total = Long.parseLong(response.split(":")[1].trim()); assertTrue("Total watches was not greater than 500, but was " + total, total > 500); - assertTrue("Total watches was not less than 650, but was " + total, total < 600); + assertTrue("Total watches was not less than 675, but was " + total, total < 675); } finally { socket.close(); } {code}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3858
16450	ACCUMULO-3851	I thought client configuration was added in 1.7.0? Was it added in a 1.6.z?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3851
16451	ACCUMULO-3851	could we add it to the 1.6.0 release notes then? I don't see any mention of it there. I think it came in as a part of ACCUMULO-1009, but it's a big addition with a non-obvious relationship.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3851
16452	ACCUMULO-3842	As I see it, we have two main non-transient use cases for ZooKeeper: # Bootstrap information (primarily, ZooKeeper serves as an entry point for clients communicating with Accumulo). # Information which needs some degree of distributed consistency. A lot of the configuration falls into the second category (soon-ish consistency with ZK watchers and ZooCache). I think there's probably some stuff we could move over, but I also see other ways we can address some of those benefits you mention. * Loss of ZK configuration could be handled with some sort of snapshotting. * The number of watchers could be reduced greatly by changing our strategy for storing stuff. We could either have a single "watched" node (or one per table) and update that node when we make any other change. That would reduce the need to have as many watchers. We could also serialize table configuration a bit better (one node instead of many), which would also help address ACCUMULO-1568. I'm not sure how the change proposed would manifest the third benefit you mention (consistent updates of table props). Can you explain that, please? As I understand it, we use ZooKeeper, because it has watchers, which we can use to get consistency. I'm not aware of any similar mechanism with any alternatives.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3842
16453	ACCUMULO-3842	Thanks for taking a read over this (very) bare outline so far. bq. I'm not sure how the change proposed would manifest the third benefit you mention (consistent updates of table props). Can you explain that, please? As I understand it, we use ZooKeeper, because it has watchers, which we can use to get consistency. I'm not aware of any similar mechanism with any alternatives. So, right now, we have eventually consistent configuration updates for tables. We don't know when the watchers will fire, but (IIRC) we know they will fire in the correct order and ever server will eventually see all updates. What we should really have to mimic the API we present is a strongly consistent means to update configurations. ZooKeeper doesn't keep us from accomplishing this. We would need to write code to actually get the strong consensus for ourselves. I know this is very hand-wavy at this point, but I think we're at the point where this is a problem we need to start thinking about because it's been a repeated problem for ourselves just in writing reasonable tests for Accumulo for ~2years now.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3842
16454	ACCUMULO-3842	{quote} What we should really have to mimic the API we present is a strongly consistent means to update configurations. ZooKeeper doesn't keep us from accomplishing this. I know this is very hand-wavy at this point, but I think we're at the point where this is a problem we need to start thinking about because it's been a repeated problem for ourselves just in writing reasonable tests for Accumulo for ~2years now. {quote} Once it's finalized, could we leverage the recent HBase procedure store for this (ref HBASE-12439)?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3842
16455	ACCUMULO-3842	bq. Once it's finalized, could we leverage the recent HBase procedure store for this To the best of my understanding (which is lacking), I wasn't aware of procv2 solving this problem for HBase. Am I mistaken?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3842
16456	ACCUMULO-3842	bq. ZooKeeper doesn't keep us from accomplishing this. We would need to write code to actually get the strong consensus for ourselves. Isn't this statement is true for HDFS also? Wether using zookeeper or HDFS, config needs to be cached on tservers for efficiency. For most operations config is not changing, do not want to make a synchronous read to ZK of HDFS before servicing each RPC. I think we need something at the API level to address this, regardless of implementation. bq. but I think we're at the point where this is a problem we need to start thinking about because it's been a repeated problem for ourselves just in writing reasonable tests for Accumulo for ~2years now. Yes, this is a big problem, lets fix it. I think ZK provides primitives that make adding an Accumulo API to wait for tservers to synch config to a certain point fairly easy to implement. I think a good place to start is thinking what the API solutions for this would look like. Some possible API changes : # Add something like {{waitForConfigSynch(long timeout, TimeUnit tu)}} to the API. If it times out could throw an exception w/ info about the tservers that did not update. # Change behavior of current methods that change config to wait for all tservers to sync (I don't like doing this, would rather leave the current behavoir). # Add a new method that allows setting a batch of key/value configs. This method would also wait for changes to sync across tservers. Something like {{updateConfiguration(Map<String, String> propsToSet, Set<String> propsToUnset, long timeout, TimeUnit tu)}}. Of course pass in class instead of 4 params. I kinda like 3. What other API changes could solve this?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3842

16457	ACCUMULO-3842	{quote} bq. ZooKeeper doesn't keep us from accomplishing this. We would need to write code to actually get the strong consensus for ourselves. Isn't this statement is true for HDFS also? Wether using zookeeper or HDFS, config needs to be cached on tservers for efficiency. For most operations config is not changing, do not want to make a synchronous read to ZK of HDFS before servicing each RPC. I think we need something at the API level to address this, regardless of implementation. {quote} I haven't put nearly enough thought into this (nor reading necessary literature), but my original thought was to use Accumulo tables as much as possible for the persistence (and wrap the access in some classes to make everything more natural). If we keep a notion of monotonically increasing versions for configs, a FATE op could wait for each server to report at least a minimal version. Discerning the "end" state might be difficult in the face of servers dying and starting...	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3842
16458	ACCUMULO-3842	bq. Loss of ZooKeeper doesn't lose table configuration and users Is this a genuine problem for users? Keeping configuration information in ZK is pretty much ideal from my perspective.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3842
16459	ACCUMULO-3842	{quote} bq. Loss of ZooKeeper doesn't lose table configuration and users Is this a genuine problem for users? {quote} IMO, we don't have enough rigor here to actually make me comfortable to tell someone that we have the means to backup and restore ZooKeeper. I know we have some tools, but I don't know how much this is actually used and tested. Ideally, it would be better if we can have a single way to backup data for an Accumulo cluster and later restore it (import/export table is a likely candidate for simplicity). Perhaps removing table configuration in ZK isn't a good idea, but I definitely think users information should not be stored in ZK.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3842
16460	ACCUMULO-3842	bq. I definitely think users information should not be stored in ZK. Do you just mean the user password/authorizations/permissions database? Those are already pluggable and do not have to live in ZK. It would be a pain to put them inside Accumulo, creating a bit of circular dependency which would be prone to concurrency problems, but it could be doable. Do you have a strong reason you can express for changing the default behavior of storing this in ZK? Or is it just the lack of good comprehensive backup/restore tools which you've already mentioned (which seems to me to be an easier problem to solve)? From my perspective, ZK seems to be a relatively solid component. Because of that, it seems to me that burden is on any alternative to demonstrate a greater degree of reliability, scalability, or other benefit.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3842
16461	ACCUMULO-3842	{quote} Do you have a strong reason you can express for changing the default behavior of storing this in ZK? Or is it just the lack of good comprehensive backup/restore tools which you've already mentioned (which seems to me to be an easier problem to solve)? {quote} One side of it is that I think the more we can store in tables, the easier it is for users to reason about. Having as much data as we can stored in Accumulo itself would be easier for users to say "how is X stored?". Another aspect is the scalability side. We know that making the problem fit in ZK's constraints is often an exercise to interacting with it at scale. We can likely do better scalability-wise in Accumulo itself. We probably aren't at that point where we _need_ to do this yet, but it's something to keep in mind. {quote} From my perspective, ZK seems to be a relatively solid component. Because of that, it seems to me that burden is on any alternative to demonstrate a greater degree of reliability, scalability, or other benefit. {quote} I'm pretty sure we already have solved the reliability and scalability problems in Accumulo itself. A bit of eating our own dogfood by leveraging a table. We're better suited at storing a larger category of data than ZooKeeper is (e.g. we can store larger blobs of data). Just to be clear: I think this has kind of broken down into two separate discussions already. One is the configuration consistency issue which I think we're all in agreement on needs to happen. The latter is my general opinion that we should start moving away from ZK as our "general not-table-related-data" store which deserves the continued discussion about what the actual observed benefits would be, short term and long term (and how, if at all, the two are related).	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3842
16462	ACCUMULO-3841	What you propose might be possible. However, it's not just NativeMapIT which requires the native maps to be built. Many other tests probably rely on timing which only works reliably if the native maps are enabled (I suppose we could adjust these, as we find them). The dependency in the test pom on the native maps artifact would have to be moved to a profile (perhaps activated by the presence of the native maps). I'm not 100% sure the extent of this impact on our tests. Personally, I think it's reasonable to consider it a build requirement to have `make`, `g++`, and `javah` installed in order to build Accumulo. I am curious why the build proceeded at all if `make` failed, though. Was this in Jenkins or some other system where maven was executed with `--fail-at-end`? Otherwise, I'm not sure why accumulo-native would continue to be built.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3841
16463	ACCUMULO-3841	bq. I am curious why the build proceeded at all if `make` failed, though. Was this in Jenkins or some other system where maven was executed with `--fail-at-end`? Otherwise, I'm not sure why accumulo-native would continue to be built. Oh that might have been the case, actually. Thank you for debugging for me :P	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3841
16464	ACCUMULO-3840	That's a great idea and I'll work on it. I think there are a few other things that can go into the sub-class to help clean things up. One thing that I did notice is that OpTimer is only ever used at TRACE level (except for a test case) - even in a place or two where the comments say that for performance, logging should not be done. - That would seem to indicate that tracing would not be appropriate at that level and may for all of OpTimer usages. The reason that I didn't go further in this round with tracing is so that it will be done with consideration and consistently. The thing to do would be to get a feeling for where we need to measure client operations and then add them sort of top / down. Are you thinking nanoTime instead of currentTimeMillis? I thought about borrowing the Guava StopWatch / Ticker to approach to allow us to swap time sources, but then figured that it would be superseded by tracing and that nanos where unnecessary with the precision that we need and the fact that these are hardly ever used.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3840

#	Requirement	Questions	Answered	Successfully Answered	URL
16465	ACCUMULO-3840	bq. One thing that I did notice is that OpTimer is only ever used at TRACE level (except for a test case) - even in a place or two where the comments say that for performance, logging should not be done. - That would seem to indicate that tracing would not be appropriate at that level and may for all of OpTimer usages. Oh interesting. That's a fun comment. I imagine a bit of work to go into _good_ instrumentation. We have it sprinkled around, but could likely benefit from a planned visitation of the public API impl. bq. Are you thinking nanoTime instead of currentTimeMillis? I thought about borrowing the Guava StopWatch / Ticker to approach to allow us to swap time sources, but then figured that it would be superseded by tracing and that nanos where unnecessary with the precision that we need and the fact that these are hardly ever used. I remember reading something about how using nanoTime was better than currentTimeMillis for timings. Maybe it was https://blogs.oracle.com/dholmes/entry/inside_the_hotspot_vm_clocks {quote} If you are interested in measuring absolute time then always use System.currentTimeMillis(). Be aware that its resolution may be quite coarse (though this is rarely an issue for absolute times.) If you are interested in measuring/calculating elapsed time, then always use System.nanoTime(). On most systems it will give a resolution on the order of microseconds. Be aware though, this call can also take microseconds to execute on some platforms. {quote} The only other thing I'd request is to try to keep OpTimer/StopWatch improvements and consolidations as separate as possible from the log4j/slf4j switchover. We don't have a hard rule for one-change-per-commit, but it definitely helps if you can do that.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3840
16466	ACCUMULO-3840	Why is there a PR and something on RB?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3840
16467	ACCUMULO-3807	I agree with [~ctubbsii] having progress sit at %100 is worse than a moving indicator with funny looking numbers. Having numbers > than 100% does look odd, but as long as it is moving it reflects that recovery is working and will eventually (hopefully) complete. If it was clamped at 100% and then hung for any significant amount of time (maybe > 30 seconds), well I'm likely to start to panic that something else is wrong with the system. First, something happened that caused log recovery, and now log recovery is hanging.... With 1.4.x versions I seem to recall recovery taking minutes in "bad" cases. If the recovery indicator was at 100% for that amount of time it would certainly cause me concern. Maybe instead of a %, the number shown is # copy / sort operations? While it would be nice to know about how long things were going to take, if it can be estimated - otherwise it seems more important to provide feedback and reflect that things are still progressing - whatever form that is.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3807
16468	ACCUMULO-3795	Maybe {{table.scan.max.latency}} to keep some consistency with {{table.scan.max.memory}} instead of {{table.scan.flush.ms threshold}}? We already have nice parsing for {{TimeDuration}} in {{Property}}s. Don't need to specifically set ms. Sounds like a good addition though.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3795
16469	ACCUMULO-3793	bq. Do this by default in the start scripts. I'm not sure I'm a big fan of trying to change kernel parameters in our start scripts (nor sure how it would work as I assume you need root privileges). Wouldn't something like this be better served in a "System Configuration" section of the user manual which could also include things like disabling transparent huge pages, reducing swappiness, etc?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3793
16470	ACCUMULO-3774	Is anyone working on this one yet? I have some cycles I can start looking into this.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3774
16471	ACCUMULO-3774	It does not seem patch #1 covers the general case that the root tablet tries to write to itself after minc. Why should the root tablet should write to itself? [~elserj] saw another place where the root tablet writing to itself was causing problems.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3774
16472	ACCUMULO-3774	The problem (as I'm working through it): # at some point a tserver figures out that a WALog is no longer in use: * it is closed * no tablet has a references to it * the log is marked as unused to signal to the GC that the file can be removed # one of the likely times a log goes unused, is during a shutdown # at that point (but there are others) the metadata table is not available Some ideas: * mark the log *eventually* asynchronously * keep the log references in zookeeper only * use HDFS to track the logs, avoid the metadata table So, can zookeeper handle this? * a tablet server can theoretically ingest as fast as the WAL can write, which is the speed of HDFS * let's be an optimist and use a write rate of 128M/s * this allows for a log roll every 8 seconds on our magic hardware * let's assume a big cluster size: 10K nodes * each rollover updates zookeeper 3x: create, unused, deleted * 10K*3/8 = 3750 updates / sec * assuming 100 WALogs per server, and 500 bytes for each entry: 0.5G * based on published numbers (I found [this|http://wiki.apache.org/hadoop/ZooKeeper/Performance]), it looks like this would be easily do-able, even on quorum large enough to handle this magic cluster * I'm pretty sure the NN (or several of them) can keep up, since they are handling the WALs creation/deletion anyhow What are the benefits to each possible solution? Async: * async updates would require a recovery, probably for every "clean" shutdown Zookeeper: * we'll have to sync to avoid propagation delays (like knowing the full log set before recovery starts) * probably some other problems, zookeeper doesn't always act like I think it should NN: * using the NN to track files was not a particularly scalable approach, but it would be easy, and the multi-volume support allows us to abuse the NN a little more * given the current logging area {{/accumulo/walogs/host+port/UUID}} we would need some way for a restarted server to begin logging before all recovery has completed At this point, I'm leaning towards marking logs as unused by renaming them in HDFS, and storing them under the host+port+session. This eliminates the entry for the log from the metadata table altogether.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3774
16473	ACCUMULO-3774	Would it make things easier if we pinned a specific WAL _just_ for the root tablet? We could have a single place in ZK to track that and then specific logic for tservers. I'm not sure how much more complexity that would add though. Then we should use ZK+sync to make sure we always have a consistent view of the WAL for root (and have some great logging whenever we do something to it).	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3774
16474	ACCUMULO-3771	Github user ctubbsii commented on the pull request: https://github.com/apache/accumulo/pull/35#issuecomment-99120050 There are two main problems with the Eclipse formatter: 1. It doesn't strictly adhere to the line length restrictions. 2. It adds a trailing space to indent empty javadoc lines. We've already accounted for the line length in the checkstyle rules by making it much larger than the Eclipse formatter. With this patch, I think we could probably just ignore trailing whitespace (and drop the corresponding checkstyle enforcement), since the formatter will remove the ones we mainly care about anyway (the javadoc ones are annoying, but there's not a lot of good options so long as Eclipse fails to fix that issue). We could just strip whitespace with `sed` after the formatter executes. One thing I'd like to see, though (for the purposes of a review) is just the pom changes, separate from any resulting formatting changes (I'm sure I can do this with some command-line Git Fu, though, so it's no big deal). I did see that the formatting significantly changed some lines that looked deliberately formatted to make it more readable. For those lines, we may wish to add the `@formatter:off` / `@formatter:on` tags to retain existing formatting. I'm also curious what happens with the `-Pthrift` profile activated. Will this plugin reformat the generated thrift code? Maybe that's okay, but it might be annoying. If the generated thrift code were in a separate package, it could be avoided more easily, though. I'm overall +1 to the idea, but it might need some tweaking. I especially like the idea that we could focus our style choices on readability, because writing to conform to a particular style doesn't matter any more (write in whatever style you like and the build will fix it).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3771

16475	ACCUMULO-3771	Github user keith-turner commented on the pull request: https://github.com/apache/accumulo/pull/35#issuecomment-99123399 > One thing I'd like to see, though (for the purposes of a review) is just the pom change The PR has two commits. Commit 4b69fba has just pom changes. Is that what you are looking for? > It adds a trailing space to indent empty javadoc lines. Would you happen to know if this if fixed in later versions of Eclipse? This formatter plugin currently [relies on Eclipse 3.8.1](https://github.com/mblanchette/maven-java-formatter-plugin/blob/0.4/pom.xml#L66) code to do the formatting.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3771
16476	ACCUMULO-3771	Github user mikewalch commented on a diff in the pull request: https://github.com/apache/accumulo/pull/35#discussion_r29801880 --- Diff: maven-plugin/src/it/plugin-test/pom.xml --- @@ -113,6 +113,13 @@ </execution> </executions> </plugin> + <plugin> + <groupId>com.googlecode.maven-java-formatter-plugin</groupId> + <artifactId>maven-java-formatter-plugin</artifactId> + <configuration> + <configFile>${project.basedir}/../../../../contrib/Eclipse-Accumulo-Codestyle.xml</configFile> --- End diff -- What is LF?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3771
16477	ACCUMULO-3770	Where do these reports go? Are they rolled-over like the regular logs? The timeliness feature is nice, but that can be done in a separate SimpleTimer callback. Knowing the status of GC in a long-running, time-sensitive server is very important. I would be hesitant to remove it.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3770
16478	ACCUMULO-3770	Was talking with Bitweasil in IRC yesterday/today about this. He expressed some confusion about the GC logging we had. After digging, he found that we were actually logging the cumulative time spent in GC, not the time of the last cycle as expected. bq.Where do these reports go? Are they rolled-over like the regular logs? Typically, you'll get a {{gc.log\[\-date\]}} style file, but I believe this is also configurable. bq. The timeliness feature is nice, but that can be done in a separate SimpleTimer callback. Agreed. Timeliness check is very good and should be considered separate to GC logs. bq. Yeah, rollover is nice. Also does what java prints out have timestamps? Yes. Here are some examples from the logs that HDP creates for the secondary namenode: {noformat} 2016-09-14T09:57:00.476+0000: 54036.340: [GC (Allocation Failure) 2016-09-14T09:57:00.476+0000: 54036.340: [ParNew: 106050K->1130K(118016K), 0.0680896 secs] 125622K->20712K(1035520K), 0.0683270 secs] [Times: user=0.13 sys=0.00, real=0.07 secs] 2016-09-14T12:12:44.975+0000: 62180.839: [GC (Allocation Failure) 2016-09-14T12:12:44.975+0000: 62180.840: [ParNew: 106090K->1157K(118016K), 0.0503738 secs] 125672K->20742K(1035520K), 0.0505503 secs] [Times: user=0.10 sys=0.00, real=0.05 secs] 2016-09-14T14:51:46.898+0000: 71722.762: [GC (Allocation Failure) 2016-09-14T14:51:46.898+0000: 71722.762: [ParNew: 106117K->697K(118016K), 0.0705879 secs] 125702K->20662K(1035520K), 0.0707647 secs] [Times: user=0.14 sys=0.00, real=0.07 secs] {noformat} Another perk is that we can use standard tools for parsing these logs. Here is a nice little article that explains how to read these lines https://plumbr.eu/blog/garbage-collection/understanding-garbage-collection-logs	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3770
16479	ACCUMULO-3769	Huh. The work for YCSB Accumulo I did ended up at https://github.com/brianfrankcooper/YCSB Which looks like it's diverged?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3769
16480	ACCUMULO-3761	Thanks for the patch, [~rweeks]! {code} + kvBufSize += sourceTopKey.getSize() + sourceTopValue.getSize() + 128; {code} This was a curious addition that caught my eye. It looks like you copied this from {{TransformingIterator}} (given [~kturner]'s recommendation on the ML thread). Keith, is this just a constant to account for general object size overhead? Otherwise this looks really great! The test case is nice. One nit is that {{testEncodeAll}} doesn't have the JUnit test annotation, but that's something I can add before commit.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3761
16481	ACCUMULO-3761	[~rweeks] courtesy ping: any chance you can look into this failing test? Does it pass locally for you? This would be nice to add for 1.7.0, but isn't a big issue if it gets pushed to 1.7.1 (since our public API doesn't include iterators presently).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3761
16482	ACCUMULO-3761	Patch applied. Thanks, [~rweeks]. Can I add you to our contributors page w/ TZ and/or employer?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3761
16483	ACCUMULO-3751	Thanks [~medined], you pointed me to an idea. Column families are distinguished because they can be used for locality groups. Beyond that, the other fields are effectively laid out next to each other. Why distinguish between the parts of a Key that are considered indexable, versus the Value that is considered non-indexable? If we laid out in a single byte[] the {{row-colF-colQ-colVis-timestamp-delete-value}}, then we can sort on the value just as if we had a comparison by {{PartialKey.ROW_COLFAM_COLQUAL_COLVIS_TIME_DEL_VAL}}. The use of a column qualifiter is then a place to put information that sorts before column visibility and timestamp are considered. There's nothing preventing us from putting the source/parent field you suggest in the column qualifier position, value position or some other position (as long as we delimit the "fields" in the byte[] or track positions). When I describe Accumulo to friends, I tell them that "everything is a byte[]" that can be interpreted however you choose. This sounds like a greater realization of that motto. As for geographic data, the best data layout schemes for those are use things like Z-order curves and Hilbert curves, which seem hard to do in the current Accumulo. Were you thinking of something that would help with these, or perhaps something more elaborate?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3751
16484	ACCUMULO-3751	Out of curiosity, will you be at Accumulo Summit this week, [~denine99]? Was thinking that we could block out some time at the hackathon to brainstorm in person if you are. If you aren't, we could try to set up a video hangout (since there will at least be _some_ critical mass of devs there in person).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3751
16485	ACCUMULO-3720	You mentioned generating the report and optionally failing the build in the description and your last comment. What did you end up committing? Can you provide some details on how this does (or does not) affect the build process, please?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3720
16486	ACCUMULO-3720	Great, thanks for writing this up. I'm sure I'll be back to reference it. It sems like we're collecting a nice suite of automated tools that can be run at build time to help enforce good code at commit rather than release (findbugs, checkstyle, RAT, apilyzer). Tangential, it may be good to think about a developers section on the user manual to cover these (what do they do, what are failure conditions, how do you fix them, etc).	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3720
16487	ACCUMULO-3720	Each plugin has its own documentation to link to (for most of those, the URL is documented in its own pom, as well as searchable in Google), if we do add such documentation. I don't know how much it's worth it to document the build plugins we're running, because the reasons for running them tend to be self-evident (e.g. the reasons we're using them is contained in the description of each), and I can't really think of what documentation would be useful beyond that and a link to the plugins' own documentation. Is there something beyond those things which you think might be valuable to put in said documentation? (BTW, if we were generating/publishing the maven site, a listing of our plugins, with links to their docs would be auto-generated. For example: http://code.revelc.net/zookeeper-maven-plugin/plugins.html)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3720
16488	ACCUMULO-3703	Fixes up the Environment to construct the correct AuthenticationToken. Doesn't address anything in the security module yet -- will deal with that in a separate ticket since it'll be a big rewrite.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3703
16489	ACCUMULO-3700	bq. configuration that maps namespaces to tablet servers What are your thoughts on defining tablet servers? Hostname regex or list? Something else?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3700

#	Requirement	Questions	Answered	Successfully Answered	URL
16490	ACCUMULO-3698	Chritopher, I was thinking about tight integration of Lucene with Accumulo. So that lucene can read and write to and from accumulo tables. I jsut want to use Lucene capabilities in Accumulo So that the over all system would be fast and scalable and does not limited by Lucene. Taking it as an example seems like you are using lucene independently to store index and Accumulo to store Documents. Is it the case?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3698
16491	ACCUMULO-3681	Github user joshelser commented on a diff in the pull request: https://github.com/apache/accumulo/pull/24#discussion_r26906707 --- Diff: core/src/main/java/org/apache/accumulo/core/client/impl/ScannerIterator.java --- @@ -92,13 +92,13 @@ public void run() { return; } } catch (IsolationException | ScanTimedOutException | AccumuloException | AccumuloSecurityException | TableDeletedException | TableOfflineException e) { - log.trace(e.getMessage(), e); + log.trace("{}", e.getMessage(), e); --- End diff -- General question: is it worth inserting the formatting string when there isn't any concatenation happening?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3681
16492	ACCUMULO-3665	You had mentioned to me in chat before that you wanted to figure this one out before you got the parent committed. Is this ready to be closed out now or do you still have more debugging to do here? Thanks.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3665
16493	ACCUMULO-3662	To be clear, the Makefile does the extracting from the environment. We could modify the Makefile to print a reasonable error message instead of build_native_library.sh. Under what circumstances have you seen this, though? When a JDK was not installed?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3662
16494	ACCUMULO-3662	I think we can add a quick check to verify {{$JAVA_HOME/bin/javah}} exists in the Makefile, right? That should be sufficient to determine if the JAVA_HOME points to a JDK. After that, we can just assume the JNI headers are in the include directory. We could check for the JNI headers directly, but that may not be as platform-independent as checking for the existence of javah. Do we need to do this check on Darwin also, or just Linux? I mean, can we assume Darwin has a JDK installed, or no?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3662
16495	ACCUMULO-3652	Can you give some details on this? I don't mind working on it if I understand what the goal is.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3652
16496	ACCUMULO-3652	There are several place in the core and shell that set the logging level during runtime which slf4j does not support. Example from o.a.a.core.client.mapred.AbstractInputFormat log.setLevel(logLevel); Does anybody have an idea how to refactor this with using slf4j? I've seen some hacks mentioned online but nothing looks enduring.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3652
16497	ACCUMULO-3652	I'm through all the modules except accumulo-test with the first (i.e. "easy") pass and should complete that tomorrow. Shall I create another issue to complete the hard parts of log4j replacement and/or client supplied logger?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3652
16498	ACCUMULO-3652	Will do. I'm almost done with accumulo-test so I'll wrap it up tomorrow and push the changes. BTW its going to be a huge change set; is a patch okay or should I get some credentials and push the branch to the repo and do a PR?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3652
16499	ACCUMULO-3652	Either patch or PR is fine. Are you familiar with ReviewBoard? If it's large and complex, that may be useful, too: https://reviews.apache.org/	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3652
16500	ACCUMULO-3652	OK, I've got rbt tools installed. How you guys create the diff file to upload to the review board?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3652
16501	ACCUMULO-3652	I was trying to figure out how to mark it "patch available" and used the Fixed status which marked it resolved. How did you mark it "patch available"?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3652
16502	ACCUMULO-3652	I've worked through the first round of the review board issues. Shall I update the patch attached to this issue, remove it all together, or wait till the review is over before updating it?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3652
16503	ACCUMULO-3652	I'm not sure what happened, but once again, the updated patch seems to contain a lot of unrelated changes from a merge. Do you have a branch on GitHub I can take a look at instead? Perhaps I can see if I can figure out how to make ReviewBoard happy?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3652
16504	ACCUMULO-3652	Looks like your patch includes a merge conflict file: {{server/tserver/src/main/java/org/apache/accumulo/tserver/tablet/Tablet.java.orig}} Are these changes necessary? {code} diff --git a/server/tserver/src/main/java/org/apache/accumulo/tserver/TLevel.java b/server/tserver/src/main/java/org/apache/accumulo/tserver/TLevel.java index 1c3e43f..7a15577 100644 --- a/server/tserver/src/main/java/org/apache/accumulo/tserver/TLevel.java +++ b/server/tserver/src/main/java/org/apache/accumulo/tserver/TLevel.java @@ -17,6 +17,7 @@ package org.apache.accumulo.tserver; import org.apache.log4j.Level; +import org.apache.log4j.Priority; import org.slf4j.Logger; public class TLevel extends Level { @@ -25,31 +26,31 @@ public class TLevel extends Level { public final static Level TABLET_HIST = new TLevel(); protected TLevel() { - super(Level.DEBUG_INT + 100, "TABLET_HIST", Level.DEBUG_INT + 100); + super(Priority.DEBUG_INT + 100, "TABLET_HIST", Priority.DEBUG_INT + 100); } static public Level toLevel(int val) { - if (val == Level.DEBUG_INT + 100) + if (val == Priority.DEBUG_INT + 100) return Level.DEBUG; return Level.toLevel(val); } static public void logAtLevel(Logger log, Level level, String msg, Object...objects) { switch(level.toInt()) { - case TLevel.DEBUG_INT: + case Priority.DEBUG_INT: log.debug(msg, objects); break; - case TLevel.ERROR_INT: - case TLevel.FATAL_INT: + case Priority.ERROR_INT: + case Priority.FATAL_INT: log.error(msg, objects); break; - case TLevel.INFO_INT: + case Priority.INFO_INT: log.info(msg, objects); break; - case TLevel.TRACE_INT: + case Level.TRACE_INT: log.trace(msg, objects); break; - case TLevel.WARN_INT: + case Priority.WARN_INT: log.warn(msg, objects); break; } {code} I think you got all of the occurrences of extra braces. 16506	ACCUMULO-3643	Bump, didn't see any sort of ACK on this. When might you be able to fix these?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3643
16507	ACCUMULO-3633	[~elserj] some thoughts as I read over it. If you make a 2nd revision, would you mind putting it on RB? * init section : iterator config can come from other places than table config * Instantiation section : Could also mention per table classpath. Also could mention that one should not seek source in init() * Iterator design section : List is mentioned, could also mention Tree of iterators. Also could use Tree terminology in deepCopy section. Could mention deepCopy() should be called in init() * explain isolation, data sources do not change until top iterator returns key/value, could move [html isolation iterater documation|https://github.com/apache/accumulo/blob/1.6.2/docs/src/main/resources/isolation.html] to this new section in user manual * in addition to combiner and filter, could mention transforming iterator * next section : does it have to be a cached key value? * could explain why cross row operations are not recommended * hasTop section : java iterators have nothing similar to hasTop Some code like the following showing how tserver will call iterators for a scan may be useful. {code:java} List<KeyValue> batch; Range range = //range from client while(!overSizeLimit(batch)){ source = systemIterator() for(SKVI iter : iterators){ iter.init(source, opts, env) source = iter } //read a batch of data to return to client topIter = iterators.last() topIter.seek(range, ...) while(topIter.hasTop() && !overSizeLimit(batch)){ key = topIter.getTopKey() val = topIter.getTopValue() batch.add(new KeyValue(key, val) if(systemDataSourcesChanged()){ //code does not show isolation case, which will keep using same data sources until a row boundry is hit range = new Range(key, false, range.endKey(), range.endKeyInclusive()); break; } } } //return batch of key values to client {code}	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3633
16508	ACCUMULO-3622	It looks like that will erase and rewrite everything under the user node for the root user. Can we quantify what will be destroyed by reseting the perms for system, namespace, etc? I think since we're talking about the root user those all get ignored maybe?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3622
16509	ACCUMULO-3621	Ok, I'm still perplexed, [~ctubbsii]. For STANDALONE, {{testDirList}} indexes ACCUMULO_HOME on the local node. Where were you getting /tmp from? Looks like I might have forgotten to update the comment in the test case. Perhaps that was throwing you? {code} case STANDALONE: dirListDirectory = ((StandaloneAccumuloCluster) getCluster()).getAccumuloHome(); {code}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3621
16510	ACCUMULO-3621	bq. Where were you getting /tmp from? From 1.6. Apparently 1.7 and later diverged from the old behavior.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3621
16511	ACCUMULO-3617	The same log statement which logs this message logs all the other incoming requests at the debug level also. It's in a "checkPermission" method, so it's trying to provide some auditing information for debugging permissions checks. Should we just move these all to trace or should we remove all of them? Or, should the unloadTablet message be specifically suppressed and the others shown?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3617
16512	ACCUMULO-3617	IMO, is there a purpose to auditing unloadTablet with the understand that the master will repeatedly spam it until the server actually responds to the request? Without more information, I don't think it makes sense to log it at all. If it actually included the extent in question, I could see it at TRACE. Given that it's in a checkPermission block, I think the intent was not to debug the fact that the server saw an unloadMessage, but more that it allowed an unloadMessage which, IMO, is useless.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3617
16513	ACCUMULO-3615	Is this another cance we could benefit from Curator and their PathChildrenCache?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3615

#	Requirement	Questions	Answered	Successfully Answered	URL
16514	ACCUMULO-3602	Left some commits on your most recent commit in that branch. Thanks for sharing, [~echeipesh]! Some bigger concerns that we'll need to talk through: * Resource management on the BatchScanner. Are we sure that it will get closed? I might have just missed it happening elsewhere (via ScannerBase). * All of the MapReduce classes/interfaces/etc under `org.apache.accumulo.core.client` are (painfully) considered to be in the public API. Since we're following semver, it's unlikely that we'll be able to make this change 1.6.3 as you've currently targeted. We'd have to go for 1.7.0. The mapred/mapreduce classes often fall into this gray area where we don't *really* want them all to be public API, but they got grandfathered in. We'll have to keep this in mind. * The duplication between RangeInputSplit and MultiRangeInputSplit is painful (I think you called this out to begin with). Maybe there's some more consolidation that can be done with RangeInputSplit? I'm worried about it because we've had a couple of bugs come out of RangeInputSplit due to the duplicative code and insufficient testing. As far as testing, you can try to take a look at AccumuloInputFormatIT.java. That has a good example of running a "mapreduce" job over a MiniAccumuloCluster. You could also check out the MiniMRYarnCluster class provided by Hadoop/YARN itself which should hopefully give you a more realistic test environment (as opposed to using the local MR runner). ExamplesIT.java also has some examples of running MR jobs against Accumulo which you could look at. In short, the more you can unit test, the better. A test or two to ensure high-level functionality would be good IMO.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3602
16515	ACCUMULO-3602	Thank you for the review, I've made those adjustments. Just to spell out the issue, we can't change the RangeInputSplit interface because it would break semver, but by the same token adding MultiRangeInputSplit to the same package also breaks semver as it's not available in 1.6.2. This feels a little weird since the InputSplits are only ever used by the InputFormat, as I understand it. Can you see any way that this functionality making it into 1.6.3? If it's really not possible then the best approach is to have a universal InputSplit by combining functionality of the two and create appropriate reader based on split values and roll that into 1.7.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3602
16516	ACCUMULO-3602	bq. Just to spell out the issue, we can't change the RangeInputSplit interface because it would break semver, but by the same token adding MultiRangeInputSplit to the same package also breaks semver as it's not available in 1.6.2 You got it. bq. This feels a little weird since the InputSplits are only ever used by the InputFormat, as I understand it. I hear you, but the concern for RangeInputSplit is that someone else could have extended it and your changes might break them. As for the addition of MultiRangeInputSplit, this is just strictly prohibited by semver as 1.6.3 should only contain bug-fixes. bq. Can you see any way that this functionality making it into 1.6.3? Sadly, I don't think so. Perhaps it's some consolation that 1.7 should happen in the next month or two? We've kind of been twiddling our thumbs on the matter. IMO, we should start pushing it out. bq. a universal InputSplit by combining functionality of the two and create appropriate reader based on split values and roll that into 1.7. Interesting, have you given thought into the logic that would control when either is used? I remember seeing some experiments where replacing the Scanner with a BatchScanner had very positive outcomes (obv you're one of them), but I wonder if it's always true? We should try be cautious in changing how the InputFormat works (even from 1.6 to 1.7).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3602
16517	ACCUMULO-3602	Alright, 1.7 target it is then. I'll rebase on master. I'll code up a merged InputSplit to see what it would looks like. My intuition would be to be cautious and have a specific flag for the use of BatchScanner in cases when split has more than one range. There is still no way to support offline and client side scans using BatchScanner, so it doesn't cover all cases. The logic would be similar to what happens now except the branch will be on split property rather then split class. Should it be the default approach when possible? I'm not sure, probably yes. Locality would be tied to a tablet, which is hosted on one machine, you still can reap the benefits of several IO threads. The effort on querying the TabletLocator is spent in either case, so why not use it.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3602
16518	ACCUMULO-3602	bq. Alright, 1.7 target it is then. I'll rebase on master. Cool. Thank you, and again, sorry for the pain semver is causing. bq. Should it be the default approach when possible? I'm not sure, probably yes. Locality would be tied to a tablet, which is hosted on one machine, you still can reap the benefits of several IO threads. The effort on querying the TabletLocator is spent in either case, so why not use it. As long as the Split generation is still binning the ranges together on locality, I think this would be fine for most cases. There's still the possibility that tablets move the mappers read them, but that's nothing new. One case I thought of is that a Mapper could have special logic based on the fact that it will receive sorted Key-Value pairs which a BatchScanner-by-default would break. I'm not sure how common this is nor if it's a big concern. My cautious nature would be to say that it's safest to have 1.7 introduce configuration that allow use of BatchScanners and then 2.0 could switch that to the default? A nice enum could help make a setter which ensure API compat between 1.7 and 2.0 and let the default configuration change underneath. Haven't thought it through completely, just a first reaction. [~kturner] is really good at this stuff. Maybe he can weigh :)	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3602

16535	ACCUMULO-3602	Github user joshelser commented on the pull request: https://github.com/apache/accumulo/pull/25#issuecomment-91035731 > It seems like this change could encourage users to pass many ranges as configuration for the map reduce job. This could cause memory exhaustion for the job tracker. Agreed, but is this a new issue? If anything, it this these changes would reduce the total number of objects in memory (as a split could contain multiple ranges whereas previously it was 1:1). I remember hearing about solutions that use HDFS as a mechanism for supporting large numbers of ranges instead of the Configuration. Either way, I think the current changes are a good addition but just not in scope to address the bigger issue you brought up.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3602

#	Requirement	Questions	Answered	Successfully Answered	URL
16536	ACCUMULO-3602	Github user keith-turner commented on the pull request: https://github.com/apache/accumulo/pull/25#issuecomment-91038638 > Agreed, but is this a new issue? I think the intent of this PR is new. I think the intent is to efficiently support a map reduce job that reads from many small ranges. If we are going to do that, then lets do it in a way that scales better. > However, I still think that for many things, it's probably better to simply use an iterator with some filter criteria. This approach would work well for existing input format. The only drawback to this approach is it requires adding custom iterators to tservers classpaths. The batch scanner approach allows efficient reads of many small ranges from a tablet w/o custom iterators. Just need a custom function in the map reduce job to generate the ranges.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3602
16537	ACCUMULO-3602	Github user ctubbsii commented on the pull request: https://github.com/apache/accumulo/pull/25#issuecomment-91038876 > Agreed, but is this a new issue? I wouldn't think so. I think it highlights a better implementation to satisfy the underlying use case than the one currently being proposed in this PR.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3602
16538	ACCUMULO-3602	Github user joshelser commented on the pull request: https://github.com/apache/accumulo/pull/25#issuecomment-91041003 > > Agreed, but is this a new issue? > I think the intent of this PR is new. I think the intent is to efficiently support a map reduce job that reads from many small ranges. If we are going to do that, then lets do it in a way that scales better. Re-reading the issue description, yes, you are correct. However, what Eugene has already done is already an improvement over what currently exists, IMO. Assuming that the majority of Ranges that his Spark workflow creates are non-overlapping (a hunch given the subject matter -- very small boxes of interest), this still reduces the total memory use of splits and Ranges. The worst case would be numerous very large ranges. We're never going to have the ideal solution the first time around -- I just don't want this to stall because we come up with a different solution to an already solved problem. I'm happy to continue the discussion for dealing with large numbers of ranges efficiently, I'm just not convinced this is the place to do it.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3602
16539	ACCUMULO-3602	Github user joshelser commented on the pull request: https://github.com/apache/accumulo/pull/25#issuecomment-91049205 > If its not discussed now, then it will likely not be later. 1.7.0 will be released, and we will be supporting these API changes for a long time How do these changes preclude you from later adding in your proposed split generation code?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3602
16540	ACCUMULO-3602	Github user keith-turner commented on the pull request: https://github.com/apache/accumulo/pull/25#issuecomment-91049787 > How do these changes preclude you from later adding in your proposed split generation code? They do not. I am just thinking about maintenance over time. If the approach of passing a function is a better solution to the problem at hand, then only we only implement it and have less code to maintain.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3602
16541	ACCUMULO-3602	Github user echeipesh commented on the pull request: https://github.com/apache/accumulo/pull/25#issuecomment-91641526 @keith-turner I don't think the range decomposition interface approach would handle my case without some kind of intermediate storage level, as I am reading it anyway. The Range -> List<Range> interface does not have enough parameters to determine the query plan. Also, if the query is user generated then a named class can not be present to encapsulate the parameters. From this standpoint it seems there are two options - Use some presence that is that would be populated by the query planner - Perhaps the Configuration object would still need a value to find the correct location - Expand the interface to to include some kind of `QueryConfiguration` interface that could be implemented by the user and would be passed in. The second approach sounds more interesting but it's hard to judge it since I don't think I have that problem. To clarify, what is the underlying concern, that the Configuration object gets too large and the (de)serialization becomes too expensive or not even possible? My particular use case is reflection on the fact that small ranges introduce too much overhead when they translate to mappers (in MR) and partitions (in spark). So it would be nice if there is some kind of minimum batch, tablet maps nicely to that. The only other addition to this problem, which is not explored in this PR, is to divide sequence of ranges per tablet server into "balanced", user configurable, number, of groups. Balanced in this case could mean something like: approximately equal number of possible row results. The idea would to be to match "x mappers per host" design. Sounds like it would be great, but I haven't tested anything like that yet, could be another PR if it works out?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3602

Should it be downgraded to a warning, since interaction between auto-adjust and batch scan is a "soft" change in the behavior?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3602
16546	ACCUMULO-3602	Github user joshelser commented on the pull request: https://github.com/apache/accumulo/pull/25#issuecomment-94060780 Actually, compat is still broken with that setupIterators method. Do you want to fix that @echeipesh or should I just do when I apply the rest of your changes?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3602
16547	ACCUMULO-3599	I got to a point where all of the ITs are passing with a normal MAC and a MAC which is using Kerberos via Hadoop's MiniKdc. There were a few tests (those which tried to run MapReduce) which I just ignore when we're running with Kerberos on as I haven't figured out how I can actually get these working (do I just need to construct an inline Configuration with the necessary properties?). The short of it is that new ITs which only perform some task as the "root" user shouldn't have changed. Use the {{getConnector}} method and things should be fine -- the test harness will do the work for you depending on the environment. If the test uses multiple users, doesn't anything with user mgmt (e.g. {{createLocalUser}}), then things get a little different. Still a TBD to update the docs. A secondary goal of the above was to make sure that the changes made to support MAC w/ or w/o Kerberos also support a standalone cluster with Kerberos. I've already found an issue in the first test class I ran, so I anticipate more changes to come, but I wanted to get this in while I know it's in a good state. As always, if you notice new test failures, feel free to open a new issue and assign it to me.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3599
16548	ACCUMULO-3594	Can you clarify what you mean by "message classes"?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3594
16549	ACCUMULO-3594	bq. Alternatively, we could rely on Avro's generic serialization implementation (but it's a little slower). I'm not sure what this means. Can I lazy-internet you and ask for a "why avro" overview/blog/paper?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3594
16550	ACCUMULO-3592	What makes you say this? I'm suggesting we do this now so that it doesn't become a pain point later on. If we introduce the construct to move away from writables, it should allow the same support we have now, but guarantee a bit more backwards compatibility.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3592
16551	ACCUMULO-3591	Specifically the rolling-up of iterators and their options into a single ZNode? If we wanted to keep ZK readable (which I know has been stated as a big concern by others), we could use the JSON protocol for Thrift or protobuf-json for protocol buffers. Not directly related to your comment, just something related I wanted to mention before I forgot.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3591
16552	ACCUMULO-3591	Just for completeness, Avro also has a JSON serialization mode. Is there a reason folks prefer human-readable ZK instead of providing tools that can read a binary serialization?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3591
16553	ACCUMULO-3590	Is it possible to do a manual rolling upgrade from 1.6.2 to 1.72? Let say bring up 1.7 tablet servers then shutdown the 1.6? Or is data serialization currently a problem across the 2 versions?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3590
16554	ACCUMULO-3590	bq. The SystemToken is created using properties of 'instance' to create a hash. Some of these properties are created by default creating a unique hash between different versions. Oh, we added new "instance.*" properties to the configuration between 1.6 and 1.7? Bummer. We'll probably have to rethink how we compute the SystemToken in the future to account for this scenario. Probably another sub-task for this umbrella.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3590
16555	ACCUMULO-3590	Regarding this, what would the process for shutdown, upgrade, start up look like? My problem is that accumulo continually restarts the tablet server after a short interval (give or take 2 minutes) when using stop-here.sh. I don't expect to need to update accumulo that often, but would be nice to be able to do this one node at a time.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3590

#	Requirement	Questions	Answered	Successfully Answered	URL
16556	ACCUMULO-3590	bq. Regarding this, what would the process for shutdown, upgrade, start up look like? Exactly what you described. Some kind of shutdown step, upgrade of JARs on the given node, and restart of that node again. Movement of tablets hosted by the node being upgrade is the most difficult part to efficiently implement. bq. My problem is that accumulo continually restarts the tablet server after a short interval (give or take 2 minutes) when using stop-here.sh Huh? Accumulo does not automatically restart services out of the box. There are ways that you can configure the system to automatically restart stopped processes, but that's definitely not standard functionality.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3590
16557	ACCUMULO-3586	Do you know if the following would work? (I don't have a good way to test) {code} bin/bootstrap_config.sh -o -d target/example-configs/$s/standalone -s $s -j -v 2 >> $out 2>&1 {code}	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3586
16558	ACCUMULO-3579	[~ctubbsii], can you take a look? {{mvn verify -Psunny}} passed for me.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3579

16560	ACCUMULO-3567	Looks good, Keith. A couple of ideas: * Introduce what a TabletBalancer is when introducing the topic * How does someone use the GroupBalancer? Do they write their own implementation? Is it configuration based? * Another example could be tracking website traffic. Similar to geographic distribution, evenly spreading out the analytic records for multiple sites hosted by one organization (e.g. org1 => foo.com, bar.com, foobar.com, org2 => google.com, yahoo.com, etc). Same premise, just different application.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3567
16561	ACCUMULO-3565	Where can I find these dashboards?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3565
16562	ACCUMULO-3560	How can we create the Accumulo-equivalent of https://mms.mongodb.com or https://mongolab.com? These are hosted database solutions. mms.mongodb.com has an agent that will run on your local box to install mongo. mongolab.com is a front-end to AWS and other cloud providers.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3560
16563	ACCUMULO-3557	Who would be authorized to write here? If there are multiple instances sharing the same zookeeper (which I think is crazy-talk, but we support it) then it's not like a single instance secret is authoratative enough to make changes. Maybe the best we can do is just place an ACL on each individual znode and leave {{/instances}} open.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3557
16564	ACCUMULO-3557	bq. Restricting write access would be difficult, since the whole point of this name-to-id mapping paradigm was so somebody could easily re-initialize an instance with the same name, without clobbering an existing instance. In practice, how often is this actually used? I don't think I've ever done this in the years I've used Accumulo. I only see re-init'ing done when I'm destroying the instance. bq. And, the new instance could have a different instance secret, so what ACL do we use? Obviously, we would want to use the current instance.secret (since that's what the rest of the instance nodes would be acl'ed with). The problem would be knowing what the old instance.secret was to remove the old znode. The first thought I have is to have a password-prompt when we get an AuthFailed removing the old ZNode. The administrator running the reinitialization can enter whatever the old secret was. bq. The risks here are how it affects clients. Yes, that was my original concern. Users being redirected to a different Accumulo instances -- maliciously or otherwise. Anyone has the ability to change these nodes which means that anyone with access to the system can prevent users from normally accessing it by just nuking this node.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3557
16565	ACCUMULO-3557	bq. In practice, how often is this actually used? It *may* be useful for testing. However, I think it would be *more* useful to simply say something like "An instance was already created with that name. If you'd like to overwrite it, enter it's name here to confirm: " in order to conveniently remove the old one.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3557
16566	ACCUMULO-3557	Do we have a test for this?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3557
16567	ACCUMULO-3548	{{KeyExtent}} is one that kind of worried me, because it's really not "well consumed". Does it make sense to pull a KeyExtent into the public API to just provide some stability? Or, should we try to make a better class which is well suited for public consumption in the public API which KeyExtents can be converted into?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3548

#	Requirement	Questions	Answered	Successfully Answered	URL
16568	ACCUMULO-3537	If we really need a separate property, I like [~kturner]'s suggestion of {{instance.volumes.replacements.relative}}. What do you think, [~elserj]?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3537
16569	ACCUMULO-3537	[~ctubbsii], what's the status here. Is this going to make 1.7.0?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3537
16570	ACCUMULO-3528	bq. we may want to wait until Hadoop bumps their dependency too. Do we know what version of Hadoop would contain this? 2.7.0? It's tough because we're either broken "now" or "later" WRT HDFS spans. Will our code still run against the old htrace and the new incubating htrace runtime dependencies (e.g. can the user swap in the htrace impl they want to use on the classpath w/o having to recompile the code)?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3528
16571	ACCUMULO-3528	Overall it makes sense. Track the newer htrace stuff, and versions of HDFS which also use the new htrace libs will automatically start showing up in Accumulo. It encourages use of newer versions of HDFS and, hopefully, reduces our burden. Getting HDFS spans in Accumulo isn't a requirement, just a nice to have. Some quick observations: {code} + SpanReceiverBuilder builder = new SpanReceiverBuilder(wrapHadoopConf(conf)); + SpanReceiver rcvr = builder.spanReceiverClass(className.trim()).build(); + if (rcvr == null) { + log.warn("Failed to load SpanReceiver " + className); } + receivers.add(rcvr); + log.info("SpanReceiver " + className + " was loaded successfully."); } {code} Looks like you want an else after the {{if (rcvr == null)}} if-statement. This will print that it failed to load the spanreceiver, and then that it loaded it. {code} @Override public synchronized boolean offer(Runnable e) { - task.add((Comparable) e); + task.add((TraceRunnable) e); notify(); return true; } {code} In {{CompactionQueue}}, maybe add a {{Precondition}} check instead of a blind cast? At least we can give a better error if we ever get a Runnable that wasn't a TraceRunnable? I see in {{AsyncSpanReceiver}} and {{ZooTraceClient}} the {{configure(HTraceConfiguration)}} method has gone away. Was that nuked in o.a.htrace? The configure method was nice because it made the constructors do less "work" which typically makes it easier to test those classes with mocks.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3528
16572	ACCUMULO-3528	Is there more work to be done, or can we close this now?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3528
16573	ACCUMULO-3521	Can these be deprecated? OrIterator definitely has some bit rot. At least if we deprecate it could bring to light if they are used to not.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3521
16574	ACCUMULO-3521	[~ctubbsii] With the updates in PR #237, Josh's in https://github.com/apache/accumulo/pull/247 and the test I added in https://github.com/apache/accumulo-examples/commit/bec846ce3dec6b594e5e54a1349a99f5202dd91b can I mark this resolved? I think the other methods in (4.) have been removed.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3521
16575	ACCUMULO-3521	Sure. Any progress at all on this will have been useful. Can always re-run UCDetector again in the future.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3521
16576	ACCUMULO-3521	For the items removed in 2.0, are they marked deprecated in 1.8.x?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3521
16577	ACCUMULO-3520	1.7.0 is already released. Also, this is marked as "Fixed" rather than "Duplicate", but has a link indicating this is a duplicate of ACCUMULO-3209. I'm confused. Which ticket, and in which version was the work actually done?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3520
16578	ACCUMULO-3508	[~phrocker], I've added you as a contributor. Look forward to a patch -- thanks!	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3508
16579	ACCUMULO-3508	What's the status of this? Is a patch available? [~phrocker], are you still working on this?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3508
16580	ACCUMULO-3508	Should this be backported to 1.6.5 and/or 1.7.1, since it was originally reported against 1.6.0?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3508
16581	ACCUMULO-3490	The shell servlet integration seems like a separate, follow-on issue. What would it take to get this to work?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3490
16582	ACCUMULO-3490	bq. The shell servlet integration seems like a separate, follow-on issue Perhaps. My guess is that it would be very trivial to enable. bq. What would it take to get this to work? I haven't yet looked into what Hadoop presently does to enable this.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3490
16583	ACCUMULO-3479	I applied most of [~ctubbsii]'s attached patch in addition my changes. Thanks for the help!	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3479
16584	ACCUMULO-3477	bq. What worked really well was extending TThreadedSelectorServer, creating threads for ops I knew would be fast, and leaving things like a "startScan" or a "continue(Multi)Scan" handler to the thread pool. It required more coupling of the server to the processor/handler, but ultimately worked really well. Oh, cool. Thanks for sharing, [~phrocker]. I think coupling the processor impl to the server is kind of required for such an optimization (since we're essentially making decisions on how to run an RPC given the application-level characteristics of that RPC). Do you have any tangible numbers as to how well it worked, or was that just more "feeling"? Any thoughts on how we could measure the improvement of such a change?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3477
16585	ACCUMULO-3470	Also, shouldn't this also be tagged for 1.6 and 1.7?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3470
16586	ACCUMULO-3470	There are two remaining test classes that don't seem to have anything to do with Accumulo left in the accumulo-start module after this change. They seem to only be testing features of vfs hdfs support. Shouldn't those be moved over to be tests within commons-vfs instead? These two are VfsClassLoaderTest and ReadOnlyHdfsFileProviderTest.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3470
16587	ACCUMULO-3470	So the tests pass with the hadoop 2 profile, but not the hadoop 1 profile. The commons vfs2 HDFS dependency is Hadoop 2.6.0. It appears that the hadoop-1 profile was removed in Accumulo 1.7.0. What's the appropriate action here? Revert the commit in the Accumulo 1.6 branch so that it continues to work? I think the ReadOnlyHdfsFileProviderTest class can be removed in Accumulo 1.7.0 and beyond.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3470
16588	ACCUMULO-3464	Doesn't the resolution of "Done" address your issues of it not showing up in a release notes, [~ctubbsii]?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3464
16589	ACCUMULO-3423	Have all the ITs working now, except those related to replication. I talked to [~elserj] about the changes necessary. * the tablet server or master should inform replication when a WAL is closed * the GC should defer deleting WALs in use by replication * the tablet server should just let the GC clean up WALs	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3423

#	Requirement	Questions	Answered	Successfully Answered	URL
16590	ACCUMULO-3409	The RFC 6335 referenced in the description also defines the other two ranges of ports as: System (canonical; aka Well Known), and User (canonical; aka Registered), both of which are described as assigned by IANA. The "Ephemeral" ports are also termed Dynamic (canonical; aka Private), and their distinguishing trait is that they are not assigned by IANA, which is the case for us. While I don't necessarily see a problem changing the default ports for these services, I'm having a bit of trouble understanding the reasoning, since these ports are not registered with IANA and the designation of this range as "Private" seems to make it at least as appropriate as any other range. Further, that RFC also declares the expectation that assignment requests for numbers in the User Port range must provide an explanation as to why use of the Dynamic ports is not acceptable. Do we have any such justification, and/or is anybody planning on requesting IANA assignment for these services? Additionally, the only restriction, from what I can tell, about using the ports in the Dynamic range, is that the port number cannot be used as a service identifier... which is not an issue for us. We identify services through configuration, or registration in ZooKeeper, not through the numerical value of the port. In short, I think it'd be fine to change the numbers to something in the User range, but only if it is accompanied by a request to the IANA for port assignment, with justification and all. In lieu of that, I think using ports in the Dynamic range for defaults, as we've been doing, are fine.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3409
16591	ACCUMULO-3404	I'm all for reintroducing the class, but could you elaborate on the cause for the public API confusion? Do we point people to that class in our docs or something?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3404
16592	ACCUMULO-3404	Was that class instrumentation or the tracer service? If it's instrumentation, maybe it makes sense to keep deprecated even if it's not part of the public API, but if it's part of the tracer service, it should be safe to leave out. However, I'd rather we stick to our definitions going forward, and the public API does not define trace as part of it.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3404
16593	ACCUMULO-3402	what module were the classes in before? was it core?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3402
16594	ACCUMULO-3402	bq. what module were the classes in before? was it core? Yes.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3402
16595	ACCUMULO-3402	Commenting here instead of on the review, because it's more a design issue than a code issue. Ed's comment on ACCUMULO-1242 [here|https://issues.apache.org/jira/browse/ACCUMULO-1242?focusedCommentId=13812208&page=com.atlassian.jira.plugin.system.issuetabpanels:comment-tabpanel#comment-13812208] becomes relevant again. Initially I solved it by moving the classes out of core, but that apparently caused other issues. ;) Can we file a follow on to address that and improve how we handle logging in the MR classes again? Otherwise, the patch LGTM (although admittedly, I only skimmed it, since much of it looked like classes were just added/deleted/moved).	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3402
16596	ACCUMULO-3402	bq. Can we file a follow on to address that and improve how we handle logging in the MR classes again? Certainly. Thanks for bringing that up -- I had forgotten about it -- and for looking over things.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3402
16597	ACCUMULO-3402	[~elserj] Can you please explain the rational behind your shift in thinking? At one point you said the following, the switched to option 1. Basically can someone please ELI5 what the big win for users is for having a seperate M/R module? Lets call moving everything back to core option 3. bq. FWIW, the easiest resolution I can come up with short-term is a revert of the original changes (move the classes back to core/) and come up with a better solution moving forward. There is possibly an option 4. Break core into two modules core-mr and core-foo (not sure what to call it). Make the current core module depend on the two new modules. I don't really like option 4, but if there is some strong reason to put the MR code in its own module, option 4 may still maintain 1.6 pom compatability from a users perspective. [~elserj] and [~ctubbsii] it seems like you guys are leaning twoards option 1. I don't like this idea of deprecating the entire map reduce API because of historical churn in MR API. This churn occurred in 1.4, 1.5, and 1.6 see ACCUMULO-1533 (removed a lot of deprecated stuff in MR API), ACCUMULO-769, ACCUMULO-267. Of course as I said I don't understand what the win for users is w/ moving stuff into a seperate module, and that lack of knowledge makes me dislike option 1.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3402
16598	ACCUMULO-3394	This is a reasonable reorganization of some server-side utilities related to our RPC services. However, I would strongly prefer a different package name than {{thrift}}, which is a package name we typically use for generated thrift code. Is there a more appropriate package name that will be less likely to be confused with those we use for generated thrift code? If not, that's fine, too. I'll just have to improve my {{grep -v /thrift/}} pattern when I'm spelunking through our code. Maybe {{org.apache.accumulo.server.util.rpc}}?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3394
16599	ACCUMULO-3390	I've looked at the integration tests and I am unable to find where the Monitor is started. If someone can point to the file, I'd appreciate it. No rush. I think I've worked out how to start the Monitor thread but I'd like to compare my approach with the integration tests.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3390
16600	ACCUMULO-3384	"but there may be a use case for system-wide ones also." This caught my eye. Is there a use case for this or is this a boondoggle? The scenario you provided seems to be setting messages through ZK properties. Is this a need or just a nice to have ? Why can't we store this information in the monitor itself? a flat file? Seems like that would be a specific use case that is easy to address.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3384
16601	ACCUMULO-3381	Is trace even necessary to deprecate at all? Is trace part of the public API at all?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3381
16602	ACCUMULO-3375	So, there's a few reasons why I think we should not do this: # This could create a circular dependency (how do we authenticate users so they can interact with the metadata tables? who can scan the user table?) # There's no sense of consistency... and any real-time attempts to be consistent would kill performance: we'd have to scan this table every time we do any other operation: create table now triggers a table scan. # The user database is typically very small, and infrequently updated. The idea of using an Accumulo table to store this seems a bit overkill. Some of this might be a little bit easier with the system user, but this would be an enormous change, and I don't see a lot of value from it. I do see the potential to do it very badly that kills performance or breaks security. If the ZK implementation is not sufficient, we're probably better off improving the pluggable security APIs added in ACCUMULO-259. If anybody is interested in pursuing this, I'd like to review the design.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3375

#	Requirement	Questions	Answered	Successfully Answered	URL
16603	ACCUMULO-3375	Thanks for the thoughts, [~ctubbsii]. bq. This could create a circular dependency (how do we authenticate users so they can interact with the metadata tables? who can scan the user table?) My gut reaction was that the !SYSTEM user would continue to be "special", and perhaps not have an entry in said table. I think that would get around most of the cyclic issues. Other permission issues would still need to be sorted out. bq. There's no sense of consistency... and any real-time attempts to be consistent would kill performance: we'd have to scan this table every time we do any other operation: create table now triggers a table scan. Pretty sure our tables are consistent ;). Turning on the datablock cache for this table (like the metadata table) should alleviate most pain, but metrics would be needed. IsolatedScanners could also be used if we need strong consistency when scanning across a row. bq. The user database is typically very small, and infrequently updated. The idea of using an Accumulo table to store this seems a bit overkill. I think I thought the same thing initially, but how much of that is because of how we have implemented the user system to begin with? Consider a large organization with authentication via an external system like LDAP or Kerberos. Having a scalable store provided by us would be nicer for all those permissions/authorizations/etc. Need some more measurable numbers behind it.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3375
16604	ACCUMULO-3353	I don't know that I'd call this a bug. Maybe an improvement.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3353
16605	ACCUMULO-3338	Why did this commit strip useful comments from the template? Especially since the {{bootstrap_config.sh}} script explicitly looks for some of them, but was not also modified? Minimally, those comments should be re-added, unless there is sufficient reason to justify removing them. Also, under what circumstances are these {{/usr/hdp/current/*}} paths appropriate? I'm not familiar with that specific packaging, and I think there's possible risks for including too broad a classpath (as is, I tend to recommend people modify the example configs, and avoid the kinds of wildcards in the classpaths that we use in the example). (For that matter, I'm not necessarily comfortable with the {{/usr/lib/hadoop*}} ones either, because they seem to map to a very specific 3rd party packaging (and I don't want to get into the business of trying to support all possible 3rd party packaging schemes), but I'm not sure when those were introduced.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3338
16606	ACCUMULO-3338	bq. Why did this commit strip useful comments from the template A "close" comment followed immediately with a new "open" adds no value whatsoever in my opinion. That is why I removed the "close" comments. bq. Especially since the bootstrap_config.sh script explicitly looks for some of them, but was not also modified? I was not aware that comments were of any significance in generating the actual configs. I'm not going to feel bad for missing that, but thank you for bringing it to my attention. bq. they seem to map to a very specific 3rd party packaging Any packaging would be considered "very specific" since it's the only packaging that would be writing to such a location. These locations will ensure that Accumulo, out of the box with the *example* configurations, can run on top of a Hortonworks installation. Unless you can present some case where there are other jars that happen to also match these regexs, there is no risk. Again, these are *example* configurations which really aren't meant for production use. Users shouldn't be using these configs outside of testing and have custom configuration files which have a minimal set of classpath entries for their specific system.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3338
16607	ACCUMULO-3327	Did this ever happen?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3327
16608	ACCUMULO-3327	I meant more, is this something we should cherry-pick back to 1.7? It's not clear what the final change that was committed was.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3327
16609	ACCUMULO-3321	Github user joshelser commented on a diff in the pull request: https://github.com/apache/accumulo/pull/18#discussion_r20067167 --- Diff: core/src/main/java/org/apache/accumulo/core/client/impl/ThriftScanner.java --- @@ -115,12 +115,12 @@ public static boolean getBatchFromServer(Instance instance, Credentials credenti } catch (TApplicationException tae) { throw new AccumuloServerException(server, tae); } catch (TooManyFilesException e) { - log.debug("Tablet (" + extent + ") has too many files " + server + " : " + e); + log.warn("Tablet (" + extent + ") has too many files " + server + " : " + e); } catch (ThriftSecurityException e) { log.warn("Security Violation in scan request to " + server + ": " + e); throw new AccumuloSecurityException(e.user, e.code, e); } catch (TException e) { - log.debug("Error getting transport to " + server + " : " + e); + log.warn("Error getting transport to " + server + " : " + e); --- End diff -- This is tricky. In the case that a tserver fails, this would cause logging on the client. Ideally, the system will recover from a tserver failure and the client wouldn't even have to know that a failure happened. Might it make more sense to leave this at debug for the first N occurrences for a server and then elevate it to warn at the N+1th time?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3321
16610	ACCUMULO-3321	Github user busbey commented on the pull request: https://github.com/apache/accumulo/pull/18#issuecomment-62410572 Can we reuse the log message back off from the balancer warnings about "I can't balance because foo" ?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3321
16611	ACCUMULO-3321	Github user arielvalentin commented on the pull request: https://github.com/apache/accumulo/pull/18#issuecomment-62414640 @busbey I am afraid I am not sure what you are referring to. Would you be able to elaborate a bit for me? @joshelser I empathize with that concern because I don't have an instinct as to how much log output this will generate. Would you feel more comfortable with a more sophisticated pattern, where it logs something like "50 failures have occurred in the past N attempts"? I haven't familiarized myself with the code base enough to know if that is possible.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3321
16612	ACCUMULO-3321	Github user arielvalentin commented on the pull request: https://github.com/apache/accumulo/pull/18#issuecomment-62422047 @busbey Thanks for the hint. @joshelser had mentioned a different ticket [ticket|https://issues.apache.org/jira/browse/ACCUMULO-1268] that tries to address some design changes that the team wants to make to the client that would make it a bit more robust. I feel like the direction you are both preferring to head may fall under the umbrella of the "robust" client, e.g. sophisticated logging thresholds, monitoring, resiliency, etc... Am I reading too much into your comments?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3321
16613	ACCUMULO-3321	Github user keith-turner commented on the pull request: https://github.com/apache/accumulo/pull/18#issuecomment-62422710 What are the pros and cons of putting the following in your log4j config vs this change? org.apache.accumulo.core.client.impl.ThriftScanner=DEBUG	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3321
16614	ACCUMULO-3317	Is this fix only on master so far? Edit: Never mind, I forgot that the branching scheme had changed.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3317
16615	ACCUMULO-3300	Can you see any problem with putting it in 1.6 as well?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3300
16616	ACCUMULO-3300	Instead of swapping out one hard coded value for another, can we expose this as a configuration to users?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3300
16617	ACCUMULO-3300	[~mdrob] Are you concerned that some people will not like this change? I would shy away from adding extra parameters for this due to the already high complexity of our configuration. I think the future of this feature ought to be migration to some sort of standard instead, like opentsdb. Can you think of a way to do this that reduces the complexity of core Accumulo?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3300

#	Requirement	Questions	Answered	Successfully Answered	URL
16618	ACCUMULO-3294	Thanks for the patch, [~parkjsung]. Some comments.. * Javadoc on the {{updateIterator}} method benefit from explicitly stating that this method is only intended for use when the iterator is already configured at the given scope. Otherwise, this javadoc is very nice. * {{TableIteratorConfigHelper.java}} needs some Javadoc. Class level (why does it exists? what's its purpose) and methods (what does the method do, what are the arguments required). * Does {{TableIteratorConfigHelper#transformOptions}} need to use a TreeMap? Is keeping these properties in sorted order important? If not, a HashMap would be better. Also relevant for {{TableOperationsHelper.java}}. * Would be nice to make sure the arguments to the constructor for {{TableIteratorConfigHelper}} are non-null. {{java.util.Objects#requireNonNull(Object)}} is nice for this. * Some basic comments on what each test is verifying in MockTableOperationsTest.java would be nice. * An integration test would also be appreciated that verifies this API in practice. e.g. set an iterator on a table, verify some query result, use this new API to change some configuration on the iterator and observe that the query results changed.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3294
16619	ACCUMULO-3294	The proposed change only updates a single iterator. A new API call that allows updating all of a tables iterators at once would be nice. Since [~ctubbsii] is working on atomic config changes, this new API could be made to atomically update all of a tables iterator settings at once. Looking at the current patch, it verifies an iterator with the given name is currently set on the specified scopes. What I am proposing would not do this. Why do you need this check?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3294
16620	ACCUMULO-3294	No substantial reason. My original reason was that since the method was called "update", I added a check so that it couldn't be used like a "set". It adds a little bit protection from surprises for clients since if I as a client (and perhaps its just me) am trying to "update" an iterator setting, I'm assuming that the iterator is there. If it suddenly disappears while I'm trying to update, then perhaps something happened that means I shouldn't update. It's not a spectacular solution to provide this protection since it's performing a read/modify/write with no locks so the iterator could still disappear. I don't feel too strongly about the check since there are use-cases for it not being there so if removing the check and making this behave more like a "set" is better aligned with other efforts, I can remove it. What would the new interface look like if we want this to update all of a tables iterators at once? A Collection<IteratorSettingScopePair>?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3294
16621	ACCUMULO-3294	bq. What would the new interface look like if we want this to update all of a tables iterators at once? A Collection<IteratorSettingScopePair>? Yeah something like that. Ilike the name {{ScopedIteratorSetting}}. So pass in a {{Collection<ScopedIteratorSetting>}}. {{ScopedIteratorSetting}} could extend or contain {{IteratorSetting}} and have scope info.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3294
16622	ACCUMULO-3284	Am I missing context from some off-list discussion on this ticket?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3284
16623	ACCUMULO-3284	I'm sorry, I don't understand. What's the basis for the -1? Or am I misinterpreting the closure? Why not just unassign yourself?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3284
16624	ACCUMULO-3268	Would it make sense to configure a BatchWriter with a {{RetryPolicy}}? Or did you envision some other solution?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3268
16625	ACCUMULO-3263	Can this be thought of more generally as a way to forcibly go from relative paths to absolute paths too?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3263
16626	ACCUMULO-3246	Let's not attribute too much wisdom to my comments here. Experiments should be done, and metrics exposed. But, the IMM / #activeTablets should be chunky. How chunky? I'm going with an HDFS block size. If HDFS block size is 100K, and there are ~10 tablets/server, let's go with 1M... maybe more since the data is compressed on the way out. What's the compression rate for your flush files? 10-1? 5-1? That would be good to know.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3246
16627	ACCUMULO-3236	How is this different from ACCUMULO-571? The whole idea seems antithetical to the idea of "clone", since the result will not be a clone of the original in any sense of the word "clone".	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3236
16628	ACCUMULO-3236	Right, we've identified two options to get what you want (union + delete + rename OR clone-ish/merge thing described here) and two options to get what I'd want (union OR clone + clone-ish/merge thing). For the irreversible merge you describe, it's one step your way, and a few primitive steps in my suggestion. For the reversible merge I describe, it's one step my way, or a few steps with what you describe. Both would be implemented using the optimized copy metadata file references, like clone does (plus your suggestion to insert extra split points to avoid chop). I'm not arguing against any of the requirements you've described, or the proposed internal implementation using the same clone mechanisms. The question I'm asking is: which makes the most sense as the API primitives? Personally, I'd go with the well-defined semantics of union and delete. I'm also pointing out that, from a user-facing perspective, this is not an improvement over a clone function... it's a brand new feature, with very different behavior from the clone operation.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3236
16629	ACCUMULO-3236	how about snapshot-import so that it lines up with bulk-import? also it gives a clear delineation on what gets included from Table B in Table A.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3236
16630	ACCUMULO-3236	I agree it's definitely more similar (semantically, not implementation-wise) to bulk import. The bulk import command is importDirectory(). Perhaps importFromTable(). Snapshot sort of implies that the table is consistent at a point in time, and I don't think we can guarantee that unless the source table is offline'd first. Is that going to be a prerequisite for this?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3236
16631	ACCUMULO-3236	Has this discussion moved from "how should we do this" to "what should we call it?" AFAICT we all agree on: 1) snapshotting a table's metadata 2) merging in snapshot from 1 into another table's current state My use of "snapshot" isn't a preference-- historically I've always heard "clone" as being "just a snapshot." I do think "clone" is a composition of the snapshot'ing functionality, table creation, import, but I'm not inclined to make snapshotting a public facing API call for users.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3236
16632	ACCUMULO-3236	bq. Has this discussion moved from "how should we do this" to "what should we call it?" I think so. bq. I do think "clone" is a composition of the snapshot'ing functionality, table creation, import, ... I think "snapshot" implies some explicit view at a point in time of a table. Because of the way clone is implemented, I would probably describe the relationship between "clone" and "snapshot" somewhat the other way around. Clone is not so much a composition of a snapshot functionality. Rather, snapshotting can be achieved using clone, along with ensuring the table is offline (or at least, ingest is halted and the table is completely flushed). Clone by itself, can result in some very unexpected behavior if you assume it represents a snapshot in time of a table. For instance, a clone can pick up new data that was bulk imported to a tablet, but not older data that is waiting to be flushed... so even within a tablet, you can get gaps in time from clone, never mind the expectations for a snapshot view for an entire table.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3236
16633	ACCUMULO-3236	If we break wire compat, I'm -1 on inclusion in 1.6. I'd *really* like to maintain wire compat for 1.7, but am -0 if it is broken.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3236
16634	ACCUMULO-3236	What's the status here, [~vines]? Is this viable for 1.7.0?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3236
16635	ACCUMULO-3224	are we concerned about the fall back case where System.nanosTime passes through System.currentTimeMillis in a different set of units?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3224

#	Requirement	Questions	Answered	Successfully Answered	URL
16636	ACCUMULO-3224	[~busbey], do you mean on old kernels that don't have CLOCK_MONOTONIC support? No, I'm not concerned about that case. CLOCK_MONOTONIC is POSIX and (from what I understand) has been in the kernel since well before the 2.6.32 kernel in CentOS 6. And, in any case, that fallback on those very old kernels is no worse than what was there before this was patched. Do you have concerns about this case?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3224
16637	ACCUMULO-3210	Could we adapt [~bhavanki]'s work to isolate the random walk code for this? Maybe move it into a contrib?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3210
16638	ACCUMULO-3206	Copying from user list: It should suffice to list the number of entries for a table, tablet and tablet server. No need to worry about number of unique rows, number of unique column families, etc. By entry I mean number of (key,value)s. For load balancing, we care about how much physical data is on each tablet / tablet server. This is directly proportional to the number of entries, assuming that the key size and value size in bytes do not differ too drastically. If they do (say for raw documents of vastly different sizes), the **best measure is the size of the data in bytes** for each tablet / tablet server. I didn't suggest it because it doesn't look like Accumulo tracks it so it would involve a lot of new implementation and book-keeping, which could hamper performance. Accumulo does already track the number of entries for tables, tablets and tablet server. It's just hard to get to, relying on the format of the metadata table and accessing the non-public Monitor classes. Bringing it to the public API just looks like a matter of reworking the API and letting the client gather the information that the Monitor already does by connecting to each tablet server. Does that sound reasonable?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3206
16639	ACCUMULO-3206	Would it suffice to add his in the current major development line, or would you need it in 1.6?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3206
16640	ACCUMULO-3206	What kinds of use cases can this solve that the REST version of monitor stats in ACCUMULO-3005 doesn't? If we're still pushing to get that in (and I hope we are), couldn't we just add the missing bits (# bytes) to the info returned by that web service?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3206
16641	ACCUMULO-3204	[~ctubbsii], is there more to be done here? Can you update with the current state, please?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3204
16642	ACCUMULO-3197	As part of the removal of the confusing Accumulo configuration story, can you please make a point to be clear at the javadoc level about what API methods do exist and how they should be used? Given that I'm always confused about what methods I can actually use (albeit some of my confusion is related to the server-side AccumuloConfiguration methods), I imagine users are equally or more confused :)	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3197
16643	ACCUMULO-3178	It was brought up in ACCUMULO-3181 that the VolumeChooser isn't strictly public API, even though it is selectable in the system-wide configuration properties, which is considered public API. I think it's the intention that the VolumeChooser (and other server-side pluggable components) should be in the public API, but the fact remains it is not currently. Currently, the examples use stuff not in the public API, but the goal of ACCUMULO-1641 is that the examples only use the public API at some point. I don't know what the implications for this are for this issue. Should the VolumeChooser be declared public API first? Given that it's pluggable, it may already be expected to be public API.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3178
16644	ACCUMULO-3178	bq. So, you typically have to run distcp first before you can bulk import. If you list both A and B in instance.volumes, but have a volume chooser only choose A. Now, you can bulk import files currently on B, but they'll get stored on A when they are compacted, eliminating the need to distcp. Couldn't the files you imported get deleted by A before B MajCs them? You would have to clone or offline the source table on A, no?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3178
16645	ACCUMULO-3178	What would delete them?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3178
16646	ACCUMULO-3177	bq. it allows any user with ALTER TABLE to change how the system manages hdfs internals This is already true for a great many HDFS parameters, such as replication, block size, durability, etc. The chooser is further removed from those things, since it at least keeps things at the Accumulo layer of abstraction rather than HDFS internals, because the focus of this issue is to specify a class to do the volume choosing for a particular table. It has little to do with HDFS... only Accumulo volumes. bq. namespaces property altering can be limited to a much smaller set of trusted individuals Table-level properties always override namespace-level properties, and it is presumed that more people will have permissions to alter a table's properties than will have namespace-level permissions, which it seems you are acknowledging by mentioning that it's common to have ALTER TABLE, so I'm not sure what you're suggesting here. Unless... are you suggesting that we create namespace-only properties, which cannot be set/overridden at the per-table level? Because that would be a *huge* change to re-work all the configuration internals. In any case, I think there's merit to having a first pass not require ACCUMULO-3176, by setting the parameter at the namespace level rather than at table creation. I don't think there's any reason to explicitly prevent a per-table property being set for this, though.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3177
16647	ACCUMULO-3177	[~hustjl22]: Can you rebase this patch onto the latest master? In particular, I think some of the calls to the choose method violate the goal of ACCUMULO-3181 and should be updated (some of the use of {{ServerConstants.get*()}} convenience methods seem to be forcing the chooser to choose paths, not volumes again). Additionally, I think some more problematic conflicts were introduced in {{Initialize.java}} since the last time the patch was updated, a few more {{choose}} methods exist, some substituting {{"/"}} with {{Path.SEPARATOR}}, and maybe a few more changes. Thanks for the work on this! Your contributions are appreciated.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3177
16648	ACCUMULO-3176	{quote} bq. Why not instead add the ability to wait for a set of properties to have been seen by all tservers? Because that really sucks for large numbers of tservers. Your single client now needs to communicate to every single server in the instance and ask them to confirm that they've seen a given property. The more realistic way to do it would be to introduce a new RPC call that forces all tservers to drop their ZooCache entries. However, the end result is that you still have to add new API calls to support this. {quote} Couldn't the RPC for setting configuration on a table tell all the tservers to drop cached entries related to said configuration change? that avoids adding new client RPC and solves the general race condition on table properties.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3176
16649	ACCUMULO-3176	bq. Couldn't the RPC for setting configuration on a table tell all the tservers to drop cached entries related to said configuration change Can you be more specific on how you see that working? I can't think of a simple way that wouldn't still be a broadcast to all servers. We could probably hide something inside the implementation for setProperty on {{TableOperationsImpl}} but someone will still have to reach out and talk to each tabletserver (whether client, master, or a tserver). A FATE operation could probably be used to wait for it to happen, but the master would just be doing the RPC then. The other option would be using ZooKeeper to broadcast that, but we've just looped onto the same problem we were trying to solve at that point :). We could potentially have the master delegate to other tservers to tell other tservers to drop their ZooCache for this table (akin to how bulk-loading delegation works) but that's rather complex and scary. Trying to make sure that all possible servers see an update seems more complex to me than just allowing properties to be provided at table creation time before the servers even know about that table.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3176

#	Requirement	Questions	Answered	Successfully Answered	URL
16650	ACCUMULO-3176	bq. Unless we disallow non-creation-time table properties, creation time properties still aren't a real solution. Do you mean that the update of a table property at some point in time (after it exists) is subject to the same race condition? That's definitely true. I'd speculate that the issue is possibly less heinous for iterators/combiners/constraints because it's likely that you only set at table creation but that's subjective. bq. we force a refresh of properties related to a table when it transitions from offline to online? It's not clear to me how this would work either. You could probably invalidate the table properties when a tablet is loaded on a tserver, which would encompass the offline->online transition. I think that could work. I don't like the story of "just offline and re-online your table to make sure configuration propagates". That's really nasty. Are we at least in agreement that allowing properties at table creation do mitigate the potential race condition? We would definitely need something more heavy-handed to properly fix this (or we'd have to do away with ZooCache...) that is probably out of scope for this issue specifically.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3176
16651	ACCUMULO-3176	{quote} Are we at least in agreement that allowing properties at table creation do mitigate the potential race condition? We would definitely need something more heavy-handed to properly fix this (or we'd have to do away with ZooCache...) that is probably out of scope for this issue specifically. {quote} No, because it only solves one race condition. It leaves people prone to needing to redo a table entirely because they didn't realize they had to set the property at creation time. Or worse, it leaves them unaware that they are in this state. {quote} It's not clear to me how this would work either. You could probably invalidate the table properties when a tablet is loaded on a tserver, which would encompass the offline->online transition. I think that could work. I don't like the story of "just offline and re-online your table to make sure configuration propagates". That's really nasty. {quote} It's not nasty if you can only set properties when it's offline. That would mean the story is "In order to ensure a consistent view of per-table configuration properties you can only alter them when the table is offline. When the table is brought online each tablet server will properly reflect the updated property." If I forgot to set something at creation time, I can follow a procedure to ensure I have a consistent set of properties. That might get more complicated if I need better assurances (like doing an offline MR job to verify the extant data is consistent with some constraint I want to add), but atleast there's a usable path that isn't "you have to create a new table and set the properties then."	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3176
16652	ACCUMULO-3147	bq. You just want to be able to specify to use a different (user-created) table Yeah, I wanted to focus less on the specifics of where the table came from and just make it dynamic. I don't want this to be an issue if we make a replication namespace and suddenly decide we want the replication table over the instead of the accumulo namespace (for example). bq. some other config, but ZK makes sense Yeah, the normal site+ZK configuration is what I meant. bq. I'd have preferred all the replication stuff sit outside Accumulo, as an add-on, and just provide the internal hooks necessary for that external system to operate. I will leave you to that to expose all of those scary internals out the clients :). I'm not convinced you can actually do this and properly track the replication status; however, you are more the free to investigate it yourself. bq. the problematic logic in the master and in the tests that arbitrarily create/delete/scan/alter permissions on the replication table How is it arbitrarily doing anything? There are a number of things that are always checked on the replication table and configured if not present. This doesn't change with what I suggested. The name of the table being used is simple not hard-coded. The assumptions on how that table must be configured are still the same regardless of the name. Yes, while some of the permissions granted are not entirely necessary, giving the root user permission to read/write/alter the table is 100% normal and expected. It would be nice if it's done up front (I'm assuming this is something you've done), but it doesn't mean we can't check it later to make sure that is still the case.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3147
16653	ACCUMULO-3147	bq. Yeah, I wanted to focus less on the specifics of where the table came from and just make it dynamic. I don't want this to be an issue if we make a replication namespace and suddenly decide we want the replication table over the instead of the accumulo namespace (for example). Describing it this way seems like an argument for making it external to Accumulo, as an add-on, not as. In my view, it's either a system-managed table or it's a utility table declared by some external, client system. As is, it seems like a hybrid. bq. I will leave you to that to expose all of those scary internals out the clients . I'm not convinced you can actually do this and properly track the replication status; however, you are more the free to investigate it yourself. I have no interest in even attempting to do that. My point was that this seems like it would have been a preferable implementation, because as is, replication seems to be a hybird user-system/baked-in system, and bloats Accumulo's internals. I'm not objecting to the point where I think we should revert (not seriously considering that anyway), but I do think it needs a lot more polishing before it can be released. bq. How is it arbitrarily doing anything? There are a number of things that are always checked.... The very idea of dynamic checking of the table's existence, and proper configuration, reveals the fact that the table is expected to be a user-managed table, not a system-managed one. This is the problem I have with the current implementation. It's treated as a user-managed table, but created at runtime as needed by the master, utilized by the system user for internal system features. It's tested as a user-table, also, being created by the root user in most tests, and deleted as needed for testing. Very little about how it's utilized reveals itself to be part of an internal system table. System tables are always present, have well-defined access permissions, exist in a non-conflicting system-managed namespace, have well-known table IDs, and have strict tests to ensure they behave this way. User tables can be created on the fly, exist anywhere except the system namespace, can be deleted by users, and have permissions that are appropriate to the external user/system that utilizes them. The trace table is a slight exception, because it existed before namespaces and somewhat blurs the boundaries, but even it is primarily treated as a user-controlled table by an external service, since the external tracer service creates the table, and uses credentials to do so, from a stored configuration file. But, the replication table is not created by an external service. It's created by the master, as needed, can conflict with user table names/config, which can block replication from working, does not have a fixed tableID, and is part of an internal feature. Don't get me wrong... I don't think this is unfixable (indeed, I'm trying to fix some of it). I think it just needs some more polishing before release. But, it's what I meant by "arbitrarily".	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3147
16654	ACCUMULO-3137	Work was logged on this issue. Is it complete?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3137
16655	ACCUMULO-3134	Since we can't predict what options everybody's custom compaction strategies will need, does it make sense to just accept a map for configuration?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3134
16656	ACCUMULO-3134	bq. Since we can't predict what options everybody's custom compaction strategies will need, does it make sense to just accept a map for configuration? My thinking was that these options would leverage a specific compaction strategy built into accumulo. If the compact command had an option for specifying a general compaction strategy w/ option map, then that could be mutually exclusive w/ these options. I think this approach will be less cumbersome to use, while still allowing generalization thats more cumbersome.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3134

#	Requirement	Questions	Answered	Successfully Answered	URL
16657	ACCUMULO-3124	This shouldn't be assigned to me. I didn't make this issue, nor do I consider it a blocker. It's probably a useful thing to do, but I don't have the time to do it.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3124
16658	ACCUMULO-3115	Is this happening frequently? It's not a great test: trying to verify the durability model by performance. The test should be printing out the performance values: what are you seeing?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3115
16659	ACCUMULO-3110	The class level timeout set on these looks a lot tighter than the sum of the individual tests that were in them. Do these still pass when not disabled via timeout.factor?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3110
16660	ACCUMULO-3110	No, no it looks like you're correct and the [Timeout Rule is applied per-method|http://junit-team.github.io/junit/javadoc/4.11/org/junit/rules/Timeout.html]. I'm not sure why reading through things made me mis-remember it as applying a limit for all tests in the class. Is the javadoc on testsShouldTimeout clear enough on this or should I file a ticket to improve it?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3110
16661	ACCUMULO-3107	Where (all) are you proposing these changes be made? TableOperations, NamespaceOperations... anything else? Totally agree with you. I can't see any argument to returning an Iterable here. We already have a Map instantiated from the Thrift RPC. We should just pass that along.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3107
16662	ACCUMULO-3091	What are the use-cases that we need to hide user configurations from other users? Given that most things are already available to read in ZooKeeper, I want to make sure that there's well-defined reasons to try to implement this because the changes would be very widespread across the entire codebase.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3091
16663	ACCUMULO-3090	If a tablets dir is no longer in instance.volumes, then it should switch to a new volume. See {{VolumeUtil.decommisionedTabletDir()}}. Is this not working?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3090
16664	ACCUMULO-3090	One backup option starting w/ 1.5 is exporting tables. Can clone, offline, export.. leaving original table online while distcp copies exported files. Would need to write a little script to do all tables in an instance.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3090
16665	ACCUMULO-3090	bq. Are you referring to the replication feature, or something else? Yes, disaster recovery was the primary use case that drove replication and was created specifically to avoid the steps which you outlined.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3090
16666	ACCUMULO-3090	{quote} So, when Sean asked how a tablet spread across volumes would affect disaster recovery, I took it to mean backup and recovery. {quote} Correct, I meant recovering a given crashed cluster. Replication is needed for a real disaster recovery plan, but there will be plenty of folks who need to fix broken systems without having a hot-swappable backup. Even those with one would probably prefer to avoid copying as much as possible, esp those who have large enough clusters to warrant the complications of multiple volumes. For example, how does [recovering from a lost ZK quorum|http://accumulo.apache.org/1.6/accumulo_user_manual.html#zookeeper_failure] get impacted if the files for a given tablet are spread across volumes?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3090
16667	ACCUMULO-3089	I read through some of the first ticket. I will have to read through it all later. It sounds as if HSM gives you the ability to ask for a file on a particular medium or with some other characteristic (local or remote). Does this feature work within one namespace, or across namespaces?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3089

16675	ACCUMULO-3089	Jenna, thanks for getting involved in Accumulo! With the feedback on the current patch it looks like you're on your way to having a well formed implementation. Before too much more work goes into incorporating that feedback, can someone help me understand how the current implementation is addressing the concerns raised in my veto? This still looks like a lot of added complexity for marginal benefit, especially compared to a simpler approach like limiting particular namespaces to particular volumes.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3089
16676	ACCUMULO-3089	[~busbey] wrote: {quote} Before too much more work goes into incorporating that feedback, can someone help me understand how the current implementation is addressing the concerns raised in my veto? This still looks like a lot of added complexity for marginal benefit, especially compared to a simpler approach like limiting particular namespaces to particular volumes. {quote} I replied to your concerns above. In particular, I explained that your "simpler approach" is practically identical to what is proposed. This is an implementation of precisely that sort of thing. You never replied with any disagreement, or explanation of how you thought they were different. Also, just a small point of order here: you can veto a commit, but you can't veto an idea or a contribution. As it stands, I see your "-1" as blocking this patch from being committed, but not the refinement, discussion, and review, of this contribution to the community. As long as your veto stands, it can't be commited to Accumulo, so maybe Jenna will have to host it somewhere else, but my hope is that you'll change your veto once you take a look at the change and realize it achieves precisely the sort of thing that you prefer "like limiting particular namespaces to particular volumes", especially since I believe your veto was based on a misunderstanding of this being scoped around heterogeneous storage.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3089
16677	ACCUMULO-3089	Github user ctubbsii commented on a diff in the pull request: https://github.com/apache/accumulo/pull/16#discussion_r18100611 --- Diff: server/base/src/main/java/org/apache/accumulo/server/fs/VolumeChooser.java --- @@ -18,5 +18,7 @@ public interface VolumeChooser { + String choose(VolumeChooserEnvironment env, String[] options); --- End diff -- Right, this will break the interface. This is low risk, I think, though. The VolumeChooser isn't part of the public API (yet), is it? The alternative is that we can pass the environment with dependency injection to an annotated field, if it exists. If this is something that's a blocker, that's an option. There's also a slight behavioral change to consider here (improvement, I think) that may be relevant, if we're concerned about API. The original VolumeChooser interface did not choose between volumes.... it chose between paths. This patch changes things so that the API conforms to the user expectations that it will be provided with volumes from which to choose, which the framework will append any necessary paths to, if needed.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3089
16678	ACCUMULO-3089	[~busbey] My question above was never answered. I'll paste it below so you don't have to search for it: bq. It sounds as if HSM gives you the ability to ask for a file on a particular medium or with some other characteristic (local or remote). Does this feature work within one namespace, or across namespaces? Personally, I don't understand how HSM is equivalent to Volume selection. It appears based on what I read that HSM would allow you to create a file either in memory, disk, or some other medium. Volumes are a mapping to an HDFS namespace. Does HSM allow you to specify that you want a file created in a particular namespace?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3089
16679	ACCUMULO-3089	Github user keith-turner commented on a diff in the pull request: https://github.com/apache/accumulo/pull/16#discussion_r18106232 --- Diff: server/base/src/main/java/org/apache/accumulo/server/fs/VolumeChooser.java --- @@ -18,5 +18,7 @@ public interface VolumeChooser { + String choose(VolumeChooserEnvironment env, String[] options); --- End diff -- The user facing property general.volume.chooser allows user to set classes that implement the existing interface. That seems to put it in the public API? One option is to deprecate that property and introduce a new property that uses a new interface (don't base new interface on current one). If the old prop is set, could still use the old class/interface. If both are set, then error.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3089
16680	ACCUMULO-3089	[~busbey] wrote: bq. Just as a simple example, limiting volumes to particular namespaces would not require changing when table properties are available. It would also not require changing the table creation api. Oh, I see. Yes, absolutely, that would be a simpler example. Certainly, that could be done, but I don't see how useful it would be. Without any environment, the only choosers possible are ones that have hard-coded decisions, which would have to be recompiled when the policy changes, or who rely on external/remote services for configuration. (This is true of the namespace example, for instance... because there is no way for the chooser to know which namespace it is making a decision for.) None of our other pluggable components have such limitations, and we've made it possible to configure each through environment (usually table properties, as in the case of iterators, constraints, etc.), so I don't see why this addition should be vetoed here. So, yes, that's a simpler example... but it's not an example which satisfies the criteria of this ticket, because this ticket is essentially about creating an example which can make smarter decisions, based on configuration. Is "there could be another implementation/example" your only remaining basis for your veto, or is there something inherently wrong with the idea of giving environment/configuration to the chooser? Also, how do you feel about the sub-tasks, the per-table volume chooser (similar to the per-table balancer), or the example preferred volume chooser? Does breaking it up like that help frame, change, or address your concerns in any way? To which of those two would your veto apply, or would it be for both? bq. For the record, my veto is not based on a misunderstanding. That seems to express a degree of confidence in one's understanding the other side of the conversation that I do not believe anybody could ever have. There is *always* a risk you've misunderstood somebody else's intentions (in this case, my intentions for this ticket I created). I understand this statement to mean that you do not believe you've misunderstood the intentions.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3089
16681	ACCUMULO-3089	bq. It doesn't seem that any progress is being made on resolving Sean's veto on this ticket. I suggest some other means of communication where back-and-forth is easier. Looking at the bylaws[1], this isn't a veto, it's an objection. The ASF community concensus building guide[2] appear to back this up. However, our bylaws state that a vote must take place since an objection has been raised. I'd like to prevent that by trying to understand the details behind the proposed alternative. If we can't get our questions answered here, how will changing the communication mechanism help? [1] http://accumulo.apache.org/bylaws.html#CTR [2] https://community.apache.org/committers/consensusBuilding.html	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3089

#	Requirement	Questions	Answered	Successfully Answered	URL
16682	ACCUMULO-3087	Have you tested this on OS X? I know hostname has different options in BSD/Mac.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3087
16683	ACCUMULO-3079	Nifty, did you use the code from ACCUMULO-3067 to see the performance improvements? Anything else that can be replicated?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3079
16684	ACCUMULO-3079	bq. I moved the synchronization to the filter, so the functionality is still there Right, I was just noting that you came to the same conclusion about being able to move it. bq. I did play around with removing the SyncronizedIterator altogether in the case where no client iterators are present Hrmm. I wonder how that works for compaction time iterators? Mostly a rhetorical question since you didn't include that change here. bq. I could subjectively say that the performance difference between not having the Synchronized iterator at all and moving its functionality into the VisibilityFilter was small enough to be hidden in the testing noise, but I don't have evidence to objectively state that. Ok, I didn't necessarily expect you to have specifics for that either. I brought it up mostly because I was curious. While having the synchronized "barrier" in the iterator stack does make isolate user iterators from mucking up the system iterators, I think I was really wondering if it even makes sense to "encourage" users to write multi-threaded iterators. I know I personally haven't come across any use cases where multiple threads are used effectively by an iterator. Would it make sense to remove the synchronized iterator(filter) from the default "pipeline" and wire up something through the client API and/or table configuration that can let users enable it. Not implying that this should be done for this ticket, it's just a parallel thought that has some relevancy here.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3079
16685	ACCUMULO-3079	Good question on the compaction scope changes. Since IteratorUtil is used in all scopes, the attached patch does remove the synchronization from the compaction scope. We don't generally do visibility filtering in the compaction scope, so I don't suppose the security vulnerability applies. Do you see any reason why we would need synchronization on the compaction scope? bq. I was really wondering if it even makes sense to "encourage" users to write multi-threaded iterators. I don't believe I have ever come across a use case in which multiple threads are needed (or useful) within an iterator either. From a security perspective, another approach to solving this problem would be to use the java SecurityManager to prevent iterators from using multiple threads.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3079
16686	ACCUMULO-3079	bq. Do you see any reason why we would need synchronization on the compaction scope? It's possible that a user configured their own crazy com.multi.threaded.MyIterator at compaction time which *could* need synchronization, but that's also a reach given that the use-case for multi-threading is a stretch anyways. bq. another approach to solving this problem would be to use the java SecurityManager to prevent iterators from using multiple threads. That's certainly stronger than my first thought of documenting somewhere "don't start threads in an iterator" :). Hopefully if a user tried to do this on their own, they'd realize that they might be doing something weird when they don't have the hooks to ensure 100% that any threads started also terminate.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3079
16687	ACCUMULO-3057	How does the shell do this for the ConfigCommand?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3057
16688	ACCUMULO-3045	I noticed you had a few methods in the commit that overrode the super class, but simply called super.method() (in particular, write() and readFields()). Is there some reason these don't just inherit from the parent class? Also, I'm a bit confused on the intent. Is the token intended to resolve on the client side to a PasswordToken? Or is it intended to resolve on the server-side after the CredentialToken is reconstructed from the RPC? (I only briefly glanced at the diff so far, but hoping to get some information on intent, before further evaluation). My current understanding is that this does the latter (resolving the actual credentials on the server-side). If that is the case, it seems like there may be a gap for a "PasswordResolver.getPasswordToken(CredentialProvider cp);" for client-side resolution (for instance, in the case of reading a password from the local filesystem or environment).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3045
16689	ACCUMULO-3045	bq. I noticed you had a few methods in the commit that overrode the super class, but simply called super.method() (in particular, write() and readFields()). Is there some reason these don't just inherit from the parent class? Ah, some cruft I could've cleaned up. I had thought I needed some extra members and, thus, had to add to the serialization, but ended up not needing to. I'll clean those up. bq. I'm a bit confused on the intent Ultimately the intent is to be able to use a CredentialProvider to authenticate against Accumulo. I'm not entirely positive what you mean about client side or server side, but I *think* the intent is server-side. The desired intent is to be able to seamlessly authenticate with Accumulo using a CredentialProvider (using the shell, a mapreduce job, really anything using a Connector). In practice, it comes off as very similar to what exists for presently for providing passwords to the shell from a file or an environment variable. Does that help?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3045
16690	ACCUMULO-3045	Ahh, yes, I understand you now. If it's not backed by some distributed "means", it's limited by the local resource. Yes, I agree with you 100%. It'll be interesting to see the types of implementations that come about (I'm not entirely sure what's in the works yet, myself) but, given that this is trying to be addressed at the "platform" (hadoop) level, I'm sure that we'll see some good implementations. I definitely liked the fact that I had to alter absolutely no security implementation code and could solely implement this by the creation of a new AuthenticationToken. I made a writeup in the user manual for ACCUMULO-2464; I could do the same for these changes (maybe add in a new subsection in the "Writing Clients" section, or similar). Are you looking for user info, developer info, both? Thoughts?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3045
16691	ACCUMULO-3042	I think we currently provide this functionality for things that call the hadoop command via bin/tool.sh. Presuming we add in this utility class and document how to use it, would we be able to remove that script?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3042
16692	ACCUMULO-3023	If we are going to do this automatically as a part of the 1.7.0 upgrade (read as the first time a 1.7.0 master is started on an instance?), what kind of fail-safes do we need? What happens if the user provides a bad value for the proposed configuration value from ACCUMULO-3537? Should we provide some tool that allows dry-runs? Make sure that the resulting fully-qualified path exists before writing it back to the metadata table?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3023
16693	ACCUMULO-3022	What exactly is the reasoning for this proposal? What problem is being avoided by limiting the length of table names?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3022
16694	ACCUMULO-3022	bq. What problem is being avoided by limiting the length of table names? Memory exhaustion of zookeeper servers. Maybe the issue should be more general. What other points in the Accumulo API can the user put arbitrary data into zookeeper?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3022
16695	ACCUMULO-3022	do namespace names go into zookeeper?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3022
16696	ACCUMULO-3022	How many, let's say, 200 character table names does it take to exhaust the Zookeeper memory and why would that be an Accumulo issue? Plucking a number out of the air, we could say that 2,500 table names of 200 characters each exhaust Zookeeper memory. If we arbitrarily limit table names to 100 characters then Zookeeper memory would be exhausted after 5,000 tables were created? It seems like table name size should be a guideline not an enforceable constraint. You have to know that six months after the constraint is added, someone will have a use case for longer table names and then we'll need to make the constraint configurable. Oh.. and does this need to have 'Major' priority?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3022
16697	ACCUMULO-3022	bq. do namespace names go into zookeeper? Yes, in the same way that table names do.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3022

#	Requirement	Questions	Answered	Successfully Answered	URL
16698	ACCUMULO-3021	What do you mean by 'very large split row'? I can think of several different definitions for this phrase.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3021
16699	ACCUMULO-3020	This issue has been marked "In Progress" for 9 months. What's the status?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3020
16700	ACCUMULO-3019	+1 on undeprecating {{ServerConfiguration}}. Sorry about the warnings. IMO a "ServerConfiguration" object should be some sort of configuration object, so I'm not in favor of having the factory implement it. I'm happy to work with you on figuring out some solution for the plugins. {{ServerConfiguration}} isn't part of the public API, though, is it? To what extent can we practically adjust it? I'm working on the static {{SiteConfiguration}} calls under ACCUMULO-2603. A complicating factor is that {{SiteConfiguration}} sort of belongs in o.a.a.server.conf and not the core, as [~ctubbsii] explained in ACCUMULO-2992, but I'm not planning to address that in the near term.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-3019
16701	ACCUMULO-3005	Is this at odds with ACCUMULO-1013?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3005
16702	ACCUMULO-3005	bq. Is this at odds with ACCUMULO-1013? I'm not really sure what a URL builder is, but I would imagine that this issue would subsume that issue.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3005
16703	ACCUMULO-3005	bq. are there specific advantages you've encountered that make the switch compelling? In using JaxRS resources over Servlets, there is definitely much more literature on configuring Grizzly with said resources, which is primarily how my decision was made so far. I haven't actually been able to find a technical difference (or even a comparison) between the two as to why you'd choose Jetty over Grizzly or vice versa (oddly..). I also haven't found any docs on how to configure Jetty to do the jaxrs stuff (as opposed to servlets) either. I did find that Grizzly publishes a WADL automagically which was pretty cool for me to at least validate that my resources were being loaded. I could see some benefit from that for consumers as well, but that's by no means a strong differentiation.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3005
16704	ACCUMULO-3005	You're not using Jackson directly, are you? I'd imagine you're just using it as the registered provider for {{@Produces("application/json")}}?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-3005
16705	ACCUMULO-3000	Github user joshelser commented on the pull request: https://github.com/apache/accumulo/pull/29#issuecomment-94579191 Overall, this looks nice. Thanks! Could you possibly add an integration test that verifies that you can use the new methods to start up a MiniAccumuloCluster instance? You could lift what MiniAccumuloClusterImpl already does to start ZooKeeper and then just do something simple like read from the Accumulo metadata table as a "can I actually connect to and interact with Accumulo".	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3000

16715	ACCUMULO-3000	Github user ctubbsii commented on the pull request: https://github.com/apache/accumulo/pull/29#issuecomment-102496224 @joshelser You mean with regard to the public API? I don't see any semver violations there. It doesn't even appear to change any public API at all. It just adds an additional (optional) configuration item. Even if that were considered public API, it's an addition, so it should be fine (this is going on 1.8, right?).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-3000
16716	ACCUMULO-2997	Reading the comment, I'm not sure this is actually a bug. The comment implies that the race condition is not an issue. Should this ticket be closed as "Not a Problem"?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2997
16717	ACCUMULO-2992	How about an annotation, something like {{@ServerOnly}}? It may even be possible to have the compiler complain when it sees it used incorrectly: http://stackoverflow.com/questions/1752607/how-to-intentionally-cause-a-custom-java-compiler-warning-message Barring that, I'm fine with a comment. I'll suggest the class Javadoc for {{SiteConfiguration}}, but I'm open to whatever.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2992
16718	ACCUMULO-2984	is the plan for this to be another implementation of the MiniAccumuloCluster class ala Josh's work to have a cluster that spins up in yarn? or is the plan for it to be alterations on MiniAccumuloClusterImpl? I'd prefer the former if you're looking to run against an Accumulo config rather than e.g. just running against an existing HDFS/ZK.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2984
16719	ACCUMULO-2984	The latter. This is exactly like existing MAC, but just a case of A. providing an external ZK B. (may be optional) providing an external site.xml file and C. telling it not to try to initialize. Why would you prefer the former?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2984
16720	ACCUMULO-2981	Is there a checkstyle rule or something we could use to enforce not having a "_" identifier show up again?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2981
16721	ACCUMULO-2981	bq. Is there a checkstyle rule or something we could use to enforce not having a "_" identifier show up again? I do not know. However, to put this in context, we've had precisely one variable named "_" since the project began.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2981
16722	ACCUMULO-2981	-1. Why are we using a character that is difficult to type on traditional keyboards? What's wrong with T/F if we still want single character labels. Also, there were a bunch of other changes in here that should have been their own issue.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2981
16723	ACCUMULO-2981	[~mdrob] wrote: bq. Why are we using a character that is difficult to type on traditional keyboards? What's wrong with T/F if we still want single character labels. The underscore character was originally chose explicitly to make the table which documents the state change operations more readable. I chose a Unicode character which is just as valid as any other character in Java, which preserved the original readability intentions. I did try T/F and _X/__, but this choice looked the best to me. This character's usage is isolated to the array initialization, and should have minimal impact on future development. If you think another combination would be better, please feel free to change the variable name to your preferred character(s). bq. Also, there were a bunch of other changes in here that should have been their own issue. The only other changes in this commit were a type safety check of a generic method which prevented compilation on JDK8, and a change to the POM to make it easier for me to run a test build against 1.8. I wouldn't consider those two "a bunch". They were the minimum changes I needed to make in order to actually test the change. They're also pretty trivial. If you have an objection to either of those changes, feel free to open a new issue.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2981
16724	ACCUMULO-2976	Wouldn't this make more sense as part of the watchdogs people implement? Perhaps if it gets killed x times in y period, don't restart it.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2976
16725	ACCUMULO-2969	How do you plan on handling stale table mappings?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2969
16726	ACCUMULO-2969	can't we just make the thrift call whenever we need the mapping? and maybe a periodic poll for the table name tab completion?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2969
16727	ACCUMULO-2969	When accumulo began to support table renames, a lot of tablename -> tableid lookups were done in client code. {{Tables}} is used for those lookups. Given the asynchronous notification of zookeeper, we don't really know the true table state at the moment a change is made. How important is it to use zookeeper callbacks to keep the table list current?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2969

#	Requirement	Questions	Answered	Successfully Answered	URL
16728	ACCUMULO-2959	Last time I tried this, TravisCI couldn't handle the ITs. Are you just planning on enabling the unit tests?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2959
16729	ACCUMULO-2959	Could we achieve these same goals by updating our ASF Jenkins builds?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2959
16730	ACCUMULO-2959	I don't think so. I'm interpreting the goal as making it easier for a user with their own fork to set up automated builds. Does the ASF jenkins let anonymous clones take up resources on it?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2959
16731	ACCUMULO-2959	Also, just noticed that you're not listed on the [contributors page|http://accumulo.apache.org/people.html], [~mikewalch]. Would you like to be? (optionally with employer and/or timezone)	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2959
16732	ACCUMULO-2951	I cannot reproduce. If it was related to thrift, could it have been fixed by ACCUMULO-2950?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2951
16733	ACCUMULO-2946	These two classes have two different interfaces, o.a.a.core.client.admin.TableOperations and o.a.a.core.client.admin.NamespaceOeprations with a lot of relative documentation. First thought: do you see collapsing the common methods into generic ones with <table> or <namespace> parameters? This may require the addition of a third interface that holds the generics and the original interfaces having those specific to their scope. Second thought: should a CommonOperationHelper class hold those methods that are needed by o.a.a.core.client.admin.NamespaceOperationsHelper and o.a.a.core.client.admin.TableOperationsHelper and use the boolean flag to set the scope as table or namespace respectively? I would mind work this issue with some guidance. Feel free to assign it to me and provide some implementation details.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2946
16734	ACCUMULO-2944	In an effort to make this painless for users, could we use the java -version from the $JAVA_HOME to figure out which JVM should be configured?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2944
16735	ACCUMULO-2944	Corey, frequently the default JAVA_HOME in the shell might not be set with the desired JVM since a number of different versions could be installed. I agree that it might be desirable to suggest the JVM installed on JAVA_HOME as a default selection if no other specific ones are selected. Should this be recorded as an enhancement in a separate JIRA?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2944

16748	ACCUMULO-2933	bq. If the intention is to run performance tests to compare releases These comments, ACCUMULO-2368, and ACCUMULO-2766 have me desiring a test suite that times many different Accumulo operations. It would be so nice to have this inorder to detect to detect regressions. Accumulo has a lot of test for ensuring various operations are correct, but not much in the way of performance. Could time operations like the following and produce a report that could be compared w/ reports from other releases. * time creating tables * time deleting tables (w/ data, w/o data, w/ data in memory, w/ compactions running, w/ scans running) * time splitting (empty table, table w/ files) * time merging * time cloning (empty table, table w/ files) * time exporting a table * time importing a table * time bulk import * time group commit * etc	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2933
16749	ACCUMULO-2932	It would be preferable to prevent tablets that have different durability configurations from using the same WAL. Presuming that the user configuring things tunes down durability on some table because they need the performance gain. Should we really *always* sync the WALs involved in accumulo.metadata? I can see defaulting to it or even requiring that changing it be done at the table level (presuming we still ahve some system-wide default used for tables). But what if the user has stable backup power and isn't worried about other sources of sudden machine loss?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2932
16750	ACCUMULO-2932	bq. It would be preferable to prevent tablets that have different durability configurations from using the same WAL. Presuming that the user configuring things tunes down durability on some table because they need the performance gain. This would be much easier if a tablet could use multiple WALs (ACCUMULO-1083), but that's a difficult problem in itself. Specifying the explicit file name log in each tablet row does make this easier to track, but it's not required to do what it outlined here. bq. Should we really always sync the WALs involved in accumulo.metadata? I can see defaulting to it or even requiring that changing it be done at the table level (presuming we still ahve some system-wide default used for tables). But what if the user has stable backup power and isn't worried about other sources of sudden machine loss? Sure, that's a valid point.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2932
16751	ACCUMULO-2927	Yeah, I was trying to avoid all global ignores (notice that I prefixed the IDE ones with /), so nothing unusual (like IDE files outside of any actual module) would be hidden from users. Should I push or did you want to make changes first?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2927
16752	ACCUMULO-2916	Are there features that you would like to see in ZK 3.4? AFAIK, there are no serious bugs with 3.3.6 and it is very stable.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2916
16753	ACCUMULO-2913	up high enough) would be to find an invocation where we passed in a null SecurityErrorCode into AccumuloSecurityException (which is a lot of places). 16754	ACCUMULO-2913	Commit 643aaed80039f870a247f8c8e167152fd8b52b76 in accumulo's branch refs/heads/master from [~elserj] [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=643aaed] ACCUMULO-2913 More replication test stabilization. Remove commented code, retry some checks for replication data a few times before failing the test, and remove the defaultTimeoutSeconds because it was overriding what was actually configured in the JUnit timeout annotation.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2913
16755	ACCUMULO-2913	Is there more work to be done on this? The sub-tasks are complete, and there are several commits already logged for this issue.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2913
16756	ACCUMULO-2905	bq. the core issue is that the memory manager is not being called because the mechanism that will trigger it only runs the manager once a second. Can you expand on this, [~ecn]? I see the block that [~vines] was talking about (250ms), but I don't see how the manager would only be invoked once a second. It appears to me that it will start running immediately after construction of the class and then every 250ms (as mentioned).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2905
16757	ACCUMULO-2905	What loop?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2905
16758	ACCUMULO-2905	bq. What loop? Pretty much the stuff after {noformat} if (startMinC) { {noformat}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2905

#	Requirement	Questions	Answered	Successfully Answered	URL
16759	ACCUMULO-2889	bq. We could just add all the hosted tablets to the log when it is new (common), and when new tablets are hosted (rare). Could also try to be a little smarter and keep some basic measure of "recently written to" tablets and update the log entry there instead of all tablets. That would help the write-once, read-many case that's common. bq. This would cause unnecessary recoveries in the case where a tablet is flushed or isn't otherwise using the log. I'm not entirely clear on what performing log recovery for a tablet using a WAL that doesn't have any updates for that tablet entails. Would we just be sorting and re-reading that WAL to not find any updates that need to be replayed? Do you think we would incur a noticeable penalty for doing this?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2889
16760	ACCUMULO-2886	Very nice! Much better than before. Also, noticed the following included in your patch {code} --- a/pom.xml +++ b/pom.xml @@ -708,7 +708,7 @@ <plugin> <groupId>org.codehaus.mojo</groupId> <artifactId>exec-maven-plugin</artifactId> - <version>1.3.2</version> + <version>1.4.0</version> </plugin> <plugin> <groupId>org.eclipse.m2e</groupId> {code} Did you mean to commit that as well? Seems unrelated.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2886
16761	ACCUMULO-2883	bq. there may be room for some sort of permission model on metadata if we plan on exposing this more publicly. I was thinking about this problem this morning. Right now, anyone with a minor bit of cunning could read the metadata table and get the same information (because we can't restrict read access to it), right? Is that a fundamental problem we just have to accept? How could an extra permission layer on top help us increase the total security of the system? I'm not sure presently :)	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2883
16762	ACCUMULO-2877	Could you reformat the patch so that it only contains the fix for ACCUMULO-2877? At the moment it also includes two previous commits.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2877
16763	ACCUMULO-2877	Is there a way we can fold this functionality into a part of the public API? I'm all for easing transitions (e.g. by leaving this in place for 1.5.x and 1.6.x), but I don't want us to get into the habit of leaving non-public API code in place because it's being used externally.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2877
16764	ACCUMULO-2877	bq. If the client API does not call CachedConfiguration, then the method is not necessary. We could re-open ACCUMULO-43. Would it make sense for public API methods that interact directly with HDFS ({{TableOperationsImpl#importDirectory}}) to accept a Configuration object? We could add that support moving forward, deprecate the version that relies on CachedConfiguration, and then have a clear time when we can remove CachedConfiguration. It looks like OfflineScanner could also benefit from the same approach (although we could create a Configuration with the relevant information from accumulo-site.xml too).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2877
16765	ACCUMULO-2866	Can you explain what exactly "makes sense"?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2866
16766	ACCUMULO-2866	The WAL should be a single block. A recovery file might be made into multiple smaller blocks... is that what you're thinking about?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2866
16767	ACCUMULO-2861	I was looking around in the code and found one of the things I have bumped into before. Table permissions, system permission, and namespace permission are encoded using the binary ordinals of the enum. So when dumping zookeeper a lot of base64 shows up instead of things like READ,WRITE, etc. In 1.6 the code that does this encoding is in {{org.apache.accumulo.server.security.handler.ZKSecurityTool}}	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2861
16768	ACCUMULO-2861	bq. we'd get better performance by just creating a POJO and using jackson for serialization. Is that opinion or fact? The reason I was leaning towards thrift or protobuf is that we can use them to ensure that we're backwards compatible. Ensuring that with POJOs would be a bit more difficult and error-prone.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2861
16769	ACCUMULO-2855	A lookup attempt could be fine... I just find them to be problematic, because they make too many assumptions, and those assumptions may be completely invalid. Which NIC are you going to use? Which IP, if the NIC has multiple? Which hostname do you use if DNS reports multiple? What if the hostname known locally is not the one used publicly? Worse, we have to maintain the code that implements these assumptions, while artificially limiting users for whom these assumptions are invalid. And, the invalidity of these assumptions is possibly quite frequent, due to infrastructure like EC2, where users have separate private IP address space and public IP address space, and a DNS that they may have less control over. Of course, we could do both: allow explicit configuration and default to some heuristic... but then, we're adding a lot more complexity and potential for confusion for users that makes debugging harder. This is why I think software like httpd does it best when they just make it explicitly configurable (as in the Listen and ServerName directives in httpd.conf).	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2855
16770	ACCUMULO-2855	bq. it might be better to extend MAC with a more generic cluster. I think Josh Elser was interested in doing something like that. I think for MAC's case, you'd still just want to provide a single hostname/addr to use for binding since its intent is to run solely on a single host. Things change in a lot of other ways too when you start thinking about using other deployment systems to programmatically run a cluster. bq. This is why I think software like httpd does it best when they just make it explicitly configurable (as in the Listen and ServerName directives in httpd.conf). I'd agree here. How about allowing a hostname/IP value to be used for MAC, default it to localhost so it continues to work as it does now, and then let the resolution happen as the network is configured? That would keep up from making any weird assumptions and satisfy Bill's original desire.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2855
16771	ACCUMULO-2855	bq. How about allowing a hostname/IP value to be used for MAC, default it to localhost so it continues to work as it does now, and then let the resolution happen as the network is configured? That's basically what I was thinking, too.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2855
16772	ACCUMULO-2851	We definitely wouldn't want to change how this functionality works, and, like Eric, I think removing them is the common case. However, I could see us adding something to the API which will not delete them if the user sets that option. Would that be satisfactory?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2851
16773	ACCUMULO-2844	Why make the change in the bug fix branches?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2844
16774	ACCUMULO-2844	I'd rather not debate if "master" is still offensive. I initially had thought Leader would work. When I started going through what the role does, I wasn't as sure. * Manage tablet assignments / balancing * Recovery coordination * Run FATE ops * Respond to Admin API commands * Handle restructuring ZK / write to HDFS stored metadata during upgrades Anything else it does?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2844
16775	ACCUMULO-2844	The biggest technical concerns I have are the backwards compat, which you plan to address (yay). I worry a bit about user confusion on these branches as well (I used a "slaves" file previously, but now I can use a "slaves" file or a "tservers" file, _why can I use either?_, _do they do different things?_, etc). I would rather the terminology be changed only in master, but I wouldn't -1 it if this was applied in earlier versions in a compatible manner. Conductor or Coordinator work for me as a new name for the Master. Something that doesn't imply that tservers must talk to the master before performing any action or similar.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2844

#	Requirement	Questions	Answered	Successfully Answered	URL
16776	ACCUMULO-2844	This is a good change to make for 1.7. Making the change in 1.5 and 1.6 seems like it would require a lot of extra work and testing (that would not be needed in 1.7) in order to ensure it does not break things for users. Also as [~bills] mentioned, the old names will still be present in 1.5 and 1.6 for compatibility reasons. I really like [~billie.rinaldi] suggestion for 1.5 and 1.6. bq. It may also be worth evaluating whether "master" is still offensive in the absence of "slaves". Renaming the slaves file to tservers will likely not cause users problems and it seems to solve the problem at hand. The term master by itself does not seem offensive, its a very widely used and uncontroversial term. While master by itself does not seem offensive, it also is not very accurate. Common uses are related to someone who is an expert. Renaming the slaves files leaves us with something thats just poorly named. Engineers often poorly names things. I really like a lot of the other names that have been suggested. As for renaming things in the master branch and not in 1.5-SNAPSHOT or 1.6-SNAPSHOT, git handles this really well. If the change were made in 1.5 and 1.6, would we post two sets of documentation on the web site? One for 1.6.0 and one for 1.6.1 using the different terminology?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2844
16777	ACCUMULO-2844	Haha, the timing is funny with both you revisiting this at the same time. I agree with both... this would be great for 2.0. Will look at the PR more closely tomorrow if I get a chance (unless it gets merged in before that... in which case, awesome). I did see that the PR didn't address it in the replication code. Josh, are you going to handle that part?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2844
16778	ACCUMULO-2844	bq. I did see that the PR didn't address it in the replication code. Josh, are you going to handle that part? Oh drat, I introduced more in there? I tried to use the terminology "peer". I'll have to grep. bq. I agree with both... this would be great for 2.0. Will look at the PR more closely tomorrow if I get a chance (unless it gets merged in before that... in which case, awesome). I just looked at the latest from Mike and think it looks fine to me. I will grep around to see what's there for replication, but am leaning towards just merging it in today.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2844
16779	ACCUMULO-2844	bq. I will grep around to see what's there for replication I see that some references sneaked in via the documentation. Why don't I just break out some sub-tasks and merge in Mike's stuff now. We can work on this in tandem.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2844
16780	ACCUMULO-2844	I think this is sufficiently done, and can be closed. Is there more to be done?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2844
16781	ACCUMULO-2844	bq. I think this is sufficiently done, and can be closed. Is there more to be done? Is there interest to also rename the "master" Accumulo process? Personally, I would like to see s/master/coordinator/ and s/garbage collector/janitor/, but I'm not sure what others think could/should be done for 2.0. In writing/speaking, I think both of these renames would remove a bit of ambiguity (e.g. does "master" refer to the "accumulo master" or a special physical node which different hardware than the other nodes? does garbage collection refer to the JVM or the accumulo "garbage collector" process?), and help ignore the previous debate of "\{offensiveness with the lack of slaves\}". There was concern about API compatibility also previously stated with such a rename. At a quick glance, I only see {{getMasterStats}} on the thrift RPC method side. As everyone knows, Thrift is great about letting us build cross-version compatibility between clients/servers. I would think that we could rename most instances, and leave those necessary for backwards compatibility there. I believe that we can change the general tone to something that provides greater clarity and reduces the likelihood to offend someone.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2844
16782	ACCUMULO-2842	What is the relationship between this setting and {{dfs.datanode.synconclose}}? If I set this to 'hflush' then do I need to worry about the datanode settings, or are they orthogonal?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2842
16783	ACCUMULO-2841	[~ctubbsii], if you're going to close a ticket for a patch that had a subset of the features mentioned, can you please open and link a follow on ticket and edit the description for what the current ticket actually provided. This patch only provides a place for information on a table. I imagine that it also works for namespaces, but there are no tests for it. And there's no ability to watch for changes.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2841
16784	ACCUMULO-2841	[~vines]: Yes, I can, and I would have had I recognized it to be the case that the patch only provided a subset. However, I did not interpret the work done to be a subset of the requested features, since I requested them, and all my expectations were satisfied. If they had not been, I would have commented accordingly on Jenna's pull request. There was only one other commenter (you), who I could have had any reasonable suspicion of having different expectations, but I did not interpret your comment back in June (phrased as *I'm wondering if we should...*), to represent a blocker or requirement for this issue, especially since you did not follow up in comments later about the original idea being metadata-oriented (which would have made your suggestion much, much, harder). That is the only feature I can imagine you mean was omitted, when you say "subset". I did, just now, create ACCUMULO-3121, in regards to your comment. While I didn't consider it within scope of the original identified issue here, I liked it enough to support a ZK solution to this issue so that future work could be done if somebody were interested in creating a ticket and pursuing that. However, I wouldn't have thought it to be my specific responsibility to create that issue just because the issue in which it was mentioned was closed by me, as you've implied. Anybody interested in that feature could have done that, but I've created it as requested, regardless. Since it was me, I hope the wording accurately represents your intentions/expectations for that follow-on work (because I didn't/can't know precisely what you had in mind when you first speculated about it in the comments above). Regarding namespace and permissions testing, all per-table config already works for namespaces, and that's tested separately, as well as tests for permissions to set properties. Those tests continue to pass after this patch. Because the implementation was a minor extension to an existing feature, in which those things are already tested, I thought the patch's provided test, which is more narrowly scoped to testing the provided change set, was sufficient. Had the implementation been a different one, in which those additional requirements were provided by a new mechanism, certainly, I'd have required tests for those new mechanisms before signing off on the patch. This brings up an interesting question: *is a patch for a new feature, which leverages existing features, expected to test the existing features because it relies on them to satisfy the new feature's requirements?* If the answer is "yes, always", it seems we could spend a lot of time writing redundant tests, which don't provide any additional meaningful code coverage. I think the answer is probably "sometimes", and I'd probably lean towards testing those existing features when they are used in a complex way, not covered by the existing test suite for those old features. I don't think that's the case here, though. This new feature isn't complex and doesn't change anything with regard to per-table configuration permissions or the use of per-table configuration items in namespace configs. Those features already are tested and work in the general case (regardless of which property is being set), so they should work in this case, also (setting a property with this new prefix). I don't think any additional tests for this are essential. If you still feel those additional tests are necessary, could you please create a sub-task, though?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2841
16785	ACCUMULO-2837	Dropping priority and changing from "Bug" to "Improvement", because it doesn't appear to represent an essential change. [~kturner], is there more to be done on this? All the sub-tasks appear to be complete. Was closing the parent simply overlooked, or did you want to add a sub-task to address the gzipping?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2837

#	Requirement	Questions	Answered	Successfully Answered	URL
16786	ACCUMULO-2827	This seems to be a pareto improvement on the previous HeapIterator, and it doesn't change any interfaces. Is anyone opposed to getting this into 1.5.2 and 1.6.1?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2827
16787	ACCUMULO-2827	The benchmark graph certainly looks promising and the changes seem straightforward enough. Have you considered running some before/after marks using continuous-ingest? Assuming we see an improvement in practice, I'd likely be in favor of including this in the 1.5 and 1.6 lines.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2827
16788	ACCUMULO-2827	[~parkjsung] bump ^^ -- Have you run any "end-to-end" benchmarks with these changes?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2827
16789	ACCUMULO-2827	Did you only do a single compaction using each of the old and new iterators, or is that a single sample intended to be representative of things? The most thorough thing might be to have a profiler hooked up and see how long the HeapIterator takes, so that we can ignore things like shell start-up time (which is often non-trivial).	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2827
16790	ACCUMULO-2827	This was only a single compaction using each of the old and new iterators. Any more details on hooking up a profiler and seeing how long the HeapIterator takes? By profiler, do you mean something like jvisualvm? Do you want us to try and profile a major compaction as its running in a tserver vs a test harness? How would you like the profiler hooked up? Typically we've found that attaching profilers to the iterators greatly affect the performance. It should still show the benefit from this change though. Would those results be valid?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2827
16791	ACCUMULO-2827	It's interesting that all of the single column tests were slower. Is there a reason for this? Is there an ability to detect a single column in the RFile index and switch implementation at runtime?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2827
16792	ACCUMULO-2827	Yes, yes I was. [~kturner] - Looks like you pushed? Can the JIRA be marked as resolved?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2827
16793	ACCUMULO-2825	Github user joshelser commented on the pull request: https://github.com/apache/accumulo/pull/7#issuecomment-43547788 @ryaneleary I know you had mentioned that you wanted this abstraction point for a reason, but I don't recall what it was. Can you elaborate on the types of operations that this abstract class provides, some use case that the WholeRowIterator didn't sufficiently provide, and, if you have it, maybe an example class? That might help cement this for when/why a user would want to extend RowEncodingIterator	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2825
16794	ACCUMULO-2817	As for creating new issues, I wanted to see how the discussion here went before doing that. Was thinking of adding new decode method to the current implementations w/o changing the interface. Code like the following using the concrete implementations could still be written, which seems useful. In the future when we switch to Java8 we can modify the interface. What are the pitfalls of this approach? {code:java} LongLexicoder longLex = new LongLexicoder(); long l = longLex.decode(data, 5, 13); {code}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2817
16795	ACCUMULO-2817	Realized I need to add in bounds checking to all of the {{decode(byte[], int, int)}} impls. So, two design questions: 1. Bounds checking wouldn't be necessary for when {{decode(byte[])}} calls the other method, so would it be a good idea to do the following, or is this over-optimizing? {code:java} @Override public T decode(byte[] b) { return decodeUnchecked(b, 0, b.length); } /** @since 1.7.0 */ public T decode(byte[] b, int offset, int len) throws ValueFormatException { if (offset + len > b.length) { throw new ValueFormatException(String.format("offset + length %d exceeds byte array length %d", (offset+len), b.length)); } else { return decodeUnchecked(b, offset, len); } } /** @since 1.7.0 */ public T decodeUnchecked(byte[] b, int offset, int len) { ... } {code} 2. Do we agree it would be prudent to make a {{public abstract class AbstractEncoder<T> implements Encoder<T>}} that has the above boilerplate {{decode(byte[], int, int)}} and {{decode(byte[])}} methods?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2817
16796	ACCUMULO-2817	Rebased onto master at revision {{8f6558c}} This patch has my ideas on how abstract classes could be used. * Removed {{decode(byte[], int, int)}} from the Encoder (and thus also Lexicoder) interfaces, leaving them the same as on master. * Added {{org.apache.accumulo.core.client.lexicoder.AbstractEncoder}}. It implements {{decode(byte[])}} (required by Encoder interface), and {{decode(byte[], int, int)}} (not part of an interface). It then defines {{protected abstract T decodeUnchecked(byte[] b, int offset, int len)}}. This does not change the Encoder or Lexicoder interfaces. * Added {{org.apache.accumulo.core.client.lexicoder.AbstractLexicoder}}, which extends AbstractEncoder and also implements Lexicoder. * Refactored Lexicoders to extend AbstractLexicoder, and Encoders to extend AbstractEncoder. I think AbstractEncoder and AbstractLexicoder should be part of the public API since they may be useful to others, and do not cause any breaking changes. I looked through semver, and I don't think "any backwards incompatible changes are introduced to the public API," but feel free to correct me. *Question:* Do I add "@since" to any public methods, or only ones implementing an Interface, or all new methods?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2817

#	Requirement	Questions	Answered	Successfully Answered	URL
16797	ACCUMULO-2817	{code} diff --git a/core/src/main/java/org/apache/accumulo/core/replication/proto/Replication.java b/core/src/main/java/org/apache/accumulo/core/replication/proto/Replication.java index 030f4ec..72f706a 100644 --- a/core/src/main/java/org/apache/accumulo/core/replication/proto/Replication.java +++ b/core/src/main/java/org/apache/accumulo/core/replication/proto/Replication.java @@ -449,6 +449,17 @@ package org.apache.accumulo.core.replication.proto; throws com.google.protobuf.InvalidProtocolBufferException { return PARSER.parseFrom(data, extensionRegistry); } + public static org.apache.accumulo.core.replication.proto.Replication.Status parseFrom(+ byte[] data, int offset, int len) + throws com.google.protobuf.InvalidProtocolBufferException { + return PARSER.parseFrom(data, offset, len); + } + public static org.apache.accumulo.core.replication.proto.Replication.Status parseFrom(+ byte[] data, int offset, int len, + com.google.protobuf.ExtensionRegistryLite extensionRegistry) + throws com.google.protobuf.InvalidProtocolBufferException { + return PARSER.parseFrom(data, offset, len, extensionRegistry); + } public static org.apache.accumulo.core.replication.proto.Replication.Status parseFrom(java.io.InputStream input) throws java.io.IOException { return PARSER.parseFrom(input); {code} This is generated code. You don't need to be changing it. {{StatusCombiner}} will just have to be changed to call the necessary method on {{Status}} if no methods are exposed already. {code} try { Preconditions.checkNotNull(b, "cannot decode null byte array"); } catch (NullPointerException e) { throw new ValueFormatException(e); } try { Preconditions.checkArgument(offset >= 0, "offset %s cannot be negative", offset); } catch (IllegalArgumentException e) { throw new ValueFormatException(e); } try { Preconditions.checkArgument(offset + len < b.length, "offset + length %s exceeds byte array length %s", (offset + len), b.length); } catch (IllegalArgumentException e) { throw new ValueFormatException(e); } {code} You don't need to catch the Exceptions thrown by Preconditions. They're RuntimeExceptions -- just let them filter up. bq. Do I add "@since" to any public methods, or only ones implementing an Interface, or all new methods? Adding it to AbstractEncoder as you did is good. I think AbstractLexicoder is better off being in {{org.apache.accumulo.core.client.lexicoder.impl}} which would not need to have the annotation. Generally speaking, if you're introducing a new class into the [public API|https://github.com/apache/accumulo/blob/master/README.md#api], you can just add it at the class level and you don't need the method-level annotations. When new methods are added into that class later, {{since}} would be added on those methods. {code} /** * Calls {@link #decodeUnchecked(byte[], int, int)} as {@code decodeUnchecked(b, 0, b.length);}. * Does not check if b is null. */ @Override public T decode(byte[] b) { return decodeUnchecked(b, 0, b.length); } {code} Why not check that {{b}} is non-null? bq. I looked through semver, and I don't think "any backwards incompatible changes are introduced to the public API," but feel free to correct me. The concern is that a user who implemented their own Lexicoder against 1.6.x would suddenly stop working with 1.7.0. The way you currently did it looks fine to me (Lexicoder hasn't ultimately changed only the implementations in such a way that only adds a new method).	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2817
16798	ACCUMULO-2817	bq. Hi folks, I'm interested in calling decodeUnchecked(byte[], off, len) as public API, since it removes the need to copy a subarray out from a larger array. Can we pull this discussion into another JIRA issue, [~dhutchis]? It would get confusing to track since this changeset was already released in 1.7.0.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2817
16799	ACCUMULO-2815	For comparison, do you have the numbers for SSL?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2815
16800	ACCUMULO-2815	That's okay. I was just thinking SSL in Accumulo. But, now that you mention it, I was kind of assuming HDFS/ZK were set up the same on all these scenarios (either with or without Kerberos). Are you suggesting that is not the case? That the HDFS settings are also configured with the above Kerberos settings (or none)?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2815
16801	ACCUMULO-2815	In other words, do these numbers reflect Accumulo's overhead with Kerberos, or do they represent the overhead of an entire system configured end-to-end with Kerberos?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2815
16802	ACCUMULO-2815	What do the headings mean?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2815
16803	ACCUMULO-2808	[~ctubbsii] - Do you need any more feedback on this before applying it?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2808
16804	ACCUMULO-2803	This looks good. Can you submit a patch generated using {{git format-patch}} so that the commit attributions are correct? Thanks!	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2803
16805	ACCUMULO-2799	I'm on to my second implementation of a "drain" operation which a client can invoke to know "when the data has been replicated" for a table. There are a couple of caveats here that make this difficult. * You might get a new WAL for a table even if no data has been ingested into it (WALs are per-tserver, not per-table) * How do you implement it with constant ingestion? Prevent the user from making a call that will never complete. (Is that intended?) What I've done for the present is take a snapshot of the current WALs in use by a table (using the metadata table and the 'log' colfam) and wait for all of those WALs to be fully replicated. This at least addresses both of the above points, but I'm still not positive if this is the "best" semantics for it. Thoughts, anyone else?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2799
16806	ACCUMULO-2797	Are there any non-English speaking people who could support this effort? I, unfortunately, am a mono-linguist.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2797
16807	ACCUMULO-2792	Vikram, can you check if this first change in 1.5 or in 1.6?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2792
16808	ACCUMULO-2789	[~bills] do you have more here that you're planning on doing? Do we want to add any higher-level documentation for this? I don't recall off the top of my head if we have docs elsewhere for continuous-ingest and randomwalk that we could add this to.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2789
16809	ACCUMULO-2789	Commit f0dcf1e5570c12098e716ec58ea2f4bc3321053b in accumulo's branch refs/heads/1.5.2-SNAPSHOT from Bill Slacum [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=f0dcf1e] ACCUMULO-2789 Added parameter to control the number of cells within a row When running the stress test, it is now possible to configure the writer to send mutations for rows that contain a random amount of column updates. This is controlled via the --min-row-width, --max-row-width and --row-width-seed parameters. I did some internal shuffling to make randomly generating numbers within a range more convenient. See the new RandomWithinRange class for details.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2789
16810	ACCUMULO-2789	Commit f0dcf1e5570c12098e716ec58ea2f4bc3321053b in accumulo's branch refs/heads/1.6.1-SNAPSHOT from Bill Slacum [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=f0dcf1e] ACCUMULO-2789 Added parameter to control the number of cells within a row When running the stress test, it is now possible to configure the writer to send mutations for rows that contain a random amount of column updates. This is controlled via the --min-row-width, --max-row-width and --row-width-seed parameters. I did some internal shuffling to make randomly generating numbers within a range more convenient. See the new RandomWithinRange class for details.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2789

16811	ACCUMULO-2789	Commit f0dcf1e5570c12098e716ec58ea2f4bc3321053b in accumulo's branch refs/heads/master from Bill Slacum [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=f0dcf1e] ACCUMULO-2789 Added parameter to control the number of cells within a row When running the stress test, it is now possible to configure the writer to send mutations for rows that contain a random amount of column updates. This is controlled via the --min-row-width, --max-row-width and --row-width-seed parameters. I did some internal shuffling to make randomly generating numbers within a range more convenient. See the new RandomWithinRange class for details.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2789
16812	ACCUMULO-2784	Does this ticket carry with it any particular design of experiments requirements? e.g. workload, iterations, etc?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2784
16813	ACCUMULO-2781	The stack trace is: {code:java} java.io.IOException: Can't get Master Kerberos principal for use as renewer at org.apache.hadoop.mapreduce.security.TokenCache.obtainTokensForNamenodesInternal(TokenCache.java:116) at org.apache.hadoop.mapreduce.security.TokenCache.obtainTokensForNamenodesInternal(TokenCache.java:100) at org.apache.hadoop.mapreduce.security.TokenCache.obtainTokensForNamenodes(TokenCache.java:80) at org.apache.hadoop.mapreduce.lib.output.FileOutputFormat.checkOutputSpecs(FileOutputFormat.java:142) at org.apache.hadoop.mapreduce.JobSubmitter.checkSpecs(JobSubmitter.java:456) at org.apache.hadoop.mapreduce.JobSubmitter.submitJobInternal(JobSubmitter.java:342) at org.apache.hadoop.mapreduce.Job$10.run(Job.java:1268) at org.apache.hadoop.mapreduce.Job$10.run(Job.java:1265) at java.security.AccessController.doPrivileged(Native Method) at javax.security.auth.Subject.doAs(Subject.java:415) at org.apache.hadoop.security.UserGroupInformation.doAs(UserGroupInformation.java:1491) at org.apache.hadoop.mapreduce.Job.submit(Job.java:1265) at org.apache.hadoop.mapreduce.Job.waitForCompletion(Job.java:1286) at org.apache.accumulo.core.client.mapreduce.AccumuloFileOutputFormatTest$MRTester.run(AccumuloFileOutputFormatTest.java:154) at org.apache.hadoop.util.ToolRunner.run(ToolRunner.java:70) at org.apache.accumulo.core.client.mapreduce.AccumuloFileOutputFormatTest$MRTester.main(AccumuloFileOutputFormatTest.java:163) at org.apache.accumulo.core.client.mapreduce.AccumuloFileOutputFormatTest.writeBadVisibility(AccumuloFileOutputFormatTest.java:195) {code}	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2781
16814	ACCUMULO-2762	bq. it could cause problems That's adequately, vaguely obtuse... Context?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2762
16815	ACCUMULO-2760	The intent of the test is to have the server's I/O hang, and have the master status monitoring fail. The master should remove the tserver's lock, which should kill it. We're seeing the tserver killed, but it seems to be happening because it is missing zookeeper deadlines, and not due to any action by the master. At least, not always.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2760
16816	ACCUMULO-2739	Urk, looks like {{Halt.halt(int, Runnable)}} is going to be a pain to deal with. I'm a little worried about changing code that was added to try to make these processes exit more gracefully. Since these are just running in their own threads (for the purposes of this issue), I would think that we have to ensure that Interrupting each process (thread) needs to then exit gracefully. Is there a better way to try to do this? (cc/ [~bhavanki])	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2739
16817	ACCUMULO-2739	[~elserj] do you know that spawning processes is whats making MAC slow? I am sure thats part of it, but is it the largest contributor? For example the interaction between master, root table and metadata table inorder to get first user tablet online could possibly be much slower than spawning processes. I looked into this type of thing a long time ago, but can not remember much. ACCUMULO-879 are an example of problems that have nothing to do w/ separate processes.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2739
16818	ACCUMULO-2739	Just for argument's sake, I'll mention Docker because it is supposed to start nodes in milliseconds. I know that people use Docker for Hadoop. Has anyone here used Docker?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2739
16819	ACCUMULO-2739	I'm not quite sure what you mean, [~medined]. Are you just stating that starting up fast is desirable? I don't think running Accumulo inside of docker containers is really relevant for what this outlines...	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2739
16820	ACCUMULO-2736	I stand corrected. If that's the case, then I'm not sure the distinction between "Fixed", "Done", and "Implemented"... unless we just want to use "Done" for tasks, and "Fixed" for bugs, and "Implemented" (did you verify that one?) for "New Feature" and "Improvement". If that's the case, then "Done" and "Implemented" *should* have fixVersions on them properly.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2736
16821	ACCUMULO-2732	I'd rather not see the README become a tutorial on maven, especially if it starts making assumptions about a user's build environment (maven version, maven's own resource requirements, or jvm execution paths, etc.). Even in build instructions, we have to make some assumptions that a user is familiar with the build tools or can debug build tool problems with documentation on the build tool itself. MAVEN_OPTS is not an accumulo build option, it's a maven configuration option, so I don't think it should go here. I agree with [~busbey] that this would be more suitable in a contributor guide (specifically, one on the website, or in a wiki).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2732
16822	ACCUMULO-2732	I'll pick this up since I suggested an avenue :) What else besides MAVEN_OPTS are some notable "gotchas" that we would need to include? Could point out the minimum maven version (defined in the pom), as well as supported/recommended JDK.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2732
16823	ACCUMULO-2732	I have a coworker who can reliably reproduce having the core/security/crypto/BlockedIOStreamTest fail on JDK6 with default maven surefire JVM settings, regardless of manipulating the MAVEN_OPTS (since those aren't actually used for forked surefire tests) and having JDK7 installed. The test always passes for me, I suspect because of a combination of default JVM max heap and because my system has no jdk6 (while hers does), resulting in my maven using a JRE7 for running tests even though it's targeting java 6. While specifying a max heap, I have all tests passing at Xmx 756MB while she requires Xmx 1GB [~elserj] (or anyone else) would you mind if she takes this over to contribute a pom fix for the surefire plugin configs? Or would you prefer a new ticket?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2732
16824	ACCUMULO-2731	This is marked as "Fixed", but no fixVersion or commit comments. Was this actually done?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2731
16825	ACCUMULO-2712	Can you give me a pointer as to where to track ASF-17?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2712
16826	ACCUMULO-2705	Shouldn't this just happen as a part of the upgrade process? How did the 1.5 -> 1.6 upgrade create the root table?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2705
16827	ACCUMULO-2705	SystemCredentials really doesn't seem to be the "correct" place for this either as they are explicitly meant for IPC. Should Accumulo internals have the ability to use the public API? I suppose I could try to circumvent things by hitting the {{TableOperations.create(String)}} implementation as a shortcut.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2705

#	Requirement	Questions	Answered	Successfully Answered	URL
16828	ACCUMULO-2689	Is it a good idea to be working around what appear to be bad system configuration issues? You already stated on ACCUMULO-2554 that you think it plausible to be this. Are there other benefits to starting ZK in process? Are you considering this a first step to making an in-process MAC?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2689
16829	ACCUMULO-2680	Before I up the timeout, did either of you notice anything that I might have missed? I saw it in the state where the first master killed itself, the second master was waiting for the lock, saw the "bogus" update that the test submits, but didn't acquire the master lock.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2680
16830	ACCUMULO-2680	[~elserj], what timeout factor were you using?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2680
16831	ACCUMULO-2680	but could you do that change in a follow on ticket? In case the current RC passes and 1.6.0 is closed out?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2680
16832	ACCUMULO-2657	Which Classpath does this property impact? Is it the running Accumulo instance?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2657
16833	ACCUMULO-2655	Also: {noformat} java.lang.Exception: Error running node Shard.xml at org.apache.accumulo.test.randomwalk.Module.visit(Module.java:286) at org.apache.accumulo.test.randomwalk.Framework.run(Framework.java:63) at org.apache.accumulo.test.randomwalk.Framework.main(Framework.java:122) at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method) at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:57) at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:43) at java.lang.reflect.Method.invoke(Method.java:606) at org.apache.accumulo.start.Main$1.run(Main.java:141) at java.lang.Thread.run(Thread.java:744) Caused by: java.lang.Exception: Error running node shard.CompactFilter at org.apache.accumulo.test.randomwalk.Module.visit(Module.java:286) at org.apache.accumulo.test.randomwalk.Module.visit(Module.java:255) ... 8 more Caused by: java.lang.Exception: Saw unexpected document e900000000000000 doc: [] 1397147994361 false at org.apache.accumulo.test.randomwalk.shard.CompactFilter.visit(CompactFilter.java:87) at org.apache.accumulo.test.randomwalk.Module.visit(Module.java:255) ... 9 more {noformat}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2655
16834	ACCUMULO-2655	Does this arise because of multiple walkers running concurrent at the same time? I've noticed that the "ctt" tables it creates aren't namespaced by the walker host like other tests.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2655
16835	ACCUMULO-2655	[~ecn] did all walkers freeze of hang? Can you remove the nodes in the graph that causing hang and rerun?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2655
16836	ACCUMULO-2647	Thanks Jeffrey! Do you want to be listed on the [contributors list|http://accumulo.apache.org/people.html]? If so, how would you like your employer displayed (if at all)?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2647
16837	ACCUMULO-2637	Well, looks like I'm not going to be able to do anything about automation at the moment since I still can't log into ASF jenkins (continuing ldap auth problems?) For everyone else, I assume this was how it was done back in the day? Did someone just occasionally deploy snapshots manually?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2637
16838	ACCUMULO-2630	Can you link to the dev list discussion? I was not able to find it after a cursory search, and think it would be good to include for posterity.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2630
16839	ACCUMULO-2627	[~mdrob], sorry this feel to the wayside. Do you have aspirations/cycles to update this before we ship out 1.7.0?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2627
16840	ACCUMULO-2627	Aspirations, yes. Cycles, no. If somebody else is able to pick up the work I had done and drive it home, that would be excellent. Are we allowed to add the Closeable interface to classes in a minor release? I'm not sure what impact that has on compatibility and am not particularly inspired to check the JLS on this.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2627
16841	ACCUMULO-2627	Looks like this doesn't apply after Eric's run-ITs-over-mapreduce. [~mdrob] plans to revisit this patch? Or should it just be closed as "Later"?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2627
16842	ACCUMULO-2613	Actually, to really drive down recovery time would we need to also ask to pin WALs for the !METADATA table? I think we would.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2613
16843	ACCUMULO-2613	That would be preferable, but couldn't a tablet server just recognize when it was adding a !METADATA related entry to the WAL and then request that it be pinned?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2613
16844	ACCUMULO-2613	How much gain would we get from caching metadata table files when we're already caching them in the tserver?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2613
16845	ACCUMULO-2613	even then, say we pinned all the WALs. how much space is that likely to be? less than 10G per node? that's not too bad on a hardware cluster.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2613
16846	ACCUMULO-2605	Commit 7ac4b54a76b85314a483378e01980c73f891a900 in accumulo's branch refs/heads/1.6.0-SNAPSHOT from [~ecn] [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=7ac4b54] ACCUMULO-2605 list slf4j as a test dependency	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2605
16847	ACCUMULO-2603	This has been marked "In Progress" for over a year. What's the status of this?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2603
16848	ACCUMULO-2594	Is that really relevant? It's garbage to have a class silently do the wrong thing whether or not we explicitly expose it to users. Edit: also, do we even have something that is in the public API that programmatically reports tablet locations?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2594
16849	ACCUMULO-2594	Are tableIds actually checked though? Despite the construction of a TabletLocator instance changing, I don't recall seeing this sanity check being added. The way that a TabletLocator is instantiated is unrelated to the original bug report.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2594
16850	ACCUMULO-2592	bq. That particular experimental annotation was specifically introduced for the configuration I wish you had stated that previously when I mentioned it before writing this up then :) Since you have opinions about this, I assume you also have an interest in how this looks? Such an API can be placed into the release notes for 1.6.0 for advertisement. What else do you want to discuss? Edit: Leveraging Hadoop's InterfaceStability and InterfaceAudience is likely a well suited approach here if you were to ask me. I'd assume they have a good grasp on things by now (not to mention the other projects which also leverage the annotations).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2592
16851	ACCUMULO-2592	I think it's probably a little late for 1.6.0 to begin discussing/documenting what we think "experimental" should mean in order to start annotating the API with that. What exactly does it mean to be experimental? The scope for the configuration annotations was very narrow and functional (as implementation detail to limit exposure of properties in the documentation and shell for features still in some stage of development). But, if we start using it more broadly, we're going to have to define the semantics of that annotation. Perhaps just a comment in the javadoc would be sufficient (which was my suggestion on the mailing list thread)? I'd prefer not to add more Hadoop dependencies just to borrow their annotations, and I'd also rather not blindly borrow the semantics of their annotations without at least some mailing list discussion to see if they are in line with our API goals. I'll create a sub-task for ACCUMULO-2589, to create annotations with well-defined semantics for the API, but for this, I think a simple javadoc comment is sufficient..	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2592
16852	ACCUMULO-2590	Do we need to make explicit that public inner classes are public API all the way down? i.e. if an inner class has an inner class, the inner-inner class will still be public, and so on.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2590

#	Requirement	Questions	Answered	Successfully Answered	URL
16853	ACCUMULO-2590	bq. Do we need to make explicit that public inner classes are public API all the way down? i.e. if an inner class has an inner class, the inner-inner class will still be public, and so on. That would be my expectation. Anything public or protected in an API class is part or the API. This would include methods, variables, classes, interfaces, and enums in the class. Did i miss anything?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2590
16854	ACCUMULO-2590	bq. Anything public or protected in an API class is part or the API. This would include methods, variables, classes, interfaces, and enums in the class. Did i miss anything? I think that's everything. I like that phrasing better as well.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2590
16855	ACCUMULO-2590	How's this suggested patch look for clarifying things?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2590
16856	ACCUMULO-2590	Would it be useful to also to make a statement about compatible between 1.X and 1.(x+1) releases. Deprecated methods may be dropped and methods may be added. Anything not deprecated should continue to work.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2590
16857	ACCUMULO-2589	How about we phrase it "more appropriate use of RuntimeExceptions", and debate the appropriateness of specific uses?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2589
16858	ACCUMULO-2589	Could we use subclasses of RuntimeException to allow for both [~mdrob]'s ease of failing and [~vines]'s desired ability to catch and recover (without have to do the current insanity of parsing strings)?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2589
16859	ACCUMULO-2589	I see that you are making progress on this (https://github.com/ctubbsii/accumulo/tree/ACCUMULO-2589), [~ctubbsii]. Can you give any sort of status here? Any possibility to get a WIP/feature branch up in Apache that we all can collaborate on? It would be good to make sure this doesn't start off in a bubble -- who knows, you might also get help from other devs too ;)	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2589
16860	ACCUMULO-2589	bq. wired to the implementation in the core jar using java's ServiceLoader Interesting, I haven't looked at ServiceLoader at all before. A brief read-up seems like it makes a lot of sense for the future. bq. figure out how we want to do exception handling in the new API (there have been many suggestions) We should start this talk (again) sooner rather than later :). It'll be a doozie. bq. I'm also trying to find a sensible serialization practice that we can use on our "dumb" objects that doesn't depend on Hadoop libraries, but satisfies our serialization needs (in particular, credentials). This is interesting sounding, but I'm not 100% sure what you mean here. The thrift classes we have now? Do you have a separate issue for this already that we can start a discussion on? bq. As for uploading as a feature branch, I didn't want to spam the mailing lists with repeated rebase-ing, at least until it's a bit more stable and ready to contribute back to the project. I can collaborate on GitHub, though. I definitely don't want to discourage help from others... but I'd rather collaborate on GitHub until it's at least a little bit more stable and ready to contribute. My biggest regret in working on replication is how long I let it live in its own branch. This was the easy/lazy decision to make, but I'm convinced it's split me and the feature off from the rest of the community. If it lives in a bubble too long, it just becomes infeasible to bring the other devs up to speed. For replication, this was more "ok" (not saying it was acceptable) because it was an optional feature, but since the client API is of such importance, I would encourage you to start bringing things up for review. Assuming you have your own schedule for things you're working on, could you pull some code into a feature branch in Apache for things you have already worked out? For example, take the ServiceLoader code (or just look at the changes with a focus on the ServiceLoader): we can isolate the changes you've made so far for that, you can get some feedback on it, and then it would be one step closer to making it into master. Even if it changes again later (as pieces likely will), that's not the end of the world -- more than just you can help evolve the new implementation.Thoughts?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2589
16861	ACCUMULO-2589	How do you feel about about TimeUnit?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2589
16862	ACCUMULO-2573	Does something like Swift[1] make sense here? [1] https://github.com/facebook/swift	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2573
16863	ACCUMULO-2572	I meant as an example, not that we would actually hook SEP in, yes. Actually though. It's worth considering trying to build off of the replication support that's in HBase. Especially given the addition of security labels in HBase 0.98, it would be really nice if we got bi-directional HBase and Accumulo replication working. That would substantially lower the barrier for HBase users who wanted to try out Accumulo.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2572
16864	ACCUMULO-2567	Does anyone have objections to doing this?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2567
16865	ACCUMULO-2561	What are our options here? subclassing Error and throwing that? in that case we'd still run shutdown hooks, no? Do we have a design document somewhere that covers why we use the super-fast-stop-the-world version of exiting?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2561
16866	ACCUMULO-2555	I cannot duplicate this issue in my development environment or on my Jenkins environment. Attached is my best guess at a patch. [~ecn] - do you have any way to verify this before I push it?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2555
16867	ACCUMULO-2554	I am unable to reproduce this with Maven 3.0.4 or 3.1.1. Was there something else running on the port? Which OS is this failing on? Have you tried with 3.1.1 or newer Maven? Was this build running concurrently with another build that may have caused a port conflict? Was mvn executed with -T to do parallel builds across modules that both use mini?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2554
16868	ACCUMULO-2554	There shouldn't be any issues with 3.0.4. I guess this is just an issue that plagues mini in general (not being able to reserve a ZK port). I'm not sure if there's a good fix. How frequently do these happen for you? And, do you see any extra failures with the maven-plugin specifically on this (e.g. more reproducible in that module than the test module ITs)?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2554
16869	ACCUMULO-2554	I don't recall ever seeing this either. I guess you have your work cut out to figure out what's happening :)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2554
16870	ACCUMULO-2554	I picked a random MAC dir from a 1.6.0-SNAPSHOT run yesterday. Looking at the following file : {noformat} /local/disk1/jenkins/workspace/accumulo16/test/target/mini-tests/org.apache.accumulo.test.DumpConfigIT_test/logs/ZooKeeperServerMain_1656483996.out {noformat} I see {noformat} 2014-04-16 17:10:10,077 [quorum.QuorumPeerConfig] INFO : Reading configuration from: /local/disk1/jenkins/workspace/accumulo16/test/target/mini-tests/org.apache.accumulo.test.DumpConfigIT_test/conf/zoo.cfg 2014-04-16 17:10:10,078 [server.ZooKeeperServerMain] INFO : Starting server {noformat} then I see {noformat} 2014-04-16 17:10:10,135 [server.NIOServerCnxn] INFO : binding to port 0.0.0.0/0.0.0.0:59228 {noformat} There are no lines in the log containing the string "dt_socket". I grepped every zookeeper out file for that string and did not see it. In the past DNS was flaky on my Jenkins machine and for some reason zookeeper would hang. I jstack the zookeeper server process and saw it was hung in java name resolution calls during initialization. Also I know there was very little in the zk out when this happened, but I can not remember exactly what. Have you been able to jstack?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2554
16871	ACCUMULO-2553	[~sonixbp] Does each reducer process a single group+range? When the map reduce job finishes, how are files associated with groups?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2553
16872	ACCUMULO-2552	Is this really a blocker for 1.6.0? Can we declare Volume support early access for 1.6.0 and then fix these things in a follow on version? Given the history around ACCUMULO-118 it looks like the Volume support change is going to take some soak time to be production ready, and I'd rather not hang up the 1.6.0 release on that happening.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2552

#	Requirement	Questions	Answered	Successfully Answered	URL
16873	ACCUMULO-2552	Found the following (potential) issues: 1. Defaults to fs.defaultFS/fs.default.name for FileSystem. Should use FileSystem from the Path instead of pulling the default. I think this has the potential to throw an error out of Hadoop about using the "Wrong FS" ./core/src/main/java/org/apache/accumulo/core/file/rfile/SplitLarge.java:56: FileSystem fs = FileSystem.get(conf); 2. Just remove the getAndWrap method since it doesn't appear to be used anywhere? ./server/base/src/main/java/org/apache/accumulo/server/trace/TraceFileSystem.java:815: return wrap(FileSystem.get(conf)); 3. Pulls the default filesystem and expects files to be located on it. Likely not of concern because the class itself isn't "generally" recommended. ./server/base/src/main/java/org/apache/accumulo/server/util/AddFilesWithMissingEntries.java:68: final FileSystem fs = FileSystem.get(conf); 4. Log message about the URI being used to find the instance_id is no longer accurate ./server/base/src/main/java/org/apache/accumulo/server/util/ZooKeeperMain.java:43: FileSystem fs = FileSystem.get(CachedConfiguration.getInstance());	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2552
16874	ACCUMULO-2552	[~ecn], you agree that the first two don't represent blockers for 1.6? Do we want to deprecate {{AddFilesWithMissingEntries}} for 1.6.0 to remove it in w/e is next?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2552
16875	ACCUMULO-2546	Isn't this likely just caused by the error in ACCUMULO-2494 not declaring a dep and instead getting commons-math via transitive? hadoop 2.3.0 switched to an incompatibly newer version of commons-math. I think this likely will be fixed as a part of the work [~mdrob] is already doing?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2546
16876	ACCUMULO-2545	What's the reasoning behind adding licenses to otherwise empty files?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2545
16877	ACCUMULO-2541	Something seems.. goofy here. How do we read 10 elements, 5 of which didn't have readhead, in less time than the Slow iterator is configured to run. Those numbers shouldn't be capable of being returned in less than 1 second (1000millis).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2541
16878	ACCUMULO-2538	Has not been failing for days.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2538
16879	ACCUMULO-2537	I have an auto-save action on files I edit in Eclipse that adds this. Is that sufficient, or do we want to enforce application of this globally?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2537
16880	ACCUMULO-2537	I'd rather see a single clean up commit against this ticket along with some kind of enforcement mechanism to make sure new contributions follow the rule. do we do any checkstyle in the build already?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2537
16881	ACCUMULO-2532	[~ecn], something else I noticed while reading through this code: {code:title=FileUtil.java:97-99} // try to reserve the tmp dir if (!fs.createNewFile(new Path(result, "__reserve"))) result = null; {code} It looks like this {{__reserve}} file is never used anywhere else. Do you recall what the intent of making it was?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2532
16882	ACCUMULO-2522	Commit 448a79e00c56684325078cfe257733a450e8f344 in accumulo's branch refs/heads/1.5.2-SNAPSHOT from [~ecn] [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=448a79e] ACCUMULO-2522 fix timeout typo	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2522
16883	ACCUMULO-2514	bq. Can't switch over many of the System.out.printf's since we rely on the exact format of the string in stdout to process the test results and print pretty graphs. I fixed the others. Can't you {{log.info(String.format("%....", str, str))}}?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2514

16887	ACCUMULO-2501	Very sorry that this patch was sitting here idle for so long, [~rweeks]. Thank you very much for the contribution. I applied some minor formatting changes and also added a unit test that explicitly invoked deepCopy. It looked good to me so I applied it. I'll add you to our contributors page as well. Thanks again!	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2501
16888	ACCUMULO-2499	Is there any reason not to apply this patch to 1.6.0, since it's just a documentation update, and 1.6.0 hasn't been released yet?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2499
16889	ACCUMULO-2499	More details per [~elserj], Start with http://en.wikipedia.org/wiki/Ephemeral_port This is a pretty common convention (Jetty and InetSocketAddress are two good examples in the Java realm). When requesting to bind a socket, the port that you provide is typically used directly to state which port you want to bind to on the interface. When you provide '0' instead of some other valid port (e.g. 1-65535), convention states that an ephemeral port will be chosen instead. This ephemeral port is likely to be unique and not already bound. Thus, configuring ports to use '0' instead of some explicit value, should, in most cases, work around any issues of running multiple distinct Accumulo instances (or any other process which tries to use the same default ports) on the same hardware.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2499
16890	ACCUMULO-2499	Hi Al! there's trailing whitespace on both patches, and the commit message for the 1.6 specific patch says "CCUMULO-2499" instead of "ACCUMULO-2499." Could you put up a version 3 set of patches to take care of these things?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2499
16891	ACCUMULO-2499	Hi [~krinker]! Sorry I missed some bits earlier. Why include a ZooKeeper entry? We don't include e.g. port numbers related to HDFS. How about instead, we open with something like "In addition to needing access to ports associated with HDFS and ZooKeeper, Accumulo will use the following default ports." What's the advantage of including the ports used in the 1.6.0 unit tests? AFAIK, those should never come up in a deployment, right? [~ecn] any obvious missing entries?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2499
16892	ACCUMULO-2499	[~krinker] - Are the entries supposed to be the same for 1.5 and 1.6? If so, we can just merge them using a proper merge instead of relying on two patches	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2499
16893	ACCUMULO-2497	I need a little help. What does this actually provide, other then wrapping existing constructors inside another structure?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2497
16894	ACCUMULO-2497	A. I'm not great with mocking, so pardon my ignorance. But couldn't you just as easily mock out Instance instance = new ZooKeeperInstance(...) to sub in your special Instance? B. If this is for testing purposes, wouldn't this live solely in Test code, which means it could live in src/test/java...? I don't know where new ZooKeeperInstance is called in our standard code that would require this.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2497
16895	ACCUMULO-2497	Let me rephrase the second question. Where in the code do we, outside of tests, create ZooKeeper instances? HdfsZooInstance already has a singleton method for grabbing it, which I assume means that is easily mocked. So that just leaves ZooKeeperInstance, which, AFAIK, isn't actually used in our code.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2497
16896	ACCUMULO-2497	Thanks for the example [~bhavanki], helped me understand what you were thinking. It seems liike a useful change. What do you think about developing code that would use this patch in tandem? This patch could be held off until the test that use it are added in another ticket and both patches pushed at the same time. If the change is made by itself there is a chance it will never be used and would be orphaned code from the start. There is also the possibility that when you get into the details of writing the test you realize this should work differently.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2497
16897	ACCUMULO-2491	Commit 4a27da54696ed97b197ce0abd5bef0a2ccfc2b80 in accumulo's branch refs/heads/1.4.5-SNAPSHOT from [~bhavanki] [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=4a27da5] ACCUMULO-2491 Correct table user state upon termination of Security randomwalk A partial backport of ACCUMULO-1162 to 1.4 - commit e93a11a only. As the Security randomwalk ends and drops the table user, it now also sets the user's existence flag to false.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2491
16898	ACCUMULO-2490	Mike, could you give an example of how this makes the API more cumbersome?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2490

#	Requirement	Questions	Answered	Successfully Answered	URL
16899	ACCUMULO-2490	Sure. {code} Pair<Integer,String> pair = new Pair<Integer,String>(10, "XX"); // Doesn't compile: // Type mismatch: cannot convert from Map.Entry<capture#1-of ? super Integer,capture#2-of ? super String> to Map.Entry<Integer,String> Entry<Integer,String> entry = pair.toMapEntry(); // does compile but forces the client to use wildcards. Entry<? super Integer,? super String> entry2 = pair.toMapEntry(); // Doesn't compile either: Entry<Number,CharSequence> entry3 = pair.toMapEntry(); {code}	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2490
16900	ACCUMULO-2488	Thanks, that's good information. There are actually five tables, as it turns out. Now, the question is, what should this balance check test for? Should it test that the default balancer is working as expected? Or should it test that the outcome fits some general definition of "balanced"? For example, that no server should be more than _n_ standard deviations away from the mean.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2488
16901	ACCUMULO-2467	If the root cause of this ticket is "the website manual needs to be regenerated", then it looks like the 1.4 manual is also impacted. I noticed it doesn't have the client section on the proxy service, which is present in the user manual released for 1.4.4. New ticket? Expand this ticket?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2467
16902	ACCUMULO-2464	[~elserj]: What good is the hash instead of plaintext? At some point, the client software needs the *actual* private credentials, not something computed from them. I don't see how you can work around this, except to integrate with some interactive credential source (direct user prompt) or pass the buck to some other interactive credential source (gnome-keyring-daemon with an interactive prompt for unlocking the keyring, etc.) You could do something like what [Maven does|http://maven.apache.org/guides/mini/guide-encryption.html] to obfuscate passwords with an encrypted version, and put the decryption key in a separate file... but then you have to protect that other file instead of this one, so I don't see much value gained by such obfuscation. At best, it's no better than simply putting the plaintext password in its own file. And, for that, I like the kind of options that openssl provides for specifying a password source (which also formed the motivation for shell password options in ACCUMULO-1412). Something similar to ACCUMULO-1412 could be done for configuration, but essentially, these are all just variations on the same general theme of isolating sensitive configuration to a file and locking down file permissions to the user running the service.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2464
16903	ACCUMULO-2450	[~bhavanki], could you reinstate DeleteRowsTest as a unit test under src/server/src/test/java/org/apache/accumulo/server/master/ ?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2450
16904	ACCUMULO-2445	After using ByteBuffer a bit, I think it is extremely unfriendly to work with. I'm leaning towards something a bit simpler, more like our current ByteSequence. Of course, making it easily convertible to/from ByteBuffer would be helpful, so I'd want to do that. What do you guys think?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2445
16905	ACCUMULO-2439	Hi Joe! Thanks for the contribution. Could you post it to [the Apache review board|https://reviews.apache.org/] so it's easier to gather feedback?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2439
16906	ACCUMULO-2423	bq. How's about we ditch bash for something [...] like python or ruby I can't say I'm opposed to that. Granted, python and ruby would also have their own caveats about the version installed (python 2 to 3 being the biggest but still easy to work around).	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2423
16907	ACCUMULO-2421	Commit 2b3202aee60a92c909d28d6376e73fc4cac1b370 in accumulo's branch refs/heads/master from [~bhavanki] [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=2b3202a] Merge remote-tracking branch 'origin/1.6.0-SNAPSHOT' (for ACCUMULO-2421). Conflicts: core/src/main/java/org/apache/accumulo/core/client/impl/Tables.java	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2421
16908	ACCUMULO-2419	Question for the group: I plan to support specifying the thread pool size for {{SimpleTimer}} (default 1) with a configuration property, but callers of {{getInstance()}}, like {{TabletServer}} and {{Master}}, will need to pass in a configuration object for that to happen. Is it appropriate to update all of those callers within this ticket - say, as a separate commit - or is that better done under a separate ticket?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2419
16909	ACCUMULO-2394	I like the way this looks, but what's the gain over keeping it in ASF CMS directly as markdown? Wouldn't it meet all of the criteria for this issue? We'd have to export it for a release. I'm not sure that's more work than having to push updates out of the main repo to the website.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2394
16910	ACCUMULO-2394	bq. Wouldn't it meet all of the criteria for this issue? Probably -- the ASF CMS is just much more of a pain to work with IMO. It's also not a part of the source tree which I'm not a fan of either (you should get the release notes in the artifact you download just as you do the CHANGES). Thinking some more, it's not a requirement that the release notes are integrated into the main a.a.o website. We could link directly to the release notes content hosted elsewhere (just like CHANGES is now). Exporting isn't a huge concern to me because that's something that isn't difficult to do. Getting release notes in the release artifacts would arguably require just as much work (if not more since it has to be put in tarball, rpms and debs). Overall, I'm not sold on this approach, but I had to the time so I just did it (it literally didn't take more than about 30mins). Jekyll is so much easier to generally use, provides a lot of nice features in building something like this and is easier to get installed. Integration with everything else is a concern.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2394
16911	ACCUMULO-2394	Is this issue done?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2394
16912	ACCUMULO-2380	Commit 7059c767bfbcd2def59556ed63cdfe443f2d336b in accumulo's branch refs/heads/1.4.5-SNAPSHOT from [~bhavanki] [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=7059c76] ACCUMULO-2380 Improve RunTests to produce useful mapper and job output When passed the -m option, run.py for functional tests will emit one line on standard output for each test that passes or fails. The output is suitable for processing when tests are run within a mapreduce job. The mapper for RunTests, which runs functional tests, is updated to pass -m to run.py. It also inserts the map task attempt ID into the custom output, so that testers can trace back any test to the task where it ran, to view its logs for example. The mapper also now uses counters to track the number of successes, failures, errors, etc. Note that since the job may attempt to re-run tests that error out, the total for these counters can exceed the total number of unique tests run.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2380
16913	ACCUMULO-2380	Commit 7059c767bfbcd2def59556ed63cdfe443f2d336b in accumulo's branch refs/heads/1.5.1-SNAPSHOT from [~bhavanki] [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=7059c76] ACCUMULO-2380 Improve RunTests to produce useful mapper and job output When passed the -m option, run.py for functional tests will emit one line on standard output for each test that passes or fails. 16914	ACCUMULO-2380	Commit 7059c767bfbcd2def59556ed63cdfe443f2d336b in accumulo's branch refs/heads/1.6.0-SNAPSHOT from [~bhavanki] [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=7059c76] ACCUMULO-2380 Improve RunTests to produce useful mapper and job output When passed the -m option, run.py for functional tests will emit one line on standard output for each test that passes or fails. The output is suitable for processing when tests are run within a mapreduce job. The mapper for RunTests, which runs functional tests, is updated to pass -m to run.py. It also inserts the map task attempt ID into the custom output, so that testers can trace back any test to the task where it ran, to view its logs for example. The mapper also now uses counters to track the number of successes, failures, errors, etc. Note that since the job may attempt to re-run tests that error out, the total for these counters can exceed the total number of unique tests run.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2380
16915	ACCUMULO-2380	Commit 7059c767bfbcd2def59556ed63cdfe443f2d336b in accumulo's branch refs/heads/master from [~bhavanki] [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=7059c76] ACCUMULO-2380 Improve RunTests to produce useful mapper and job output When passed the -m option, run.py for functional tests will emit one line on standard output for each test that passes or fails. The output is suitable for processing when tests are run within a mapreduce job. The mapper for RunTests, which runs functional tests, is updated to pass -m to run.py. It also inserts the map task attempt ID into the custom output, so that testers can trace back any test to the task where it ran, to view its logs for example. The mapper also now uses counters to track the number of successes, failures, errors, etc. Note that since the job may attempt to re-run tests that error out, the total for these counters can exceed the total number of unique tests run.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2380
16916	ACCUMULO-2378	Commit 389831727a8f6ab2fda98f279a5cba442081ca69 in accumulo's branch refs/heads/1.4.5-SNAPSHOT from [~bhavanki] [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=3898317] ACCUMULO-2378 Replace LOGNAME usage in TestUtils.py with getpass When running functional tests under MapReduce, the LOGNAME environment variable is not available. This change switches TestUtils.py to use getpass.getuser(), which looks for a variety of environment variables to locate the current user, and which works more reliably.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2378
16917	ACCUMULO-2378	Commit 389831727a8f6ab2fda98f279a5cba442081ca69 in accumulo's branch refs/heads/1.5.1-SNAPSHOT from [~bhavanki] [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=3898317] ACCUMULO-2378 Replace LOGNAME usage in TestUtils.py with getpass When running functional tests under MapReduce, the LOGNAME environment variable is not available. This change switches TestUtils.py to use getpass.getuser(), which looks for a variety of environment variables to locate the current user, and which works more reliably.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2378
16918	ACCUMULO-2378	Commit 389831727a8f6ab2fda98f279a5cba442081ca69 in accumulo's branch refs/heads/1.6.0-SNAPSHOT from [~bhavanki] [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=3898317] ACCUMULO-2378 Replace LOGNAME usage in TestUtils.py with getpass When running functional tests under MapReduce, the LOGNAME environment variable is not available. This change switches TestUtils.py to use getpass.getuser(), which looks for a variety of environment variables to locate the current user, and which works more reliably.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2378
16919	ACCUMULO-2378	Commit 389831727a8f6ab2fda98f279a5cba442081ca69 in accumulo's branch refs/heads/master from [~bhavanki] [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=3898317] ACCUMULO-2378 Replace LOGNAME usage in TestUtils.py with getpass When running functional tests under MapReduce, the LOGNAME environment variable is not available. This change switches TestUtils.py to use getpass.getuser(), which looks for a variety of environment variables to locate the current user, and which works more reliably.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2378
16920	ACCUMULO-2375	Please expand the description of this ticket. What do you feel is missing? I often use my IDE to run Accumulo and did not need any particular procedures to get started. Just add the dependency to a pom.xml file and start coding. If you want to run Accumulo in-process, you can use the various test techniques (MockAccumulo, Instamo, etc...).	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2375
16921	ACCUMULO-2368	Can't the walogs be owned by the two new tablets?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2368
16922	ACCUMULO-2365	Is there a single point of contact at Ubuntu who could work with the charm developer and be responsive? I've seen integration efforts fail due to lack of response from vendors. Then the developer's time is simply wasted.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2365
16923	ACCUMULO-2357	Thanks for the explanation [~kturner]. Updates to numRead are not thread-safe. Is that not a concern here?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2357
16924	ACCUMULO-2357	bq. Updates to numRead are not thread-safe. Is that not a concern here? Right, its not. Its not a concern. Its not expected that multiple threads would be reading from the same iterator.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2357
16925	ACCUMULO-2353	Why file the ticket here and not in Hadoop-Common, [~dlmarion]?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2353
16926	ACCUMULO-2353	Looks like this was fixed in Hadoop 2.8. What's the disposition for this ticket?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2353
16927	ACCUMULO-2350	It's difficult to recommend an alternative to something that never had a well-defined behavior. Is that the case here? Did this ever have well-defined (intended) behavior?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2350
16928	ACCUMULO-2350	The case I saw is that {{instance.getConfiguration}} was replaced by {{new ServerConfiguration(instance)}}. If there's ambiguity, can't we still succiently make some sort of recommendation?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2350
16929	ACCUMULO-2350	what in the client API should be using a ServerConfiguration?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2350
16930	ACCUMULO-2349	Where would we log this message to?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2349
16931	ACCUMULO-2349	> http://logging.apache.org/log4j/1.2/faq.html#a3.6 {quote} Is there a way to get log4j to automatically reload a configuration file if it changes? Yes. Both the DOMConfigurator and the PropertyConfigurator support automatic reloading through the configureAndWatch method. See the API documentation for more details. Because the configureAndWatch launches a separate wathdog thread, and because there is no way to stop this thread in log4j 1.2, the configureAndWatch method is unsafe for use in J2EE envrironments where applications are recycled. {quote}	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2349
16932	ACCUMULO-2349	DomConfigurator is already used by the code to accomplish this. I'm still not sure how the current configuration files are a burden on anyone. I rarely even touch them. Given that the current logging configuration mechanism have been like they are now for years, I'm don't view them as such a bad thing. They work a given way, and don't require users to typically touch them. I've also said it once already elsewhere, but you cannot use log4j.properties to configure the log-forwarding as it currently stands as you cannot configure the AsyncAppender with it. Vikram, how are you suggesting that users use the log4j.configuration property to actually configure per-process logging? That sounds like a bunch of new environment variables? Did you have something else in mind?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2349
16933	ACCUMULO-2349	bq. We could also consider that if there is a file called monitor_log4j.properties in conf dir, it means user wants to use it for monitor only. Uhh.. how is that any different than what currently happens?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2349

#	Requirement	Questions	Answered	Successfully Answered	URL
16934	ACCUMULO-2349	[~vines] wrote: {quote}We offer individual configuration for services, how would we offer that with your proposed changes?{quote} Different directories for different configuration, by default, seems sensible to me: {code} /etc/accumulo/ ├── common.conf ├── master	├── java.env	├── log4j.properties	└── master.conf └── tserver ├── java.env ├── log4j.properties └── tserver.conf {code} The actual code should accept these as command-line arguments, though. The directory structure would just be for scripts. A script might look like: {code} # /etc/init.d/accumulo-tserver # ... more SysVInit stuff here CONF_DIR=/etc/accumulo/tserver [-r "${CONF_DIR}/java.env"] && source "${CONF_DIR}/java.env" # java.env contains CLASSPATH= and/or TSERVER_OPTS= lines [-r "${CONF_DIR}/tserver.conf"] && CONFIG="--config ${CONF_DIR}/tserver.conf" java $TSERVER_OPTS org.apache.accumulo.tserver.TServer $CONFIG # ... more stuff here {code}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2349
16935	ACCUMULO-2345	[~vickyuec] avoiding allocation of a Violations Object was intentional. The reasoning was that constraint checking was on the write path for every mutation and want constraint checking to have as little impact as possible when no constraints are violated. I am not sure if this was worthwhile, it does complicate the code. Do you know if this change makes a difference in performance? I wonder if there would be a difference between the versions calling the check function10,000,000 times in a standalone program for mutations that pass,.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2345
16936	ACCUMULO-2345	The patch introduces Mockito, while we already have Easymock available as a dependency. Could you convert the unit test to Easymock for consistency? I'd be fine if this led to a discussion about which framework the project should use, as long as we settle on just one.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2345
16937	ACCUMULO-2338	I am interested in taking this ticket on. Is anyone working on anything related that I should be trying not to conflict with?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2338
16938	ACCUMULO-2336	From an API perspective, one way to do this without changing internal details: {code:java} public class ApplicationTable extends org.apache.accumulo.client.api.Table { public ApplicationTable(String name, Properties applicationMetadata) { super(name); // create new table updateApplicationMetadata(applicationMetadata); } private void updateApplicationMetadata(Properties appData) { /* implementation */ } } {code} This depends on a good, extensible client API with usable Table objects that an application could extend.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2336
16939	ACCUMULO-2314	[~busbey], we were just chatting today about logs containing "DSF". Are these corrections right?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2314
16940	ACCUMULO-2307	bq. MAC flips shit if there ANYTHING in the directory prior. That was by design, later code expects the directories to be empty. Is there a better way to do this? At the very least the odd exception for "ssl" in MAC needs a comment and a constant. It would be best if it could be removed, it just seems like it could cause trouble.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2307
16941	ACCUMULO-2307	[~vines]. Thanks for following up. What precisely is wrong with the current options that MAC already has: the options to set the SSL params in MiniAccumuloConfig, so it can support anything for testing that the full Accumulo supports? The SslIT test that currently exists can simply continue to create temporary keystores in a separate directory with which to test MAC's ssl support against?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2307
16942	ACCUMULO-2300	That's a valid point -- is there a good annotation or some other way to advertise when we've made that conscious decision in certain cases?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2300
16943	ACCUMULO-2299	[~vickyuec], can you add a unit test to assert that an exception is thrown on malformed data?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2299
16944	ACCUMULO-2299	It would be better to use the {{expected}} parameter with the IllegalArgumentException on the JUnit Test annotation instead of the {code} try { do(); fail(); } catch { //pass } {code} The test case you wrote is subject to the serialization of the WholeRowIterator. I would think that it would be cleaner to serialize some key-values, truncate the byte array you pass to the decode method and test for a failure there. Then, you're not encoding serialization logic into your test case. Also, do we want to throw an IllegalArgumentException, or should it just throw an IOException that's already in the method signature? I'm leaning towards the latter at first thought, but I'm not entirely sure.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2299
16945	ACCUMULO-2290	Is the node removal command preferable to using stop-here.sh ?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2290
16946	ACCUMULO-2290	Hi Arshak! How's the work on this ticket coming along? Do you think you'll have something we can review soon? If not, would you mind if we pushed this out to a later release, perhaps aiming for 1.6.1?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2290
16947	ACCUMULO-2287	are you thinking we should modify our scripts to do the rolling OR remove impediments to configuring something like supervisord to do log rolling?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2287
16948	ACCUMULO-2287	How will this impact the accumulo_watcher.sh (ACCUMULO-3569) script?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2287
16949	ACCUMULO-2287	bq. How will this impact the accumulo_watcher.sh (ACCUMULO-3569) script? Reading that script, it appears to perform a loop of "start normally", "wait for it to exit", "check the output". This means that it would not actually perform any rotation of the logs. [~jvines@gmail.com] do you have opinions on the matter?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2287
16950	ACCUMULO-2273	Is there a greater goal here other than library preference?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2273
16951	ACCUMULO-2257	Attached patch where class is moved out. Also added a unit test. Question: Do we need to retain Environment.getAuthorizations? It's not being used anywhere.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2257
16952	ACCUMULO-2257	[~ecn] I wanted to add more unit tests and make code better (e.g. not having public fields getting modified directly). Do you think it's better if I make all these changes in master itself, and then move all classes out once 1.6 is released?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2257
16953	ACCUMULO-2256	What version is this with?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2256
16954	ACCUMULO-2253	Thanks Vikram! Would you mind rebasing against 1.4.5-SNAPSHOT so I can pull this through all the dev branches?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2253
16955	ACCUMULO-2239	Thanks, Alex! I took a quick look: * Can you eliminate trailing whitespace from lines where you find it? * Can you ensure every file ends with a newline? * The markup in the "overwrite previous ingest" commands for test1's README has an error. * Go ahead and place "TBD" or something as the content for test3's README. A follow-on JIRA can be for real content.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2239
16956	ACCUMULO-2229	I don't understand your suggestion. You're saying, keep them in the modules for their components, but they can be included in the output package right there? We don't produce separate packaged artifacts for each component, do we? The particular thing I'm suggesting is unmaveny is stuff like this in assemble/src/main/assemblies/component.xml: {{<directory>../server/tserver/src/main/packaging/etc/init.d</directory>}}. How are you proposing we resolve that? Or are you just saying that you think the cost of attaching it as an artifact outweighs the risk of having inter-sibling, filesystem path-based implied dependencies?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2229
16957	ACCUMULO-2219	Fate operations are executed in a thread pool. The size in configurable by setting master.fate.threadpool.size, it defaults to 4. Operations that do not lock the same table should be able to execute in parallel. If an operation tries to lock a table that already locked, it should yield and not tie up the fate thread. When you say things are backed up, do you know more about what was going on? Did you happen to look the output of the fate admin print command? It shows what operations have locks and are waiting to get locks.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2219

#	Requirement	Questions	Answered	Successfully Answered	URL
16958	ACCUMULO-2212	I was looking back at this, and this new {{o.a.a.server.zookeeper.ZooReaderWriterFactory}} does not appear to be used at all. Is that intended? Is this a bug? Should this class be deleted? Also, the problem originally reported (singleton with public constructor) seems to have shifted to this {{ZooReaderWriterFactory}} class instead of the original {{ZooReaderWriter}}. Since this has already shipped in 1.6.1, I suppose a new issue should be opened to deal with it, but before I do that, I'm kind of curious what the intentions were for this unused class.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2212
16959	ACCUMULO-2204	Do we have any way of verifying that 19 should not exist?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2204
16960	ACCUMULO-2204	bq. Do we have any way of verifying that 19 should not exist? Maybe make the last node point to the first node deleted. Write 19->29 and then delete 19. Its not perfect, but it adds an interesting variation to the test.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2204
16961	ACCUMULO-2180	Can we do this work as a contribution to Presto, then track what the Presto ticket is here? In general, we're trying to get these kinds of connectors baked in to the project that would be connecting. Accumulo's APIs are stable, so said connectors should be able to work across multiple Accumulo versions.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2180
16962	ACCUMULO-2180	I would be interested to know the status of this JIRA. Is this being done or not yet started?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2180
16963	ACCUMULO-2180	I recently read that Presto has no security (i.e. usernames). Did I read that correctly?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2180
16964	ACCUMULO-2180	I can add a blurb to the website when it gets released, [~elserj]. Should it go in {{projects.md}} or some other page?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2180
16965	ACCUMULO-2180	bq. I can add a blurb to the website when it gets released, Josh Elser. Should it go in projects.md or some other page? Awesome. Thanks in advance. That sounds like a good place to me. I'm going to go ahead and close this issue (since it was addressed in Presto, not here in Accumulo) and open an issue to make sure we don't forget about updating the website.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2180
16966	ACCUMULO-2178	[~elserj] If we add ranges for both cf and cq to the new Filter, then the ColumnSliceFilter becomes a special case of the new Filter where cf_start and cf_end are both null. Does that sound correct?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2178
16967	ACCUMULO-2160	Do we really want PasswordToken to return a copy on getPassword()? Will that violate it's "Destroyable"-ness in any way (maybe when it's overridden)? I'm not sure. Just want to make sure we're not doing something we don't want to do. I also wonder how many of these changes can be represented as warnings in Eclipse (or your IDE of choosing) and whether we should make them standards. Eclipse may even support some of these things (like stripping redundant modifiers off interfaces) as save-actions. Also, I noticed that many changes here added trailing whitespace (including indented blank lines). In TestLruBlockCache (perhaps elsewhere also), it should probably have used JUnit's Assert.assertArrayEquals(), for more informative failure messages, rather than assertTrue(Arrays.equals()) It's curious that Math.abs was inline'd into the class. What's the reasoning for that in the examples?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2160
16968	ACCUMULO-2160	Thanks for doing this. I'm a huge Findbugs fan. Some items that jumped out at me: * In several places you switched out {{Math.random()}} for {{Random.nextInt()}}. It may be worthwhile creating a single {{Random}} instance for all code to use, so that there aren't a bunch of them around. The downside is that {{Random}} isn't thread-safe, so a shared instance would have to be synchronized. I'll leave it to you whether that is an issue for performance ({{Math.random()}} had to synchronize anyway). * The change in the {{equals()}} methods of {{Condition}} and {{ConditionalMutation}} mean that their subclasses can now be considered equal to superinstances. That might matter, it might not. * I saw some stubbed {{hashCode()}} methods, which makes sense for this ticket, but we'll need to fix those. * The correction in {{Authorizations.contains(String)}} seems like it could be huge, since before it would always return false. Did that have any impact? * The correction in {{TabletServer.AssignmentHandler.run()}} also seems like it could have some significance in making {{recentlyUnloadedCache}} work better - maybe causing more {{UNLOAD_FAILURE_NOT_SERVING}} messages to be generated. (Looks like a good thing.)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2160
16969	ACCUMULO-2159	I don't think turning on or off is a good idea. What's the root of the issue for you-- that the values aren't human readable when scanning via the shell? That can be helped with the use of a formatter on the table. I think some better (or any, it appears) documentation would be better than getting rid of the value.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2159
16970	ACCUMULO-2149	Is this really a blocker?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2149
16971	ACCUMULO-2149	Would it be sufficient to have the verification MR job look at the job counters to verify that the number of data local map tasks are within some threshold of the total number of launched map tasks? Presumably, for release testing the continuous ingest test and the verification job will run on clusters with a node count >= 5.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2149
16972	ACCUMULO-2149	bq. Would it be sufficient to have the verification MR job look at the job counters to verify that the number of data local map tasks are within some threshold of the total number of launched map tasks? That sounds like a good check. Not as rigorous as I would like, but much better than nothing. If there is a bug in the Accumulo code and its giving the wrong location for a tablet, then M/R would report task as local that are not. For example if Accumulo was giving M/R the last location instead of the current location.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2149
16973	ACCUMULO-2148	I can verify that given a 1.4 instance, 1.6.0-SNAPSHOT properly says "Noooooooope." The error message is the generic "This version of Accumulo doesn't work with the version from your data" from server/base/src/main/java/org/apache/accumulo/server/Accumulo.java {code} if (dataVersion != ServerConstants.DATA_VERSION && dataVersion != ServerConstants.PREV_DATA_VERSION) { throw new RuntimeException("This version of accumulo (" + codeVersion + ") is not compatible with files stored using data version " + dataVersion); } {code} Does this upgrade just need to be manual? Would an upgrade from 1.5.1-rc2 be sufficient?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2148
16974	ACCUMULO-2148	As a part of this, I plan to update the README's section on upgrading. Right now it still gives the 1.4 -> 1.5 instructions. Besides the instructions about Fate that will be added as a part of ACCUMULO-2519, are there any other special considerations?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2148
16975	ACCUMULO-2148	[~elserj], that sounds like something that should be covered in [the user manual chapter on multi volume set ups|https://git-wip-us.apache.org/repos/asf?p=accumulo.git;a=blob;f=docs/src/main/latex/accumulo_user_manual/chapters/multivolume.tex;h=0a0e6fef06fdf8c233ef11b20618c190e2a719c1;hb=refs/heads/1.6.0-SNAPSHOT]. For one thing, I would expect to do such an upgrade in two steps # Upgrade 1.5.x -> 1.6.x and verify # move from single volume to multi volume and verify This looks, to me, like a distinct step unrelated to upgrades. Furthermore, as the user manual chapter points out, multivolume configurations are an advanced option only needed at a particular scale. It's not something we should be calling out in the README for common upgrades. Can you please file a follow on ticket?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2148

#	Requirement	Questions	Answered	Successfully Answered	URL
16976	ACCUMULO-2148	bq. I could maybe explain that the 1.4 to 1.5 upgrade process asynchronously handled migrating 1.4 write ahead logs and that 1.6 can no longer make retries? I think that would be a good idea. Perhaps a disclaimer that those successfully running 1.5 upgraded from 1.4 don't need to perform the verification of no local WALs, too. bq. I did mean "table metadata". We write into multiple tables as a part of the upgrade, not just into the reserved metadata table. (the new reserved root, for example) Oh I see. What about ".. in both ZooKeeper and the Accumulo system tables." instead? That would match nomenclature better I believe.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2148
16977	ACCUMULO-2143	What's the use case we're supporting by exposing any part of the ZooKeeper underpinnings? This smells like abstraction leakage.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2143
16978	ACCUMULO-2143	How is it abstraction leakage? What if I'm running a test and I want to verify the state of ZooKeeper after some operation(s)? (I think) My original intent of this was to keep myself from having to dig into "How do I make a ZooKeeper object from the ZooKeeper connection string". That's the biggest arguing point I see here.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2143
16979	ACCUMULO-2143	bq. (I think) My original intent of this was to keep myself from having to dig into "How do I make a ZooKeeper object from the ZooKeeper connection string". That's the biggest arguing point I see here. That's pretty easy, actually. {{ZooKeeper zk = new ZooKeeper(connectString, timeout, null);}} It's _even easier_ if we use Curator.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2143
16980	ACCUMULO-2143	bq. A MAC we use for Accumulo testing should be a different thing than the MAC we make part of the public API for end users. They have different audiences and maintenance costs (because we constrain ourselves wrt changing our public API). That's my point, they don't have to be separate entities. I don't see the addition of a convenience method on MAC limiting any user from using it to test against Accumulo's APIs. Are you saying that you think this addition should not even be available to a user?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2143
16981	ACCUMULO-2143	Josh, I started it but it wasn't much. It is at home, but something like public ZooKeeper getZookeeper() { return new Zookeeper(config.getZookeepers(), 30000, null); } I thought about creating a Zookeeper object as part of the start, and then having getZookeeper return that. The benefit would be the MAC could handle the close. But it would only be one object. I also thought about making an array of returned Zookeeper objects, one for every call to getZookeeper. This again would allow the MAC to close them on MAC.close. Don't worry about anything I worked on though, it was small.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2143
16982	ACCUMULO-2143	{quote} bq. A MAC we use for Accumulo testing should be a different thing than the MAC we make part of the public API for end users. They have different audiences and maintenance costs (because we constrain ourselves wrt changing our public API). That's my point, they don't have to be separate entities. I don't see the addition of a convenience method on MAC limiting any user from using it to test against Accumulo's APIs. Are you saying that you think this addition should not even be available to a user? {quote} Yes, I'm saying for users of the public API we should not expose this.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2143
16983	ACCUMULO-2143	So what is the current desire for this ticket? 1) Do nothing and close the ticket 2) Do what the ticket originally requests and implement a getZookeeper that returns a Zookeeper object in both the MiniAccumuloCluster (public API) and MiniAccumuloClusterImpl (internal) 3) Only implement getZookeeper to return a Zookeeper object in the MiniAccumuloClusterImpl 4) Something different, I am completely off If it is option 2 or 3, do you want MAC to close any returned Zookeeper objects automatically, or simply document they will need to be closed in the Javadoc? Thanks	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2143
16984	ACCUMULO-2143	Ok, so everyone is good with option 3, but having it return a ZooReaderWriter? Should every call to getZookeeper() return a new object or the same one? I'll see what I can do to close it when the MAC closes. Thanks	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2143
16985	ACCUMULO-2139	[~elserj], I like where you are going with this. The more testing we can automate the better. ACCUMULO-2036 can not easily be tested on a single machine, it requires multiple nodes. Therefore its not a good candidate for a integration test. We need a framework for writing and running test that require a cluster. Does anything like this exist? What about bigtop, does anyone know what it offers? Upgrade testing is a different animal, but I suppose it could be fully automated also. I made a start at this w/ {{test/system/upgrade_test.sh}}, but its not fully automated and its not very exhaustive.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2139
16986	ACCUMULO-2139	bq. The more testing we can automate the better Bingo. bq. What about bigtop, does anyone know what it offers? My (uneducated) presumption was that Bigtop would be more pain than it would be worth for our use of it, but that's a painfully uneducated assertion. I know [~jvines@gmail.com] and [~mdrob] have both done stuff with Bigtop, perhaps they could weigh in on how easy/hard this would be. Ultimately, I don't want to be bogged down with a bunch of other things -- I just want to write my Accumulo test and avoid the situation where I can't test what I want to test due to limitations of the testing harness itself. We want to test Accumulo here, not test Accumulo *and* it's functionality with everything else. Ideally, I'd like to not have to worry about setting up things like Hadoop/ZooKeeper for such a test, but leave them as a pre-req to provide fs.default.name/fs.defaultFS, the zk connection string, and whatever necessary env variables we need to bootstrap Accumulo. I dunno -- if tool exists that provides us what we need without a bunch of other limitations, we should use it.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2139
16987	ACCUMULO-2139	Cool! Thanks for the input, [~mackrorysd]. bq. currently Bigtop needs a "release" before it will build everything for you Is this really just some Maven GAV that can be pulled through Maven or Ivy, or something else? Ultimately, I think you hit the nail on the head with this note. While it would *also* be nice for us to catch changes upstream in ZooKeeper or Hadoop (or even help them find bugs!), I think that's a next step. Step one is really integration testing on semi-stable versions of Hadoop so we can identify if (when) we screwed up. Another thought here is that we could leverage something like Yarn through HOYA to automate the cluster deployment. It took me a while to realize this, but I think there are a few perks. # It aligns with (my) goal of treating Hadoop and ZooKeeper as provided # You can define cluster specifications (2 masters, 8tservers and 64 tracers) # It would run agnostic of *actual* resources available. I think that last point is actually a pretty cool one. As long as your have memory on the NodeManagers to actually service the requests for your cluster (you have enough resources to start each process), the number of nodes is irrelevant. While this may not be satisfactory for some of our tests (such as local mappers), but it still allows anyone to run the tests (we could mark tests that don't have the resources as "incomplete" or "not-applicable" given the resources).	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2139
16988	ACCUMULO-2136	[~vickyuec] - How did you generate this patch? It looks like you used {{git diff}}, so I was able to apply it using {{patch -p1}} but not {{git am}}. Can you create another patch using {{git format-patch}} and upload it? Can you add javadoc to the {{Fate}} constructor to hint to the user about the need to call {{startTransactionRunners(int)}}? Nit: There is trailing whitespace on Fate.java:145. I'll assign the issue to you, thanks for taking this on!	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2136
16989	ACCUMULO-2132	bq. OMG thank you! Ha, you're welcome. Was also going to try to squash the "SCDynamicStore" warnings, but those didn't seem to get picked up like this -- didn't feel like digging into that one as well.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2132

#	Requirement	Questions	Answered	Successfully Answered	URL
16990	ACCUMULO-2126	{{mvn package -Dhadoop.profile=1 && mvn package -Dhadoop.profile=2}} fails, but I think that's unavoidable. Can you strengthen the comment {{+ <!-- Just to denote intention, won't work to activate profile -->}}, since it is now required, in order for the enforcer plug-in to validate? Everything else looks good!	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2126
16991	ACCUMULO-2114	In what way do you propose users interact with this value? The way it is currently implemented is similar to java classes in the default package. That is, the fully qualified table names for tables in the default namespace have no namespace prefix. Namespaces are not really first class citizens, like tables. So, can you clarify how you think this should change?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2114
16992	ACCUMULO-2114	Well, I was thinking that the "default" namespace could be the results of getConnector().namespaceOps().getDefaultNamespace(), and the connector-specific default namespace would be the results of getConnector(namespace).namespaceOps().getDefaultNamespace(). But, I can see how this could be non-intuitive for users to understand the answer to the question: "What is the *default* default namespace?". Alternatively, we could add a separate namespaceOps().getCurrentNamespace() or something. The merits of that can be debated later if we decide to pursue that feature. Other reasons for moving it to namespaceOps(): 1. Constants are harder to find if separated into a separate file, because users don't know to go looking there if they're working with a separate class. 2. Constants files tend to get bloated, which diminishes their value for consumers (although they still have value for refactoring). 3. Encouraging client use of constants, with compile-time binding, means that compiled client code could break if we change the value of the constant.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2114
16993	ACCUMULO-2113	[~jaredwinick] do you have a test that verifies that behavior? shouldn't the different applications be under different classloaders, which would give them different pools?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2113
16994	ACCUMULO-2113	Oof, that is a little brittle. On the other hand though, the best we can do is try to make sure it works in the environments which it was tested. Is the "Thrift Connection Pool Checker" thread name coming from us or from Thrift? This would be good to lift into a constant if we're setting it (probably a note for whomever integrates it into Accumulo).	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2113
16995	ACCUMULO-2113	[~kturner] are you referring to a version that would require changes to the ThriftConnectionPool and ZooSession to make them able to shutdown their resources without these reflection and thread hacks? I wasn't planning on that in the near term, especially if there is a working, albeit ugly, way of cleaning up resources against an unpatched Accumulo 1.5.0. Would this non-reflection version be what actually gets added to 1.4.5, 1.5.1, 1.6.0? FWIW, I tested the example web application on Tomcat 6.0.37 with the same successful results.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2113
16996	ACCUMULO-2107	Is there a way to apply the standards partially to a file without being in Eclipse? I can apply across the whole file outside Eclipse, but that can lead to all sorts of extra edits.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2107
16997	ACCUMULO-2100	Why was the artifact re-versioned to 2.0.0? This could be very confusing if it doesn't match Accumulo's versioning (especially, the major version).	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2100
16998	ACCUMULO-2100	[~elserj] I know we emailed back and forth about this, but now that I have I had a chance to digest it for a while I wanted to open up the discussion again. It seems like the reason for accumulo-instamo-archetype-1.4 and accumulo-instamo-archetype-1.5 etc is because of changes in the API for the MiniAccumuloCluster. For most projects, I would handle this with a wrapper around MiniAccumuloCluster to hid these changes. In fact, I already created a wrapper in some of my testing that extends the MiniAccumuloCluster to override close and clean up the the temp directory. Are the differences between MiniAccumulo version so complex a wrapper wouldn't work? When I think about it from a user perspective, I would want one archetype that allows you specify the version of accumulo to use. Something like {noformat} mvn archetype:generate -Daccumulo.version=1.5.1 {noformat} Two things I don't know if archetypes handle that would be needed 1 - A way to validate optional properties. It would be useful to specify a released version of the archetype supports version A, B and C and throw an error if you tried to use a different accumulo version. 2 - A way to include a specific version of the wrapper based on the accumulo version passed in. To me, here are benefits assuming those 2 items are possible. - Adding support for a new version of Accumulo would be adding new wrapper class instead of creating a new archetype. - It would allow for multiple version of minor release, like 1.4.4 and 1.4.3. I am sure users will stuck at certain releases behind the latest and would want to use the archetype to build new components.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2100
16999	ACCUMULO-2100	Nice -- makes sense. We've had some other discussions about how MAC should evolve. Instead of extending the minicluster itself, might it make more sense to add something new to the MiniAccumuloConfig? The changes you have might be a simple workaround for the short-term, but it would definitely be good to weigh in on the bigger picture for MiniAccumuloCluster (notably, starting a temporary instance, starting a temp instance from a real instance, and other things).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2100
17000	ACCUMULO-2100	bq. might it make more sense to add something new to the MiniAccumuloConfig? I also think this is the way to go. If we want MAC to be able to run out of a directory setup by a previous run, then add an option to MiniAccumuloConfig to support this.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2100
17001	ACCUMULO-2100	Sorry, I meant to answer that as well. I was planning to add a Wrapper to the MiniAccumuloConfig as well to handle the new options. I agree a better long term solution would be to roll this stuff into the MiniAccumuloCluster/Config. Putting a wrapper on both objects in the archetype adds capability for already released versions and would allow new design to be tested. Functionality could be moved to the MAC proper as it made sense. Does this sound reasonable?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2100
17002	ACCUMULO-2097	[~elserj] - can the sqoop connector take care of the brutally simple import use case?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2097
17003	ACCUMULO-2097	bq. can the sqoop connector take care of the brutally simple import use case? I don't know -- I haven't looked at that code yet. My comment was more meant in terms of schema design in Accumulo. Mapping csv data to a big-table database is probably the easiest "schema" for new users to understand.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2097
17004	ACCUMULO-2097	[~elserj] - I'm already working on the CSV/TSV part, even though there is not a JIRA for it yet. Do you want to wait for me to finish that so you can integrate it in, or do you have different plans?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2097
17005	ACCUMULO-2097	bq. I'm already working on the CSV/TSV part, even though there is not a JIRA for it yet. Do you want to wait for me to finish that so you can integrate it in, or do you have different plans? /me facepalm I just worked up a bunch of stuff last night too, haha. I was making something standalone and then going to see how/where it makes sense to merge it in. Lemme push my stuff to Github for now. Edit: https://github.com/joshelser/accumulo-csv I got most of the boilerplate stubbed out last night. I was planning on supporting rfile creation or mutation writing. I also planned to implement a rudimentary schema support to show how the non-fixed colfam set for a table can be used and tracked.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2097
17006	ACCUMULO-2084	Can you explain why clone table, or anything, needs to lock the namespace? Isn't locking on the fully qualified table name sufficient?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2084

#	Requirement	Questions	Answered	Successfully Answered	URL
17007	ACCUMULO-2079	[~mdrob]: This ticket was about adding restrictions to the argument checks to ensure that users don't do bad things to the built-in namespaces. I added those restrictions here, and *additionally* tried to make sure the error message sent back to the client is informative (rather than simply a TApplicationException, which we wrapped as an AccumuloException with no informative message). Perhaps I didn't go far enough, in ensuring these messages were presented well to the client... but that wasn't the primary goal of this ticket. I created a second ticket for that... and I fully back it. What I'm trying to understand by your "-1", is if there's something *bad* about the fix for *this* ticket, or if you're just annoyed it didn't go far enough (all the way back to the client). If it is something bad with *this* ticket, I can fix that here. If it's that it didn't go far enough... then this commit is fine as an incremental improvement, and I (we, whoever) can still do that work under a more tightly scoped ticket (which I created as ACCUMULO-2133). What I mean when I say I'm not forcing users to string parsing to get at the information... I mean that this fix did not attempt to make that current requirement any better. If they had to do that before, they still have to do that now... what I mean is that I did not add any additional requirement to do so, but I still made the improvement to restrict table creation in the system namespace. (Actually, I think I laid the groundwork for the improvements you're talking about in a future commit... it just wasn't done... yet.) The fix here did include documentation updates (minor javadoc), informative error strings, and additional tests... it just wasn't scoped to the API issue you're talking about... it was scoped to the restriction to create tables in namespaces. Certainly these overlap... but in some sense, all of our code overlaps... we have to draw the line somewhere in order to make incremental progress. Does that mean this commit should be reverted, or that it did not add value as an improvement, independent of that issue? In any case, if it's a priority, I can certainly begin work on Monday on ACCUMULO-2133. However, it was my understanding that there was some contention regarding exactly *how* the API changes should happen, and honestly, I'd rather avoid being at the center of that controversy, and just make progress in other areas, rather than throw myself under that particular bus. Either way, API changes or not... this change needed to happen... because we can't have users creating tables in the reserved namespace, or deleting built-in namespaces, etc.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2079
17008	ACCUMULO-2076	What about the new {{public ZooKeeperInstance(Configuration config)}} method introduced in 1.6? This was created for the sole purpose of passing in client side config. accumulo-site.xml contains server side config.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2076
17009	ACCUMULO-2076	Can clients and servers use a different set of zoo keepers? I imagine that those have to be the same between both, right? So what is the distinction between {{accumulo-site.xml}} and a client config at that point?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2076
17010	ACCUMULO-2076	bq. The accumulo-site.xml file used by servers has a secret that client should not see. This has come up a couple of times recently about how the accumulo-site.xml file isn't necessarily good to client consumption. Would it be better to think about how we can split up the logic into client and server xml files and make sure we get make decisions about how to structure said files from a segmentation of configuration params (for server and for public use) and for ease of API use.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2076
17011	ACCUMULO-2076	(Discussion taken from review board.) {quote} [~elserj] wrote: Wait, I just noticed that you have this RB marked as 1.4.5-SNAPSHOT (and your javadoc has @since 1.4.5, etc) but your original ticket is marked for 1.7.0. I do not think this should pushed back to 1.4.5 or 1.5.1. What is your intent? Also, I was just talking to [~bills] about creating Instances earlier by chance. Have you considered expanding this to also support HdfsZooInstance and MiniAccumuloInstance? This would also give us flexibility in (if we move this direction) to having threadsafe and non-threadsafe variants of the aforementioned Instances (also moving towards a fluent interface like [~bhavanki] mentioned). {quote} In theory, I'm fine with any fix version <= 1.7; in practice, I'm writing utilities and applications against 1.4 and 1.5 and I absolutely intend to use this in my own code, even if I have to refactor into an external utility class. Expanding this to HZI and MAI (and MockInstance?) is a good idea. I hadn't implemented those because I consider them relatively trivial after there is something for ZKI, and was more concerned about getting the first one right.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2076
17012	ACCUMULO-2076	Why does this have blocker priority?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2076
17013	ACCUMULO-2061	I do want to note that you are increasing the the configuration complexity for "common" users now. Currently, instance.dfs.uri doesn't need to be specified (and will be pulled out of hdfs-site.xml if on the classpath) which lets me make a new installation by only specifying the HDFS directory I want to use with instance.dfs.dir. Edit: Can I specify a path only in instance.volumes instead of URI which would default to the configuration from hdfs-site (defaultFS, is it?) to maintain backwards compatibility with configurations?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2061
17014	ACCUMULO-2061	Ok, that's what I typically expected when I hear relative paths in the context of 1.6, but when dealing with the configuration of these parameters, it wasn't clear to me. So what exactly needs to be decided here? Is deprecating instance.dfs.dir and instance.dfs.uri definitely what we want to do for 1.6? It looks like instance.volumes defaults to "" presently which doesn't jive with what Christopher said earlier about defaulting to "/accumulo" -- should this be updated? As of now, it looks like the "default" volume is still pulled only from instance.dfs.dir (will error if you try it through instance.volumes) and instance.volumes is used for additional volume definitions.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2061
17015	ACCUMULO-2061	[~elserj] wrote: {quote}So what exactly needs to be decided here?{quote} # instance.dfs.uri is certainly unnecessary outside of upgrades, only needed for resolving the previous relative paths. We can deprecate its use now... no deciding necessary. # instance.dfs.dir is needed to resolve the previous relative paths, but also (currently) as a (in my view) confusing extra element for each volume in instance.volumes... we need to decide if we want it to only be used for resolving the previous relative paths. Do we agree that the extra element adds little value as a separate property and is really only needed to resolve relative paths from previous versions?.... OR... do we think that it's useful to configure a common subdirectory with a separate property and that this warrants keeping the current behavior of joining two properties to make absolute paths? Personally, if we think there's any value in configuring a common subdirectory, i think we can support that feature by adding property interpolation in configuration parsing in the future. Example: {code} subdir = myApplication.accumulo-files instance.volumes = hdfs://nn1/${subdir},hdfs://nn2/${subdir} {code} However, while interpolation is a useful feature... I don't think it's a prerequisite for solidifying the behavior of absolute paths with a single property rather than two.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2061
17016	ACCUMULO-2060	Can the defaults be updated in a follow-on JIRA?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2060
17017	ACCUMULO-2060	bq. Can the defaults be updated in a follow-on JIRA? Hypothetically, but I don't see how that would make sense. I introduced what I consider a bug because now the AccumuloClassLoader is doing something different than what we advertise in the example configurations. Also, these changes were never released.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2060
17018	ACCUMULO-2052	Is this a documentation issue?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2052

#	Requirement	Questions	Answered	Successfully Answered	URL
17019	ACCUMULO-2050	Wow, that's rough -- but, giving some more feedback on the HDFS ticket would probably be good too :P I haven't looked at the viewfs stuff at all yet. It seems excessive to reimplement something whose functionality already (appears) to be in HDFS. Is delaying viewfs for 1.6 and planning for it in a 1.7 timeline reasonable? This might actually be mutually agreeable for a few other reasons (things that didn't make the 1.6 cut).	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2050
17020	ACCUMULO-2039	The patch looks fine. One question for other committers: The patch eliminates a public method in ByteBufferUtil, since it was only used by the code being changed and could be refactored away. Is that elimination OK?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2039
17021	ACCUMULO-2039	ByteBufferUtil is not in our public API, so ti should be fine. We've been known to leak that abstraction, so I'd recommend checking the Accumulo contrib repos to make sure something else isn't impacted. I noticed this defensively copies the actual byte arrays. Do we have some quick way to check for a performance regression on this? I'm not sure how extensively we use getAuthorizationsBB, so I don't know how much overhead we're talking about adding. An alternative would be to use the byte arrays in place but call [asReadOnlyBuffer|http://docs.oracle.com/javase/6/docs/api/java/nio/ByteBuffer.html#asReadOnlyBuffer()] to make sure the generated BB's can't be modified. This won't work if whomever is using the BB needs to grab the underlying byte array, because read only buffer's don't allow access to them (I think Avro's serialization code does this).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2039
17022	ACCUMULO-2015	This patch will create gc/monitor/tracer files when initializing a standalone mode. It will also check for the existence of those files in start-all/here to avoid error messages from grep. Note that this is a change from current behaviour, hence I'm putting it up for review first.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2015
17023	ACCUMULO-2015	"standalone mode" is new to me, but, in my confusion, it looks like the concept doesn't exist in 1.5 or 1.6. Can you explain what standalone mode is supposed to be and why it doesn't exist in newer versions?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2015
17024	ACCUMULO-2015	"standalone mode" was a shortcut to launching a single node Accumulo instance in psuedo-distributed mode invoked by not specifying both the slaves and masters files in $ACCUMULO_HOME/conf. It was in the original code import, so there aren't tickets to look at for its original reasoning. The only [docs I've found for it are comments in the part of config.sh that set it up|https://git-wip-us.apache.org/repos/asf?p=accumulo.git;a=blob;f=bin/config.sh;h=485e259e232cbe0eb99180d1cafd6bc3a8e63488;hb=419aacc45279a3cd6b3b5bf61baf486f082a450a#l97]. AFAICT, it was to make it easier to spin up test instances. [~kturner] removed it from the 1.5.x line in [this commit|https://git-wip-us.apache.org/repos/asf?p=accumulo.git;a=commit;h=4b163a996e090550eb6a29e6d63eb0abb5b5853c] as a part of ACCUMULO-1071 (though I'm not sure if that ticket # was a typo). He would have to speak to what his reasoning was, there's not an explanation on the ticket or mailing lists at the time. If I had to guess, I'd say the presumption was that the addition of bootstrap (and minicluster) obviated the need. Since 1.5.x wasn't required to maintain default behavior, it was just removed instead of wrapped in some option.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-2015
17025	ACCUMULO-2010	When I was working ACCUMULO-1984, I did not see any compiler warnings pertaining to {{Closeable}}. Is this something IDE-specific?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2010
17026	ACCUMULO-2005	I will work on this ticket. Could someone with admin privs assign it to me. Thanks!	1	1	https://issues.apache.org/jira/browse/ACCUMULO-2005
17027	ACCUMULO-2005	The patch applies well to 1.4.5-SNAPSHOT. Unfortunately, argument handling changed substantially in 1.5.x, so the changes won't impact there. Could you checkout 1.5.1-SNAPSHOT and take a look at making your changes work with that version of the code? You'd just add another patch for that branch (e.g. ACCUMULO-2005.v4-1.5.1-SNAPSHOT.patch). If you don't think you'll have time, just drop a note here and we'll get someone to handle it when they have time.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2005
17028	ACCUMULO-2005	Hi Sean, Sorry, I've been late on emails. I've on-site with no internet access until now. Just caught up and saw this. Yes I'd like to go through rebasing exercise myself (to learn), but I probably won't be able to touch this til this weekend. Is that ok? If yes, please show me the steps. Thanks, Hung	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2005
17029	ACCUMULO-2005	Thanks for the contribution [~hpham]. How would you like to be listed on [the contributors page|http://accumulo.apache.org/people.html]? (namely organization and timezone, if either)	1	0	https://issues.apache.org/jira/browse/ACCUMULO-2005
17030	ACCUMULO-1974	[~bhavanki], do you have the capabilities to rebase these changes on master easily? I'm getting failures in applying the patch: {noformat} error: patch failed: core/src/main/java/org/apache/accumulo/core/conf/Property.java:600 error: core/src/main/java/org/apache/accumulo/core/conf/Property.java: patch does not apply {noformat}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1974
17031	ACCUMULO-1960	Made the agitator script a bit more forgiving on how it needs to be run. Also defined an HDFS_USER and ACCUMULO_USER in continuous-env.sh, with them defaulting to the `whoami` in the example. 1) Doesn't require to be run as root, but will change users properly if you do 2) If you run it as yourself, and also run the datanode and accumulo processes as yourself, it won't bother changing users 3) If the user you run the agitator as isn't the same as the user for the process being agitated, the script will try to sudo. If you configured sudo correctly, it should work fine.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1960
17032	ACCUMULO-1957	I was talking offline with [~kturner]. Does anyone have a use-case for wanting to control write durability on the BatchWriter separately from table configuration?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1957
17033	ACCUMULO-1946	Yes, I would assume that it does slow down writes to some extent. I thought briefly about adding a note about this potentially being unnecessary if you're running with UPCs or redundant power supplies, but decided against it. Do [~kturner] or [~ecn] have an idea for the amount of penalty incurred? Looking at HBASE-5954, Lars reported a little under 50% penalty (if I'm reading that correctly, and those numbers didn't change in the end). Personally, I'd much rather warn that they should turn it on, and let someone turn it off if they're comfortable. What do you think about making a note about being able to turn it off when you have more robust hardware power failures? I don't necessarily want to say "we recommend this, but it's going to make it slower". I doesn't seem like the norm to accept data corruption for a relatively small improvement in performance, especially when we think in terms of commodity hardware. Thoughts?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1946
17034	ACCUMULO-1946	bq. Eventually, we may want to have these as table settings, or as mentioned in HBASE-5954, with each update. [~ecn], should we open a ticket? As you mentioned having these for ROOT and METADATA tables sounds important.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1946
17035	ACCUMULO-1946	[~elserj] why not document this in 1.4 also, now that it has hadoop 2 support? Is this config introduced in hadoop 2?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1946
17036	ACCUMULO-1946	What about the following situation, is it relevant? # Compaction occurs writes to file F1 and closes file F1 # Portions of file F1 on 3 datanodes are in memory (OS memory maybe) and not flushed to disk # All 3 datanodes F1 was written to are powered off	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1946
17037	ACCUMULO-1945	I would like to start contributing, could someone assign this to me?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1945
17038	ACCUMULO-1945	Hi Andrew! Could you add "help" to the list of valid commands on the usage line?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1945

#	Requirement	Questions	Answered	Successfully Answered	URL
17039	ACCUMULO-1945	No worries. Patch looks good, I'll apply it this evening. How would you like your name, company, and time zone to appear on the [contributors list|accumulo.apache.org/people.html], if at all?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1945
17040	ACCUMULO-1933	I added this convenience feature for memory units at the same time as the time units, which are definitely SI. So, I guess there's a choice we have to make... do we want to try to stick to SI for everything, or are memory units sufficiently distinct, to support a wider range of (non-fractional) unit declarations? Second, if we do think that memory units are sufficiently different, and to the extent that it makes sense to support the case-insensitive JVM precedent, how do we deal with "b" vs. "B" for bytes? [~ted.m]: since you've expressed a willingness to work on this, what are your thoughts?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1933
17041	ACCUMULO-1933	I don't think I can omit "B" and still be backwards compatible. If I leave "b" as is, then the code errors out currently. Hmm I think I have two options: 1. Support G, M, K, and B in all cases 2. Support G, M, and K in all cases but B only in upper case and add a clean error message for b What do you think. I'm open to both.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1933
17042	ACCUMULO-1933	Thanks Ted! Could you update the new test file to include an ASF license header? A few suggested improvements: * how about IllegalArgumentException instead of generic RuntimeException? * please break the two failure cases into their own tests that use JUnit's expected exception argument to hte Test annotation Also, please make sure you're creating the patch with the "git diff" args given [in our contributor guide|http://accumulo.apache.org/git.html#contributors] so that a committer can easily attribute the commit to you.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1933
17043	ACCUMULO-1933	Thanks Chris, What is the next steps?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1933
17044	ACCUMULO-1933	[~vines] - Thanks for rolling this in. Next time, can you also use the {{--signoff}} option of {{git am}}? It makes it easier to track who is doing what. Thanks!	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1933
17045	ACCUMULO-1910	The source for ./start/src/test/resources/ClassLoaderTestA/Test.jar (and B, C) is below. I have a question about packaging. Because this is a classloader test, was this created as a separate project so that it would not be in the accumulo namespace and is that how it went missing? TestCombinerX,Y are different, I need to check the others, but how do you want these to be packaged? (Stand-alone maven module, or maybe not as a source / class file but just added as a readme?) +++++++++ package test; public class TestObject implements Test { private int count = 0; public String hello() { return "Hello from testA"; } public int add() { return ++count; } }	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1910
17046	ACCUMULO-1910	bq. Because this is a classloader test, was this created as a separate project so that it would not be in the accumulo namespace and is that how it went missing? I'd have to look at the test cases that load these jars, but I don't think they were in their own namespace. I don't think we need to have anything in our source tree for them, but having the source files in the jar with the class file would be nice, IMO. So, a new jar for those which have no source is what I was thinking of. You could attach either the source Java files or a new jar (which contains the source). It's up to you. My gut reaction was that we need source (per ASF policy), but [~billie.rinaldi] pointed out on the mailing list that she doesn't think that to be the case. Regardless, it would be nice for people trying to understand this code to have access to all the source we use to test.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1910
17047	ACCUMULO-1910	[~etcoleman] - Did [~elserj] provide enough guidance, or do you have further questions on this? We'd love to see this submitted and committed.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1910
17048	ACCUMULO-1910	Thanks for the patch, Ed! When you say that the project version is set to 1.4.4, do you mean that the dependency version is set to 1.4.4? Because I don't see anything else that it might be. It looks like it compiled cleanly for me as applied, so I'm not really sure what the problem that you're describing is. After applying the patch and running {{mvn clean package}}, I spot checked {{./src/start/src/test/resources/ClassLoaderTestA/Test.jar}} and {{./src/start/target/test-classes/ClassLoaderTestA/Test.jar}}, and neither one had source. Should I have used a different maven goal to make it work? Minor nit: there is trailing white space in some of the files: {{Test.java}}, {{TestObject.java}}, and some (but not all) of the {{pom.xml}}.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1910
17049	ACCUMULO-1910	Yea... I think we're making this complicated for the sake of preserving compatibility in something that isn't part of the public API anyway. I strongly encourage the shortest path solution here, as the code was never _functionally_ wrong, just a slight bit opaque. Like [~elserj] alluded to earlier, a binary patch of swapping out one jar for another would likely have been sufficient. I added {{src/test-jars-src}} as another module to the main {{pom.xml}} and then saw the artifacts get built. I think it would be easiest for new users to grok fewer jars, since the source files will exist in the tree anyway, but feel free to disagree. My main concern at this point is making sure that the jars we are generating are the ones getting used by our tests, which I'm not convinced is the case right now. Can you create a new JIRA for the doc-gen issues that you are running into?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1910
17050	ACCUMULO-1910	I have no problem with just putting the jars into a patch. However, are there any issues with the manifest? Maven seems to insist that some of my info leak in - no problem with that if everyone is okay with it. With the current patch, it could be built on the jenkis server and then have only accumulo build artifacts. - (Seems cleaner to me.) Alternately, I could modify the build on my end, but sometimes it seems than me and maven are not the best of friends (i.e. suggestions more than welcome,) Or I could ditch maven and just jar cvf ... as long as no one wants to replicate the build...	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1910
17051	ACCUMULO-1907	[~ctubbsii] Seems like moving tables between namespaces could be a nice feature. For example a table could be created in one namespace and then "published" by moving it to another namespace. What are some examples of configuration changes that can cause a problem in table migration, and can we possibly address this by documentation?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1907
17052	ACCUMULO-1904	How would this simplify the API? Can you detail the use case(s)?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1904
17053	ACCUMULO-1904	Can the priority be lowered?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1904
17054	ACCUMULO-1904	[~medined] wrote: bq. How would this simplify the API? It would simplify the API by reducing the need to have all the convenience methods for creating a new table with pre-configured settings. If you could create the table initialized to an offline state, you could use the normal API to configure it before you brought it online. That simplifies a lot of the overloaded createTable cruft.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1904
17055	ACCUMULO-1898	I'm not sure if this aligns with what's been done >=1.5.0 as the NameNode information was removed from the monitor. What kind of confirmation are you looking for? Isn't authenticating with Accumulo (via the shell, for example) validation that your authentication system is working? I'm not a kerberos expert, but it seems like this would a post-installation check and not something I'd want/need to know as I continue to use the installation. Are you looking for the equivalent of "Security is OFF" for Accumulo as exists on the NN UI?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1898

#	Requirement	Questions	Answered	Successfully Answered	URL
17056	ACCUMULO-1898	There should be. Accumulo kerberos integration uses org.apache.hadoop.security.UserGroupInformation#loginUserFromKeytab which has {code} LOG.info("Login successful for user " + keytabPrincipal + " using keytab file " + keytabFile);{code} Check your log4j settings to make sure it's not be squelched?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1898
17057	ACCUMULO-1888	Commit 0e63755d5e3a9e441bae51d2f28402a3768820dc in branch refs/heads/1.6.0-SNAPSHOT from [~ecn] [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=0e63755] ACCUMULO-1831 ACCUMULO-1888 use uuids to confirm WALog GC; remove WALog entries in the !METADATA table with the correct mutation	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1888
17058	ACCUMULO-1869	Hi [~busbey], the issue has been associated with the test component. Is that valid also for others modules? I mean, the others src/test/resources/log4j.properties?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1869
17059	ACCUMULO-1856	Would this be using the [metrics2 stuff from Hadoop Common|http://hadoop.apache.org/docs/stable/api/org/apache/hadoop/metrics2/package-summary.html] within Accumulo so we can then use the Ganglia integration from there? or just trying to do something similar to the Ganglia provider itself? (I'd prefer the former, but it means adding a dep on hadoop-common)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1856
17060	ACCUMULO-1853	Right, I'm not surprised. Something is wrong... can you jstack the processes and see where things are stopped (like I did over in ACCUMULO-1861)? If you want to post your logs, I can take a look.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1853
17061	ACCUMULO-1853	I noticed that. Will it be given more memory if I increase the maven opts? What do you set yours to?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1853
17062	ACCUMULO-1853	Is this done?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1853
17063	ACCUMULO-1834	Whatever the rules, I think they should complement the rules for committing patches submitted to JIRA. The more rigorous the rules for RB end up, the less they should be for patches submitted after review, so that committers don't have to exert the same effort twice. If a patch doesn't go through RB, it should face more scrutiny before commit. The Apache voting rules say 3 +1s for a code mod, but that seems high. I like 1 or 2 ship-its. Maybe if it gets only 1, the patch committer must not be the 1 ship-it. What changes don't need to go through RB? Documentation? Commenting?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1834
17064	ACCUMULO-1833	[~cmccubbin] I've been playing around with this. Can you give any insight into the type of workload you were running when you saw this? Even distribution of mutations across many tables? Many to one table and few to many tables? How many threads is "multiple"?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1833
17065	ACCUMULO-1833	I did a plain test of ZooCache and it seemed okay. So now I'm wondering if the issue is related to the way this code gets the ZooCache. It's ultimately reusing the same ZooCache, but it goes through some hoops to retrieve it each time. Could you try out something like the attached patch and let us know if it has any effect on performance?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1833
17066	ACCUMULO-1833	bq. A simple way to avoid this extra work would be to make the cache in MultiTableBatchWriter use table names instead of table ids (the lookup in the cache could be done immediately and if a hash map was used would have constant time cost). But that change in behavior could break any existing code that relies on the current late binding of the table name to table id. Since the late binding is eventually consistent anyway, can't we make a time-sensitive cache (i.e. hold on to things for 5 seconds) that maintains the same semantics and still fixes this performance issue?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1833
17067	ACCUMULO-1833	bq. Since the late binding is eventually consistent anyway, can't we make a time-sensitive cache (i.e. hold on to things for 5 seconds) that maintains the same semantics and still fixes this performance issue? That would at least alleviate the lock contention on ZooCache, but that's really just pushing the problem down a little farther. Perhaps it would push it far enough that clients would see it until they're at 100+ threads in one JVM? That'd probably be sufficient for a fix to this ticket. Digging through the code made it relatively apparent to me that there was a design decision that one ZooKeeperInstance (and Connectors from that Instance) will share a cache on top of ZK. If we want to talk about making changes to let the API be accessed more concurrently within one VM, I think we'd want to start at that point rather than try to address it at every usage of the caching.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1833
17068	ACCUMULO-1833	bq. can't we make a time-sensitive cache (i.e. hold on to things for 5 seconds) that maintains the same semantics and still fixes this performance issue? That sounds good. Would need to ensure time going backwards is handled properly (just drop the cache entry). A "small" timeout could be determined empirically. If this approach looks promising, this should be marked a bug (it fixes a performance problem and does not change behavior or API) and fixed in earlier releases.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1833
17069	ACCUMULO-1833	There's always Guava's cache which has a time-based expiration policy (http://docs.guava-libraries.googlecode.com/git/javadoc/com/google/common/cache/CacheBuilder.html). bq. Would need to ensure time going backwards is handled properly (just drop the cache entry). I was just thinking about a per-VM cache (at which point we only have to worry about the system clock drastically changing). Are you considering something larger than that?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1833
17070	ACCUMULO-1833	bq. Are you considering something larger than that? Nope, just wanted to handle the system clock jumping backwards. Hopefully Guava's cache would handle this.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1833
17071	ACCUMULO-1833	bq. Nope, just wanted to handle the system clock jumping backwards. Hopefully Guava's cache would handle this. Ok, cool. I'll try to get to this today. I'll try to peek at the implementation again, but I think it handles this ok. Should this go in 1.6.0 or >=1.6.1? I figured I'd put it in 1.5.1 either way.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1833
17072	ACCUMULO-1833	bq. Should this go in 1.6.0 or >=1.6.1? I think its a performance bug fix and should go in 1.6.0.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1833
17073	ACCUMULO-1833	bq. Should this go in 1.6.0 or >=1.6.1? I figured I'd put it in 1.5.1 either way. 1.5.1, 1.6.1, and 1.7.0 seem like the best option to me. I don't want to see 1.6.0 get held up and we've already drawn the line in the sand last week.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1833
17074	ACCUMULO-1833	I consider this a non-critical performance bug, and should be handled in a future release, whether it's all bugfix releases or just 1.7.0, I could go either way. If we do decide on bugfix releases and it's done this week, maybe I'll look the other way, provided it doesn't introduce any crazy issues. Is there a randomwalk test that uses the MTBW?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1833
17075	ACCUMULO-1833	Ok, I'll be pushing some changes shortly to address Table cache invalidation. One thing that worries me (not sure if it should), but using an AtomicInteger *does* introduce the possibility of int overflow in a long-running process. Should we care about this? Is using an AtomicLong better? Thoughts on how best to work around that?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1833
17076	ACCUMULO-1833	bq. I would be happier with an AtomicLong or supporting rolling Done. [~kturner] and/or [~ecn], can you look at these changes before I merge them into 1.5.1-SNAPSHOT? They're in the branch ACCUMULO-1833-caching.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1833

#	Requirement	Questions	Answered	Successfully Answered	URL
17077	ACCUMULO-1832	Is this truly a blocker for 1.6.0?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1832
17078	ACCUMULO-1832	How would you be in the same boat? This is a unique problem because of the fact that 1.6 stores full URIs, whereas 1.5 and earlier only stored relative paths. You could replace the namenode with a backup on a different server and things would just work (in theory, anyway).	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1832
17079	ACCUMULO-1832	I like the idea of using a prefix (see [1]) instead of full URL. If there were a mapping of prefix to namenode address in the configuration, would that make rename operations simpler? It's like viewfs to some degree, but I think it allows greater flexibility in the long run as viewfs is limited to directories. In another release when we have a pluggable file placement strategy, then we could add weights or priority to the different prefixes. [1] https://issues.apache.org/jira/browse/ACCUMULO-118?focusedCommentId=13245562&page=com.atlassian.jira.plugin.system.issuetabpanels:comment-tabpanel#comment-13245562	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1832
17080	ACCUMULO-1831	This should be governed by {{master.recovery.max.age}}. That is, we don't really GC recovery files, we just remove them when they have been sitting there for an hour (by default). Did you set this to some very low value?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1831
17081	ACCUMULO-1829	Bump. Could someone commit this? the follow on for docs (ACCUMULO-1835) is already in the 1.4.x branch claiming -f works.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1829
17082	ACCUMULO-1826	Thanks for keeping me honest, I was mainly just spitballing for the name. "accumulo version" or "accumulo about" or whatever sound just as reasonable to me. Don't they say that naming things is one of the hardest parts of computer science?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1826
17083	ACCUMULO-1826	I didn't find how to get all those using pure Java. Do you think it is a good idea to spin up a bunch of processes for the extra information? I guess we can just read some stuff out of {{/proc}} but I am super not-excited about hand parsing any of it.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1826
17084	ACCUMULO-1824	Is this a documentation wish-list item that you'd like to see included somewhere? I'm not sure I understand the scope of this issue, aside from general frustration that may be had.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1824
17085	ACCUMULO-1824	Here's a [ticket | https://issues.apache.org/jira/browse/HBASE-5754] I posted to HBase's mailing list. I tried to include every detail I could think of so they could reproduce the problem: * versions of everything * reproducible, executable test case * documented strangeness: no problem at a million entries, more problems at a billion * multiple tests performed * feedback... I responded to the ticket with more information Is every user going to be able to do this? No. But most users can provide feedback, and logs. Perhaps the fix is something like: {noformat} $ ./bin/accumulo issue Please angryuser, describe what made you want to post a new issue? Describe, what unexpected behavior you first noticed: > shell is hung, can't scan my xyzzy table Accumulo 1.6.0-SNAPSHOT version abc12134... on hadoop 2.2.0, zookeeeper 3.4.0, ... you appear to have 3 node system, with 1.2G of debugging logs. I can deliver this to [dev@accumulo.apache.org]. Y/n? : y Note that the logs often contain small details about the data you are storing. If this is not a test system, we recommend not sending the logs. Do you want to send your logs? N/y? y {noformat}	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1824
17086	ACCUMULO-1817	Would this be using the [metrics2 stuff from Hadoop Common|http://hadoop.apache.org/docs/stable/api/org/apache/hadoop/metrics2/package-summary.html] within Accumulo so we can then use the Ganglia integration from there? or just trying to do something similar to the Ganglia provider itself? (I'd prefer the former, but it means adding a dep on hadoop-common)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1817
17087	ACCUMULO-1817	What's the level of effort for supporting both the new way and the old way with a scary warning message?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1817
17088	ACCUMULO-1817	bq. What's the level of effort for supporting both the new way and the old way with a scary warning message? That's a good question -- I haven't stumbled across anything that would allow for programmatic configuration of Metrics2 as a way to support the old mechanism. I'll poke a little bit, but my gut reaction is that it would be higher than I'd want to do :)	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1817
17089	ACCUMULO-1806	Is this a dup of ACCUMULO-1658?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1806
17090	ACCUMULO-1804	Have a tar.gz need to upload..need to cancel	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1804
17091	ACCUMULO-1804	[~aarongmldt], thanks for the code! Digging through some of the source, it looks like you used the C++ interface for the Thrift proxy to connect R with Accumulo. That, combined with some of the API calls, it looks like raccumulo requires at least Accumulo 1.5.0 and an instance of the Thrift proxy running. Is that correct? It's been quite a while since I've used R; where do you see this fitting into the Accumulo community? Generally speaking, we have two avenues which integration code like this falls into. # Inclusion in core Accumulo codebase # A "contrib" project of Accumulo For #1, this would typically require a committer to sign up to ensure that the code is well-maintained as Accumulo itself grows. It is held to a certain level of testing and has a good expectation of working as expected since it would be released with Accumulo itself. For #2, a contrib project is a means for Accumulo to keep related, developed code near Accumulo. These projects typically follow their own schedule and aren't crucial to a release of Accumulo itself. To me, it seems like a contrib project is the best location for it at the moment. What do you think? Other committers? Do you intend to maintain and add additional functionality to raccumulo as people use it and find bugs or improvements? Thanks again. It's awesome to see contributions like this!	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1804
17092	ACCUMULO-1804	I love teh idea of this contribution, but I'm -1 (non-binding) on the pull request, because it places it in the main project repo. I'd like to see this in a contrib repository. That will take a ticket to INFRA to make a repo, and one of the Accumulo committers will have to do it. The current process for getting a new contrib in Accumulo is just an email to dev@ to get consensus on taking things on. Part of that discussion is the relative merit of having this as a contrib versus having it live in github. Aaron, I see you sent a brief message a few days ago to user@ about this. Could you (or Phil?) copy dev@ into that thread with a brief description of the motivation for adding it as a contrib? Aaron, could you please post your request to [Apache's review board|https://reviews.apache.org/] so that we can provide feedback via an Apache system?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1804
17093	ACCUMULO-1804	[~ctubbsii] Oh, I didn't event think about that. Good point. Do you remember what the ASF rules for non-ASF licensed code is? Can we even place this as a contrib if we wanted to? If it's a contrib, isn't it also subject to our release process as well (which the GPL would throw a wrench into)?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1804
17094	ACCUMULO-1804	I installed R on an Ubuntu virtual machine. Then I installed RStudio and was able to run R scripts through my host browser. Then I downloaded the attached gz file. When I un'tarred the file, I saw no README or other indications how I should install or configure. What did I miss?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1804
17095	ACCUMULO-1804	This thread has started me on the path to create a Vagrantfile to run R and RStudio in a VM. Would you be interested in helping to extend that Vagrantfile to add the integration steps? Then we'd have a one step approach to see this integration working.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1804
17096	ACCUMULO-1802	[~afuchs], could you break those into separate tickets?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1802
17097	ACCUMULO-1801	What's the difference between this iterator and a stack that consists of a column family filter for the projection columns + the predicate input columns, the user predicate, and a column family filter for the projection columns?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1801

#	Requirement	Questions	Answered	Successfully Answered	URL
17098	ACCUMULO-1797	So in that case we just update the release notes to include some notion of how people should report said tests? Maybe as a part of casting a vote on the release? Should we still then require that at least one of the test runs be against each of the hadoop.profile versions (e.g. 2.0, 0.20)? Just to ensure we have some level of confidence when we say things like "works on Hadoop 2" ?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1797
17099	ACCUMULO-1797	bq. Should we still then require that at least one of the test runs be against each of the hadoop.profile versions (e.g. 2.0, 0.20)? I would veto a release that does not run through all of the test on at least one version of Hadoop and Zookeeper. This should shake out most pure Accumulo bugs. It would be nice to find and fix as many integration bugs as possible before release, but realistically we can only require what will actually be done. So what versions should we test (0.20, 1.2, 2.0,?) and who will test? I can run test against at least one version.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1797
17100	ACCUMULO-1797	Okay, then in the interests of not backing ourselves into a corner, we'll document that having a hadoop.profile doesn't imply that a release is officially supported against that profile. Instead the update to the release process will only require that the test set is run against whatever the default profile is? And then whichever versions come in with the release votes make up the supported set for the release? Or are all versions outside of the default profile just informational?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1797
17101	ACCUMULO-1797	When I said veto earlier, what I meant was "vote -1". bq. we'll document that having a hadoop.profile doesn't imply that a release is officially supported against that profile. Does "officially supported" == "we ran our test suite against a version and documented anything special"? bq. whichever versions come in with the release votes make up the supported set for the release? That sounds reasonable, assuming the reporter did not have to take an undocumented step to make the test run.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1797
17102	ACCUMULO-1797	bq. Perhaps making a more discrete testing plan for committers to follow on their "flavors of choice" (OS and Java, Hadoop, Zookeeper versions) would get committers more involved? Are you looking for something more than the testion section on the [relase page|http://accumulo.apache.org/governance/releasing.html]? If so I would be happy to provide more detail. bq. First off, I think that we should be testing Accumulo against each "stable" version of Hadoop at the time of that release – so, for 1.6.0, this equates to 1.2.1 and 2.2.0. I would love for release testing against 1.2.1 and 2.2.0 to be done, I am not against testing on multiple versions. Below are my thoughts : * Doing release testing takes a lot of time, If only one person decides to do this I don't its fair for the community to require anything of them. The community should be thankful for their contribution. I hope more people do release testing and I will be happy to help anyone who wants to tackle it. I suppose another way of looking at it, is that if we do require it then it may force someone to take it on inorder to get a release out? In the case that no one does this, then what do we do? * Whatever release testing we do should be documented. We have not really done this in the past. I think this information would be very useful. There was earlier discussion we were having where we trying to decide if it was ok to support one commercial flavor of Hadoop and not another. In this thread [~benson_basis] advised that we have the option to take whatever is contributed. If code, documentation, etc are contributed to support X and Y, but not Z then thats what we have. There is no need to wait for someone to contribute code and documentation for Z. Also we do not need to drop support for X and Y because no one contributed anything for Z.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1797
17103	ACCUMULO-1797	bq. Are you looking for something more than the testion section on the relase page? If so I would be happy to provide more detail. Nice, I actually didn't know that existed. There's a bit more we could write down in terms of "running functional tests" and how to invoke findbugs/pmd, but those are likely better suited as their own write-ups. In regards to testing on multiple versions of Hadoop, I'm happy to help out (if this wasn't painfully obvious already). The only limitation I see is, given that write-up, people sitting at home aren't going to be able to run the tests on a cluster. They might be able to run continuous-ingest/randomwalk, but that's a pretty low bar of catching bugs that I would expect to have been caught already by unit tests. Along the same lines of what Benson said, we test what we have cycles to or people volunteer to test, and that's what we have. We just need to make sure we meet the bar we've set in that release guidelines for the project.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1797
17104	ACCUMULO-1797	Bump. Can a committer take a look at this please?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1797
17105	ACCUMULO-1797	the PGP v GPG distinction isn't part of this change, it's the original text. Can we do that bit in a follow on?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1797
17106	ACCUMULO-1797	{quote}the PGP v GPG distinction isn't part of this change, it's the original text. Can we do that bit in a follow on?{quote} Sure... and, it's not that important. I had gotten a little confused between the dashes for the patch and the markdown syntax.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1797
17107	ACCUMULO-1796	Does the same problem happen with 1.5.x compiled with the Hadoop 1 profile and run on a Hadoop 2.2.0 cluster? If it does, I'd be much more inclined to do option #3. One of the complications with option #2 is that we don't appear to be doing it for any other of our releases, so it'll have more unknowns.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1796
17108	ACCUMULO-1796	I saw the patch on ReviewBoard. Do you have this patch as a git formatted patch?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1796
17109	ACCUMULO-1794	[~busbey] looking at the RB for this, the only thing still open is our discussion about reworking the agitator.pl to sync up with your changes here. Are you happy with the state up on RB, and then we can open a new issue to track reworking the (current) agitator? One thing I will note after ACCUMULO-1960, it is likely going to be desired that the script be smart enough to handle the case where a single user is running all components in the stack and not force them to start the agitator as root.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1794
17110	ACCUMULO-1794	Just applied locally and did a little bit of testing on 1.5.1 -- Overall looks good to me, but I did think of a couple of things that I'd like to see eventually (or at least get some feedback on the ideas). # Alternate between using haadmin and {{kill -9}}'ing the Namenode. We shouldn't see a difference here, but it would be nice to test coordinated failover and automatic failover # Some more validation before anything else: Can the user sudo to the hdfs admin user as they claim? Do the executables (hdfs, sudo) exist? Does the namespace provided exist (or can we find any namespaces if we're using all of them)? Can we find namenodes for the namespaces configured? The only other thing I'm curious about is when the script tries to choose an random namenode to make active, could we ever get in that block while ZFKC is in the middle of transition? In other words, is it possible to have no active namenodes while automatic failover is happening and we get an error because we try to force the transition?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1794

#	Requirement	Questions	Answered	Successfully Answered	URL
17111	ACCUMULO-1794	bq. 1. Alternate between using haadmin and kill -9'ing the Namenode. We shouldn't see a difference here, but it would be nice to test coordinated failover and automatic failover As I mentioned to [~kturner] in the review, doing this will require a heuristic. We can ask the HDSF admin tools for the hostname corresponding to the namenode id, but picking out the namenode process will be version dependent. I think he and I agreed that that sort of thing was better left to something like BigTop, since it attempts to work across projects. bq. 2. Some more validation before anything else: Can the user sudo to the hdfs admin user as they claim? opened as ACCUMULO-1982 about using sudo to users generally. bq. Do the executables (hdfs, sudo) exist? The existing tests for executability should cover this, no? Or are you looking for more specific error messages? bq. Does the namespace provided exist (or can we find any namespaces if we're using all of them)? Both of these cases are handled by the current error checking. the error message for the former is confusing (the message complains of a missing configuration value). bq. Can we find namenodes for the namespaces configured? This is covered in the current error handling. bq. The only other thing I'm curious about is when the script tries to choose an random namenode to make active, could we ever get in that block while ZFKC is in the middle of transition? In other words, is it possible to have no active namenodes while automatic failover is happening and we get an error because we try to force the transition? Yes, this is certainly possible. As things currently are, we'll simply log a message that this happened and try again the next time around. I couldn't think of anything else worth doing in that case. Note that it's also possible for an automatic failover to have changed which namenode is active while we are in the block that says to use the failover command. In that case, if there are only 2 namenodes we'll just do a no-op failover that says everything went fine. If Hadoop adds more than 2 namenodes per nameservice in the future, then I don't know what it will do but I know we'll log it and try again later. :)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1794
17112	ACCUMULO-1793	I don't think the merge to 1.5.1-SNAPSHOT worked as intended. I'm still seeing 2.0.4-alpha as the dependency in the top-level pom.xml Actually, I'm really confused now. The hadoop-1.0 profile in 1.4.5-SNAPSHOT now activates 0.20.203.0? Also, it looks like we also need to update the default hadoop dependency from 1.0.4 to 1.2.1? It was my understanding that 1.4 was going to keep the default 0.20.* hadoop dependency, and then it would make sense to have profiles that will automatically compile against 1.2.1 and 2.2.0. Did I miss discussion on this?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1793
17113	ACCUMULO-1793	Right, but the hadoop-1.0 profile sets hadoop.version=0.20.203.0. Is 0.20.x binary compatible with hadoop-1? It just seems really weird to me that hadoop-1.0 uses a 0.20. And yes, I think 1.4 should also depend against 1.2.1 when using a hadoop-1 profile to maintain consistency across our other active branches. I had assumed neither hadoop-1.0 nor hadoop-2.0 profiles would be active by default. I can help here if you want/like.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1793
17114	ACCUMULO-1793	[~elserj], Hadoop 0.20 is part of the Hadoop 1.0 line. Since our examples in the README showed building against 0.23 by specifying the hadoop 2 profile and the version (and 0.23 is part of the Hadoop 2 lineage), it didn't seem odd me to have 1.4.x default the Hadoop 1 line to 0.20. But I'm pretty used to Hadoop versions being terrible at this point. The binaries built against 0.20.203.0 should be binary compatible with the Hadoop 1.x releases, but should not be binary compatible with the 2.x releases. Similarly, the binaries built against 2.2.0 won't be compatible with Hadoop 1.x releases (including 0.20.203.0). Unless we backport (or create) some fancy shim work under ACCUMULO-1796. Which part feels glued on? Having a third profile? Since 0.20 is a Hadoop 1 version, I'm not sure that we need to. If it makes the insanity of Hadoop versions easier to follow, I don't think it hurts. We could just change the name of the Hadoop 1 profile to Hadoop-0.20 and not have 1.4 speak to 1.x. As an aside, I think the patch would be better suited to ACCUMULO-1795 since that's the ticket that deals with building against 0.20.203 and non-Hadoop 2 compat.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1793
17115	ACCUMULO-1793	bq. Hadoop 0.20 is part of the Hadoop 1.0 line Blarg. Ok, this is just me being stupid. Blah blah, old hadoop versioning, blah blah. bq. Which part feels glued on? So, when we released 1.5, we started this practice of having the hadoop-1 and hadoop-2 profile which compiled against "good" versions of Hadoop for each line (read as: most recent "stable-ish"). Presently in 1.5 and beyond, this gives us hadoop-1->1.2.1 and hadoop-2->2.2.0. With the introduction of these profiles back in the 1.4 series, which previously only knew about 0.20.203.0, it's the same but different. Suddenly, if someone knows what we do in almost two major releases (1.5 and 1.6), and perform the same action (-Dhadoop.profile=1.0), they aren't going to compile against 1.2.1. It just doesn't sit right to me for 1) the 5th point release to suddenly have different build action than the previous 4, and 2) equivalently named build actions that do different things. That being said, I'm not even sure I like the patch I attached here to clarify things (pretty much why I didn't just commit it). I'm not sure what would be best. Like you said, with hadoop-0.20 being a part of "hadoop 1", but the "hadoop 1" profile using a version of hadoop in the 1.x series in 1.5, we're going to stomp on some approach we previously took. I haven't come up with anything that seems more straightforward yet.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1793
17116	ACCUMULO-1792	What's the reasoning for backporting ACCUMULO-600 as part of this?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1792
17117	ACCUMULO-1792	Just that the discussion around it was in favor and removing it during this set of backports meant I didn't have to figure out getting the version left behind in 1.4 to run on Hadoop 2. Prefer it broken out?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1792
17118	ACCUMULO-1792	Could you specify what concerns you have back on [the thread discussing wikisearch in 1.4|http://mail-archives.apache.org/mod_mbox/accumulo-dev/201310.mbox/%3CCAGHyZ6Lw1W%2BWKO%3DN9yyxcRT2M_Y5UqXVTBFgf1UwX2c06y49-w%40mail.gmail.com%3E]? Our public api declaration is pretty specific about where people can rely on things not changing. FWIW, There is work to get wikisearch under 1.4 working on hadoop 2. A quick glance at the current contrib repo looks like it's find for Hadoop 2. It seems silly to backport those changes, particularly if the contrib repo works with a 1.4 cluster (which is the ask from Keith that I mentioned needing to answer).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1792
17119	ACCUMULO-1792	[~ecn], did you clean up your working directory before building? The line that is failing references o.a.a.core.Constants.METADATA_TABLET_COLUMN_FAMILY. That field exists in 1.4.x, but does not in 1.6.0-SNAPSHOT+. So it looks like your classpath is getting a 1.6.x version of that file and a 1.4.x version of o.a.a.server.util.Initialize. Could you try running `git clean -xdf` and then rebuilding and rerunning? Also note that as of the patch attached, building requires specifying both the hadoop profile and the hadoop version: {code} $> mvn -Dhadoop.profile=2.0 -Dhadoop.version=2.2.0 clean package && mvn -Dhadoop.profile=2.0 -Dhadoop.version=2.2.0 assembly:single -N {code}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1792
17120	ACCUMULO-1789	What did you change the timeouts to?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1789
17121	ACCUMULO-1789	How do I apply the scaling factor to the tests in 1.6, since they're not python based anymore?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1789

#	Requirement	Questions	Answered	Successfully Answered	URL
17122	ACCUMULO-1787	[~kturner] showed interest in this ticket. If you also think there is still interest, can you re-open? I can create a compaction strategy that supports both compression types.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1787
17123	ACCUMULO-1787	What release is this slated for?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1787
17124	ACCUMULO-1785	Bump. Could a committer take a look at pushing this?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1785
17125	ACCUMULO-1785	What branch is this patch applicable to?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1785
17126	ACCUMULO-1785	[~busbey] I applied the patch. There were merge conflicts when applying to 1.4.5-SNAPSHOT which I resolved. When I merged it into 1.5.1-SNAPSHOT there were also merge conflicts which I resolved. It merged cleanly from 1.5 to 1.6. Can you check the 1.4 and 1.5 conflict resolution?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1785
17127	ACCUMULO-1785	I just noticed that these changes also impacted how ACCUMULO_HOME is used. I'm not sure if it was intentional or not. Before these changes, bin/config.sh *always* calculated ACCUMULO_HOME based on the location of itself (config.sh). Since the changes for this issue, ACCUMULO_HOME is only calculated, when ACCUMULO_HOME is not already set or is set to the empty string. From an error-catching perspective, should we add something that does some validation of the provided ACCUMULO_HOME when we don't calculate it? I can easily see cases where the user mistypes an export of ACCUMULO_HOME or programmatically generates an incorrect path and suddenly none of the classpaths work.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1785
17128	ACCUMULO-1785	That was an intentional change. Can we file a follow on ticket for the verification of a set ACCUMULO_HOME?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1785
17129	ACCUMULO-1785	bq. That was an intentional change. Can we file a follow on ticket for the verification of a set ACCUMULO_HOME? Ok, I wasn't sure because things suddenly broke for me after this change, despite not setting ACCUMULO_VERIFY_ONLY. Opened ACCUMULO-1997.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1785
17130	ACCUMULO-1782	Is that record time? Thanks! *salute*	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1782
17131	ACCUMULO-1782	Bump! Can this ticket be resolved? Danke.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1782
17132	ACCUMULO-1778	I'm not sure I like the idea of exposing details of server configuration through the public API when it isn't needed for client operations. I'm not sure client code should have any knowledge that any monitor services even exist. At the very least, I'm concerned about this being a part of the public API. What if we replace the monitor with better monitoring solutions? What if the user isn't running a monitor? What if it is running multiple monitors? Would a utility class be better suited to this? Or maybe just put it in HdfsZooInstance rather than Instance itself? Will adding it to the Instance interface disrupt the API in undesirable ways? Is there a precedent for exposing a monitoring service within the service being monitored? It seems a bit awkward for a service to assume it's being monitored at all, never mind that it's monitored with a very specific type of monitoring tool (in this case, one that has a location attribute that it shares with the services it is monitoring).	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1778
17133	ACCUMULO-1778	Can this ticket be closed?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1778
17134	ACCUMULO-1773	Don't we need fully qualified URIs to handle multiple namenodes anyway?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1773
17135	ACCUMULO-1773	bq. Don't we need fully qualified URIs to handle multiple namenodes anyway? Any new file refs stored in the metadata table in 1.6.0 will use full qualified URIs. However relative paths can still exist in metadata from earlier versions. Unrelated to your question, the following situation is one that I was thinking of. Excluding relative paths, there can still be problems if configurations differ spatially and/or temporally # Tserver A writes a ref to metadata for hdfs://foo.com:123/accumulo/tables/9/default_tablet/0.rf # Later Tserver B writes a del marker to metadata for hdfs://foo:123/accumulo/tables/9/default_tablet/0.rf (its configured differently than Tserver A) # Accumulo GC deletes hdfs://foo:123/accumulo/tables/9/default_tablet/0.rf In the situation above a file thats referenced was deleted. The problem is that foo:123 != foo.com:123 even though they resolve to the same IP. If the Accumulo GC used /tables/9/default_tablet/0.rf instead of the fully qualified URIs, then it would not delete the file.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1773
17136	ACCUMULO-1773	bq. Don't we need fully qualified URIs to handle multiple namenodes anyway? The GC should create normalized relative paths for comparison. Absolute paths would still be stored in metadata table and used if the GC actually needs to delete something.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1773
17137	ACCUMULO-1772	Is this a strong requirement for ACCUMULO-118, or is this a nice utility that we will be needing at some point?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1772
17138	ACCUMULO-1771	Is this a dupe or abstraction of ACCUMULO-1766?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1771
17139	ACCUMULO-1771	bq. Is this a dupe or abstraction of ACCUMULO-1766? Its not a dupe of ACCUMULO-1766, but its caused by different code making the same assumption. The code treats the first configured URI specially. I am thinking the list of uris should be used as list of possible places to store new files. The configured list of uris does not represent all of the locations that Accumulo has stored files in the past. # User initializes with URI_1 in config, runs w/ this for a bit, then changes config to contain URI_2 and URI_3. # User initializes with URI_1 and URI_2, runs w/ this for a bit, then changes config to URI_0, URI_1, and URI_2 # User initializes with URI_1 and URI_2, user wants to reinit so they clear URI_1 (but forget to clear URI_2), User initializes again with URI_1 and URI_2 # User initializes instance 1 with URI_1. User initializes instance 2 with URI_2. User shuts down both instances and adds URI_2 to instance 1 config. In scenario 1 Accumulo will probablly not start because because it will look for the instance id and data version at URI_2. In secnario 2 Accumulo will look for instance id and data version at URI_0. In scenario 3 initialization may succeed even though URI_2 is dirty. Scenario 4 shows adding a dirty URI to an existing instance. A possible solution is the following. * init checks and initializes all URIs configured at the time it runs (upgrade would also need to do this) * master, tserver, etc check the set of URIs when they start and ensure instance id and data version are consistent across all. If server processes ever reload this prop, the check would need to be redone. * provide a utility to initialize a new URI. This utility would fail if the URI is not clean. The utility would have to be run before adding the URI to the Accumulo config. Another possible solution is to store the list of URIs in zookeeper and provide instance operations for mutating that list.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1771
17140	ACCUMULO-1771	What's the use case for running Accumulo with different kinds of volumes? That seems like it would be rife with consistency problems, and I would have a tough time recommending to users that they should stripe their data across HDFS and NFS, for example. Or even HDFS and MapR - the added complexity in that space is huge (as we're seeing from this and related issues). This JIRA may not be the place to have this conversation, but I'd definitely want to see us moving closer to what the rest of the Hadoop community is doing so that we can benefit from the 'free work' that it may provide.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1771
17141	ACCUMULO-1771	bq. We can move data version to zookeeper, and put zookeeper instance name in accumulo-site.xml to get the instanceId, rather than read from the hdfs path. How do you plan doing the migration to that? And does this mean that you would have to init and then distribute a new accumulo-site.xml to all of the nodes?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1771

#	Requirement	Questions	Answered	Successfully Answered	URL
17142	ACCUMULO-1769	The existing functional tests generate their own configurations to prevent clobbering known instances. Will this interfere?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1769
17143	ACCUMULO-1769	bq. The existing functional tests generate their own configurations to prevent clobbering known instances. Will this interfere? Would not want test to pick config from ACCUMULO_HOME/conf where instance.dfs.uri is defined and use the production accumulo dir. I am not sure if that could happen with this patch, buts that a concrete example of something that could possibly go wrong.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1769
17144	ACCUMULO-1769	Presuming ACCUMULO-1658 gets fixed, is the general case still a concern? As a part of that we can update the README to call out the need to have a configuration that doesn't point to your production information. How conservative do we want to be here? I was under the impression that the functional tests were already defensive in their generated configurations, since giving them access to any part of the production configuration is dangerous. The primary motivator for reading classpaths from accumulo-site.xml is so that we can cut down on how many places we have to maintain things like support jars for hadoop client. An alternative would be to switch to relying on `hadoop classpath`. The downside to this is that it's overly broad, given that for Hadoop 2 we only declare hadoop-client as needed.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1769
17145	ACCUMULO-1766	Seems like #1 is only bad in the case that an HDFS instance is removed, which can only happen if there is some migration path. #2 would probably be less vulnerable to breaking if the migration of namenode data is managed outside of Accumulo. Does anyone know if such a thing is possible. If we do go with #1 then we should have a script to handle the root tablet directory pointer migration and documentation around it.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1766
17146	ACCUMULO-1766	-1 for upgrade scripts. Do you remember nothing?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1766
17147	ACCUMULO-1761	So has this been addressed?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1761
17148	ACCUMULO-1758	Is this best implemented in Accumulo itself, or managed through whatever query application is doing the expiration? I don't think Accumulo has a concept of sessions.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1758
17149	ACCUMULO-1757	I was thinking about what the API change look like. Below is a possibility. It seems like you want the user to be able to pass a BatchWriterConfig XOR a BatchWriter. {code:java} class BatchDeleterConfig { public BatchDeleterConfig(BatchWriterConfig bwc){} public BatchDeleterConfig(BatchWriter bw){} public void setNumQueryThreads(); } class Connector { ... public abstract BatchDeleter createBatchDeleter(String tableName, Authorizations authorizations, BatchDeleterConfig config) ... } {code} Wouldn't you also want the ability to pass in a batch reader? The API above does not include that. Another approach may be allowing users to pass in a thread pool like ACCUMULO-1224	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1757
17150	ACCUMULO-1757	Isn't the binning/location cache static, though?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1757
17151	ACCUMULO-1755	Limiting binning to one thread may be unnecessary. Could bin in parallel and do a synchronous merge, similar to map reduce job w/ one reducer.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1755
17152	ACCUMULO-1755	At a glance, wouldn't a simple queue that we could dump mutations on be a simple change (would just require some memory mgmt controls)? Clients can push onto the queue to buffer mutations as long as there is free memory. Heck, we could even let users pass in the queue (and totally ignore the memory control problem). The BW can then consume and bin mutations in batches from the queue. It seems like that might be more simple to me, but I might be missing some details too :)	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1755
17153	ACCUMULO-1755	bq. At a glance, wouldn't a simple queue that we could dump mutations on be a simple change (would just require some memory mgmt controls)? In hindsight, this is pretty much what MutationSet is already doing :)	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1755
17154	ACCUMULO-1755	Dave, thanks for resurrecting this ticket! Looks like your implementation is oriented towards the "don't hold a lock while binning" branch. This should work well for a multi-threaded client sharing a BatchWriter, but probably won't affect the performance of a single-threaded client. Do you have any perf tests you're using to evaluate how well your solution works? I don't remember whether any of our examples use a multi-threaded "mutation producer" pattern. One thing we might consider is whether we want to try to optimize the case of users writing simpler single-threaded clients and letting Accumulo handle all of the parallelization. That might lead us to an alternative implementation of moving the binning operation to another thread.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1755
17155	ACCUMULO-1755	Sounds like you have a good scenario to support the changes you're proposing. Do you have any performance measurements or profiling results you can share?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1755
17156	ACCUMULO-1755	No performance numbers, just seeing BLOCKED threads in a stack trace :-). I'll see what I can do about getting some performance numbers with and without my final patch. Do you think continuous ingest would be a good framework for this?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1755
17157	ACCUMULO-1755	Github user dlmarion commented on a diff in the pull request: https://github.com/apache/accumulo/pull/75#discussion_r54292664 --- Diff: core/src/main/java/org/apache/accumulo/core/client/impl/TabletServerBatchWriter.java --- @@ -699,7 +701,16 @@ else if (Tables.getTableState(context.getInstance(), table) == TableState.OFFLIN } - void addMutations(MutationSet mutationsToSend) { + void queueMutations(final MutationSet mutationsToSend) { + queueThreadPool.submit(new Runnable() { --- End diff -- Are you suggesting re-using the existing ExecutorService?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1755

That's not immediate. Can MutationSets be binned concurrently? If so, then I can change the timer from a fixed delay to fixed rate. Thoughts?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1755
17163	ACCUMULO-1755	Github user joshelser commented on the pull request: https://github.com/apache/accumulo/pull/75#issuecomment-191289655 > which is a findbugs issue, and I don't see the issue that it's complaining about Can you reproduce it locally via `mvn verify -DskipTests -Dcheckstyle.skip`? I know the jenkins output can sometimes be... a little weird to parse for w/e reason.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1755
17164	ACCUMULO-1755	Thanks, Dave. Got any perf testing results that show how much this improved things?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1755
17165	ACCUMULO-1755	I took the test that I created and ran it against master and my feature branch with 1 to 6 threads. I didn't see much difference, but looking back at it now I think its because the test pre-creates all of the mutations and adds them as fast as possible. The test is really for multi-threaded correctness rather than performance. In the new code there is still a synchronization point when adding the binned mutations to the queues for the tablet servers. The send threads in the test (local mini accumulo cluster) must be able to keep up with adding of the binned mutations. I don't expect that to be the case in a real deployment. Good news - performance wasn't worse. I think a better test is to write a simple multi-threaded client that creates and adds mutations to a common batch writer. Then, time the application as whole trying to insert N mutations with 1 to N client threads. The previous implementation blocked all client threads from calling BatchWriter.addMutation(), meaning the clients could not do any work. In the new implementation the clients will be able to continue to do work, adding mutations, and even binning them in their own thread if necessary, before blocking. I'll see if I can re-test with this new approach in the next few days. Do you have a different thought about how to test this?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1755
17166	ACCUMULO-1748	When the test then fails for me, should I be concerned? Does it indicate that whatever was done to make the pause unnecessary is not effective?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1748
17167	ACCUMULO-1748	Is this still an issue in 1.5.1?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1748
17168	ACCUMULO-1744	The merge command in the shell has the size option. Is this what you are looking for?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1744
17169	ACCUMULO-1741	Several of us mentioned in ACCUMULO-391 that an API change would be best for 1.6.0. Should old setter methods (like addIterator(), setInputTableName(), fetchColumns()) be deprecated or just removed altogether? I ask because I'd like to design a configuration object like TableQueryConfiguration that takes a table, iterator settings, ranges, and columns that can be passed into the InputFormat like so: {noformat} public static void setTableQueryConfigurations(JobContext job, TableQueryConfiguration... queryConfigs); {noformat}	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1741
17170	ACCUMULO-1737	Bit of a tangent, but what ordering guarantees does a BatchScanner have?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1737
17171	ACCUMULO-1729	[~vines], [~mberman] - Do you know which one? It would be nice to link the two issues. If something ever comes up with the other one and we need to do a (partial) revert, then it would be useful to know that it might adversely affect this JIRA as well.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1729
17172	ACCUMULO-1728	How would this work? What is the proposed mechanism for storing and checking this flag?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1728
17173	ACCUMULO-1728	I didn't have any particular mechanism in mind when I created this ticket. It was in response to your comment in an email thread: bq. You could implement a ZK flag that reports which mode (set by the Master) the entire instance is running in, but I think this should be used only as a fast-failure when constructing a secure client connector. Were you imagining any particular implementation? Also, I see this is a lower priority than SSL support in general, so I was feeling less pressure to get this into 1.6 than the patch on ACCUMULO-1009. Do you agree with that, or do you think this is a required feature for any SSL support to get accepted?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1728
17174	ACCUMULO-1722	[~ecn] [~ctubbsii] I am not familiar with namespaces or their permissions. They seem duplicative of system permissions, is that correct? There also seems to be an accumulo namespace and a "" namespace. Shall I skip the "" namespace? I think everything looks ok, but was wondering if you could check the syntax in the resulting files when you get a chance. Steps: 1. Apply patch 2. mkdir /tmp/backup 3. Run the following commands in the shell: createnamespace foo config -ns foo -s table.cache.index.enable=false createtable baz createtable foo.baz createuser me setauths -u me -s a,b,c,d grant Namespace.CREATE_TABLE -ns foo -u me grant Namespace.ALTER_TABLE -ns foo -u me grant Namespace.BULK_IMPORT -ns foo -u me createuser you grant Table.READ -t foo.bar -u you grant Table.READ -t foo.baz -u you 4. Run the following command on the command line: ./accumulo admin dumpConfig -a -d /tmp/backup 5. Optionally, you can run them separately: ./accumulo admin dumpConfig -s -d /tmp/backup ./accumulo admin dumpConfig -n -d /tmp/backup ./accumulo admin dumpConfig -t foo.baz -d /tmp/backup ./accumulo admin dumpConfig -u -d /tmp/backup	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1722
17175	ACCUMULO-1722	[~dlmarion] wrote: bq. They seem duplicative of system permissions, is that correct? Namespace permissions are not exactly duplicating system permissions. They also have some permissions that look like table permissions. bq. Shall I skip the "" namespace? No. The "" namespace is the default namespace. This is the one that is used for tables with no namespace qualifier. {{createtable foo}} would put {{foo}} in the default namespace. This is a quite common namespace to use, since it was logically the only one available prior to 1.6.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1722

17187	ACCUMULO-1689	Are you running a local instance at the same time? I wonder if I should switch the GC to use "non-standard" ports? Or the random port stuff? Wasn't the random port stuff in 1.6? Answering my own question: yes, 1.6 ACCUMULO-1664	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1689
17188	ACCUMULO-1689	bq. Are you running a local instance at the same time? Maybe I was. I just tried running it again and it was ok.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1689
17189	ACCUMULO-1682	I've been playing around with swapping out the source iterator underneath the intersecting iterator for things that I want to query in ranges. I'm wondering if it would work to take your composite index approach and actually have the source iterator modify the key (to always be the lower bound of the range query if in fact the key is within the query range) before the key ever makes it to the intersecting iterator. In other words, let's say the term in question is AGE=>30 && AGE<=40. The intersecting iterator only needs to know that I care if AGE=30 and should tell each source iterator to begin there. If the source iterator knows about the range query AGE>=30 && AGE<=40, it can continue to iterate the keys that match but modify them to AGE=30 when getTopKey() is called. This way the intersecting iterator sees what it asked for and when the full document is retrieved, the actual value is pulled out. Excuse my ignorance if this is a big nono. I know that certain optimizations performed on scans make it very dangerous to modify keys. I can't foresee any conflicts with the order of the keys in the source iterator since I'm always rounding down and I'm scanning through increasing keys to start with. I'm assuming this has already been tried and doesn't work. Am I correct? UPDATE: Nevermind- I see better your original case about column qualifiers not being able to be returned in order unless they are somehow sorted. It works when you are querying a discrete value since the column qualifiers will be sorted already. Skipping through multiple different column families causes this not to be the case.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1682
17190	ACCUMULO-1677	Is it not possible to just load a native library off of the java classpath?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1677
17191	ACCUMULO-1675	[~ctubbsii] this really seems like a bug w/ the maven plugin. Would it be correct to say "its not correctly following maven conventions?" I switched it from improvement to bug. Feel free to switch it back if you think this is not the case.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1675
17192	ACCUMULO-1664	Does thrift let you get the local socket address after you open the port? The master does advertise its address in its lock.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1664
17193	ACCUMULO-1664	[~ecn], not sure I understand your comment. Are we hand editing generated sources now?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1664
17194	ACCUMULO-1654	Nice catch. Would it be possible to create a test that recreates this issue inorder to prevent regressions? Is there a sequence of operations (compactions, scans, splits) that will reproduce this issue? Do you think this "secret key handling strategy" deserves its own ticket? I'm thinking about the 1.6.0 release notes and wondering if it deserves its own line. It seems like this is a performance bug fix that does not change the encryption API or configuration? If its not a feature, its probably ok to lump it in with the other bug fix because. Bug fixes against unreleased features eventually just add noise to the release notes.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1654

#	Requirement	Questions	Answered	Successfully Answered	URL
17195	ACCUMULO-1654	Unfortunately I cannot think of a good way to create a test around this. We only found the bug when the OS and filesystem caching lined up *just so* such that one only got a few bytes back from reading an IV rather than the whole 16 bytes. Creating that kind of a boundary condition within a real-world scenario with any consistency as to become part of an automated suite.... I'm just not sure how I would go about it. Fiddle with a bunch of OS settings? This one was definitely wiley and took a while to appear during a continuous ingest run (many hours). There was no consistent set of actions that lead to its appearance. As far as the secret key handling strategy goes, I'd just consider it as part of the overall bug fix for the encryption stuff. No need for a separate line.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1654
17196	ACCUMULO-1654	I think what you would have to do to deterministicly replicate this is mock up a file system that just gives one byte at a time. That could be done as a simple wrapper that is inserted in some of the existing unit tests. Might be worth it if it is that easy, but I could go either way. Is this something a system like FindBugs would have caught?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1654
17197	ACCUMULO-1654	bq. Unfortunately I cannot think of a good way to create a test around this. I suspected this, but was not sure. So for release testing we probably need to run continuous ingest w/ and w/o encryption inorder to catch bugs like this. However this may be forgotten. Running random walk on a cluster may have caught this also. Maybe random walk needs the ability to generate a random config for Accumulo. This would allow random walk to run with encryption sometimes and sometimes without. Actually I suppose this random config generator could be use for continous ingest also. bq. Is this something a system like FindBugs would have caught? Seems possible. I suppose if you are calling read() w/o checking how much was read, that could be detected via static analysis. If find bugs does not have this check, it probably should.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1654
17198	ACCUMULO-1654	I applied the patch. I added the ticket number to the commit message. I just noticed that SecretKeyCache.ensureSecretKeyCacheInitialized() catches an IOException and only logs it, was that intentional?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1654
17199	ACCUMULO-1652	Is there accompanying documentation that should be updated with this? If we don't already, it would be nice to enumerate the environment variables that are configurable through $ACCUMULO_CONF_DIR/accumulo-env.sh	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1652
17200	ACCUMULO-1643	Are we specifying the *earliest* version we support, or the best version? I would like to update it, but I'm just the accumulo guy, and not the poor person sitting on top a heap of integration that happens to use accumulo.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1643
17201	ACCUMULO-1643	Best version, although I don't think it matters. AFAIK, compiling against 1.0.4 or 1.2.1 hasn't caused me any strife to date (it would also go against the whole semantic versioning...) From what I read, Hadoop typically said "if you're using 1.0.x, update to 1.1.x", and then "if you're using 1.1.x, update to 1.2.x", which would also imply to me not having any issues doing this.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1643
17202	ACCUMULO-1643	bq. will a 1.2.1 compiled version run fine against a 0.20.203? Building against 1.2.1 runs just fine against 0.20.205.0 locally. As the saying goes, it works on my machine.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1643
17203	ACCUMULO-1643	This was reopened for 1.5.1. Is it done now?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1643
17204	ACCUMULO-1641	the Wikisearch contrib is also guilty of this and should be fixed. Can someone add a component for "examples" so we can mark this properly?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1641
17205	ACCUMULO-1634	It means Ctrl-C will abort and will not forcibly shutdown the servers. Do you have a suggestion for a better message or a better way to interact users during shutdown?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1634
17206	ACCUMULO-1634	One thing I'd like to have clear in the message, is that Ctrl-C will only cancel the *forced* shutdown. It will not abort the managed shutdown that has already been attempted (and which may still succeed). Aside from that, my only concern is the lack of brevity in these messages. I'd prefer to keep script messages under 80 chars per line. How about separate messages for the forced shutdown case, and the successful shutdown + kill unresponsive servers case? Forced shutdown case: {code} Invalid password or unable to connect to the master Initiating forced shutdown in 15 seconds (Ctrl-C to abort) Initiating forced shutdown in 5 seconds (Ctrl-C to abort) {code} Normal shutdown case: {code} Accumulo shut down cleanly Utilities and unresponsive servers will shut down in 5 seconds (Ctrl-C to abort) {code}	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1634
17207	ACCUMULO-1627	See [discussion on ACCUMULO-1734|https://issues.apache.org/jira/browse/ACCUMULO-1734?focusedCommentId=13780097&page=com.atlassian.jira.plugin.system.issuetabpanels:comment-tabpanel#comment-13780097] for background. The method {{Mutation.equals(Mutation)}} is problematic for implementing {{equals()}} properly in a subclass. In short, for some object {{o}} of a subclass type {{SubMutation}}, a call to {{o.equals(m)}} where {{m}} is a {{Mutation}} will be bound to {{Mutation.equals(Mutation)}}, not {{SubMutation.equals(Object)}}. This is because the {{Mutation}} method has a more specific argument type, so the compiler prefers it over the proper one in the subclass. This is a problem for preserving symmetry for {{equals()}} as well as for checking additional fields in the subclass. {code:java} Mutation m = /* some mutation */; SubMutation sm = /* some other mutation */; sm.equals(m); /* <- bound to Mutation.equals(Mutation) */ {code} To remedy this I had thought to protect/rename {{Mutation.equals()}}, relegating it to a utility comparison method which it appears to be. However, as Keith suspected, this would break ABI compatibility. Code compiled against the old version would throw {{NoSuchMethodError}}. Another option is to have each {{Mutation}} subclass also override {{equals(Mutation)}}. It's messy but it should work. So, what is the best path according to the development policies for Accumulo? "Fix" the API at the expense of breaking the ABI, or introduce (modest) warts to work with what already exists? Thanks all.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1627
17208	ACCUMULO-1623	Janitor?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1623
17209	ACCUMULO-1621	When we dropped RPM/DEB packaging, I believe we also dropped all of our service scripts. Can this issue be re-scoped or closed out?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1621
17210	ACCUMULO-1612	Why is this a won't fix?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1612
17211	ACCUMULO-1602	Don't tablets already have fixed length id's? I thought this was what corresponded to the HDFS directory. Isn't the point of hashes that they are one-way and hard to reverse?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1602
17212	ACCUMULO-1602	bq. Don't tablets already have fixed length id's? I thought this was what corresponded to the HDFS directory. KeyExtent has a getUUID() method which basically hashes the extent. I think the monitor uses this. Older versions of Accumulo may have used this for the HDFS dir, newer versions use a counter from zookeeper. The tablets directory could be used instead of the hash, it would be shorter and should be unique. bq. Isn't the point of hashes that they are one-way and hard to reverse? The utility I was thinking of would scan the metadata table hashing each tablets extent until it finds the extent in question. If the tablets dir were used, then a special utility would not be needed. Could just grep the metadata table. There is one issue with using the tablet dir, it will not distinguish tablets that split. One of the children from a split will have the same tablet dir as the parent. Sometimes when debugging its important to distinguish the parent from the child. We could generate a unique id for each tablet and store this in a column in the metadata table. This allows the tablet to be found with grep in the Accumulo shell. The monitor could display this id.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1602

#	Requirement	Questions	Answered	Successfully Answered	URL
17213	ACCUMULO-1602	I am not a fan of a utility that, in essence, is running a brute force attack on the hash that we're trying to find. This also puts up a huge barrier to the usefulness of the naming. Why are we even worrying about this? Is there a max length to thread names that we need to fit in? What are the semantics for automatic expansion in a range compaction? Does it include the whole row? The whole tablet? Is this part of the API contract and specified in the docs, or is it simply a side-effect of the implementation?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1602
17214	ACCUMULO-1602	bq. Why are we even worrying about this? Is there a max length to thread names that we need to fit in? I look a the output of jstack alot and did not like the idea of a really long thread name. But thats just my preference. I looked at the current KeyExtent toString(). The max length it will print is around 160 to 170 bytes. Of course that could be modified to make it truncate more. Another thing to consider is that jstack output is shared for debugging purposes. If the jstack contained KeyExtents, then it possible it contains data from a table. A user may inadvertently share data from their table that they did not want to when sharing a jstack.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1602
17215	ACCUMULO-1602	bq. Another thing to consider is that jstack output is shared for debugging purposes. If the jstack contained KeyExtents, then it possible it contains data from a table. A user may inadvertently share data from their table that they did not want to when sharing a jstack. Don't we already have this "concern" with listscans? If you jstack a tserver running a scan, you have the extent in there. I personally don't think this is a big concern. If you have the *ability* to jstack/`kill -3` the tserver process and view the output, you likely can just print the rfile.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1602
17216	ACCUMULO-1602	bq. It was about the practice of sharing jstack output for debugging. If jstack contains KeyExtents, then jstack may need to be scrubbed of user data before sharing for debugging. Are you stating this as a concern about doing this or just stating it?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1602
17217	ACCUMULO-1602	bq. Are you stating this as a concern about doing this or just stating it? I think its an important consideration. It impacts how easy it is to share a jstack of Accumulo. This would be an incredibly useful feature, We have at least three options # Put table id in thread name # Put keyextent in thread name # Put tablet id in thread name I am in favor of 2 or 3. Considerations for #2 * easy to immediately use the jstack output * may have to be edited before sharing * user may not edit before sharing and leak info * more noise when examining jstack output Considerations for #3 * user can immediately share jstack output when seeking help, * have to take the tablet id and do a lookup somewhere to get the extent. * less noise when examining jstack output Personally I am in favor of #3. But I am not opposed to #2.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1602
17218	ACCUMULO-1601	Duplicate of ACCUMULO-1464. That ticket is marked with a fixVersion for 1.5.1 also, but this ticket isn't. Will this fix migrate easily to 1.5.x?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1601
17219	ACCUMULO-1599	Is there some magic that can automatically grab the test method name? Maybe munge the stack?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1599
17220	ACCUMULO-1599	Turns out we generate many gb of data in the mac directory in each test batch, so we certainly shouldn't save more than the last copy, and I'm not even sure it makes sense to do that. All I ever care about are the logs, so I'm thinking about cleaning everything else up after the test. Does that seem reasonable? Are there other subdirectories that should be nominated for saving?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1599
17221	ACCUMULO-1599	Is this ticket resolved?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1599
17222	ACCUMULO-1585	I'm signing up to do this, but I will take all the help I can get. I'll make it a priority to review/patch. If you can do it yourself, please reassign the ticket. Is there some approach we should take, similar to the way that datanodes self-identify to the namenode? That might be even better than the FQDN.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1585
17223	ACCUMULO-1585	[~nsfw], did you have a chance to do heavier testing on this?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1585
17224	ACCUMULO-1581	Going to take a look at this but should it be limited by default? The JIRA references the behavior of the scan command which limits the output based on the showFewOpt and the default is not limited. For CLI consistency I would think we would want listscans to match the behavior of scan.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1581
17225	ACCUMULO-1578	bq. As a user, I would find it frustrating if I accidentally typoed my password and then proceeded type out a longer command, only to have it them come back as a failure. Are you referring to the shell when you say type out a command?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1578
17226	ACCUMULO-1576	How is this different from setting a different ACCUMULO_CONF_DIR for different runs? What is the benefit to having this as a separate variable?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1576
17227	ACCUMULO-1561	Superceded by ACCUMULO-2606 for 1.6.0 and later.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1561
17228	ACCUMULO-1557	Sounds great. I have a few more updates for the system tests -- are the continuous ingestion and random walk tests affected by these rewrites?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1557
17229	ACCUMULO-1551	I took a look at the changes. This API change builds around EntryConverter, which converts a Key+Value to an arbitrary Java object. As you mentioned this approach may not work well w/ heterogeneous data. Typo suffered from the same issue, however I think Typo was more rigid than EntryConverter. At first glance I think EntryConverter is an improvement over typo, it seems more flexible. I think some examples of using the API would make it easier to evaluate and understand it. Do you plan to address writing data? Does anyone know other APIs that abstract Accumulo's API? Typo and Gora were mentioned in the description. I have also seen [Accumulo-Fluent|https://github.com/Berico-Technologies/Accumulo-Fluent] When experimenting w/ Typo I took the approach of building a prototype API on top of the existing Accumulo API. I found this to be an easier way to explore the concept.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1551
17230	ACCUMULO-1551	[~ekohlwey]: I think the branches in github have diverged too much to make sense out of. Do you have an updated version of example code/static diff for your illustration?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1551
17231	ACCUMULO-1542	Commit 46b49658bce215fb8c74952a28491d7dddb929a7 in branch refs/heads/master from [~ecn] [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=46b4965] ACCUMULO-1542 merge 1.5.1-SNAPSHOT to master	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1542
17232	ACCUMULO-1537	Chiming in here from the perspective of a "I'm new to Accumulo and I'm not sure how to make it build": When I'm coming into a new project that's Maven-based, generally the first thing I will do after pulling source is mvn clean install If this causes a build that takes 30+ minutes, I am pretty sure this isn't a great first-time developer experience (or a not-first-time developer experience). Might I suggest putting a few choice integration tests on the main "mvn clean install" pathway and hide the rest behind a profile?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1537
17233	ACCUMULO-1537	bq. Josh Elser and .. I think you mean "mvn verify". Nope, meant what I wrote which was essentially the same thing you elaborated upon. For day-to-day development, install is most likely not the lifecycle a user should be invoking. bq. If this causes a build that takes 30+ minutes, I am pretty sure this isn't a great first-time developer experience (or a not-first-time developer experience). Might I suggest putting a few choice integration tests on the main "mvn clean install" pathway and hide the rest behind a profile? I don't think we should be going against Maven conventions just to make a random first-timer have a "better" experience. In my opinion, if anything, we should go out of our way to encourage proper usage of Maven for the task at hand, which, again, is likely not `mvn install` as releases are available through maven-central (and wouldn't require a user to install the artifacts into their local repository).	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1537

#	Requirement	Questions	Answered	Successfully Answered	URL
17234	ACCUMULO-1537	I'm having compile problems on trunk currently on the Testing module. The root cause is that some tests in ./test/src/main depends on code in ./test/src/test (MacTest is the base class of several and lives in ./test/src/test and is depended upon by tests in ./test/src/main) Moving MacTest to ./test/src/main requires junit be a main dependency as opposed to a testing dependency. With the patch attached, the Testing Modules builds. (currently running, will report in the morning).	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1537
17235	ACCUMULO-1528	Maybe the VersioningIterator should return all values instead of non-deterministically picking one? Where are you thinking of finding the source identity and how would it be stored? On Fri, Jun 21, 2013 at 10:36 AM, Christopher Tubbs (JIRA)	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1528
17236	ACCUMULO-1528	Do you mean when there are keys that are non-unique including timestamp?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1528
17237	ACCUMULO-1528	{quote}Do you mean when there are keys that are non-unique including timestamp?{quote} Which specific statement would you like me to clarify? {quote}If we go by file name/file timestamp...{quote} Acknowledged. I'm not proposing a solution, just identifying the problem.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1528
17238	ACCUMULO-1516	[~vines] - With the metadata table being split into two tables, I'm not sure how it would be sensible to keep that constant around. The code is still open for improvement, and I've been thinking about additional improvements under the parent ticket of this one (ACCUMULO-1481). For example, I've been working towards a cleaner API for metadata table operations (still designed for internal use). Do you have a comment on the MetadataServicer I added? I do plan on moving more code into that, and am open to feedback. However, I don't see how we can sensibly preserve the METADATA_TABLE_NAME constant, as any reasonable way somebody might have been trying to use this (despite it not being in the public API), will likely be broken by ACCUMULO-1481. I did try to preserve the Constants.NO_AUTHS as deprecated (and replaced it with Authorizations.EMPTY), because I thought that is something users would likely use. I'm also willing to deprecate other constants, as needed, but I don't see merit in preserving them all, since they were never part of the public API, and most aren't even useful outside of internal code.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1516
17239	ACCUMULO-1516	I was looking at this earlier today, and there is still a lot of znode stuff in the Constants file. Might it make sense to move that out to other files as well (likely in a follow on JIRA, since it would be out of scope for a root table subtask)?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1516
17240	ACCUMULO-1515	Is there any reason the README can't refer to the packaged user guide or the website for that information, though?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1515
17241	ACCUMULO-1515	The build.sh script does not seem focused on the person who wants to build from source and then deploy. Does it make sense to add the following? '--locally-deploy' option to perform "mvn package -DskipTests -DDEV_ACCUMULO_HOME=/var/tmp". '--make-deploy_artifacts' to perform "mvn package -P assemble". '--make-documentation' to perform "mvn package -P docs -DskipTests" With these options explicitly represented in build.sh (and a few comments) I can see the README file reduced in size.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1515
17242	ACCUMULO-1515	Right. Just to be clear, I didn't make the build.sh script. I only modified it to work better for creating and testing release candidates in 1.5.0. I'm not even sure I like it, but since it's there, I think I agree it could be modified to make it easier to build something ready for immediate deployment locally. However, I'm not entirely sure what the goal is. Is the goal to provide an easier mechanism for somebody unfamiliar with maven to build from source? Or, is the goal to document the correct maven command-line options to create the desired build artifacts, under the premise that the user is familiar with maven already (or is willing to become familiar with it as a prerequisite)? I think I'd almost rather just enumerate the profiles that are available on the command line, and explain how they affect the resulting artifacts. The nice thing about the script, though, is that it's easier to document once... and we just change the script, as needed, to activate different profiles if the necessary profiles change between releases.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1515
17243	ACCUMULO-1515	How about moving the maven profile documentation to docs/maven.html? The README file can point there. We can leave the build.sh as is. If there a few +1 votes for this change, I would not mind putting the initial draft together. I'm sure I'll miss details though. On Fri, Jun 14, 2013 at 11:17 PM, Christopher Tubbs (JIRA)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1515
17244	ACCUMULO-1515	[~bills] wrote: {quote}Would using to the README/INSTALL file convention a lot of projects have alleviate some of this concern? ....{quote} Possibly. The README could be very minimal and not change much, because the project description and links to more information won't change much. We'd have to clarify what the INSTALL file is, though. Moving it to a separate file doesn't necessarily help minimize doc maintenance or consolidate docs. Is INSTALL for the binary tarball, explaining how to run, or is it for the source tarball, explaining how to build, or both? At some point the contents... whether in README or INSTALL, have diminishing value, as we try to explain every possible scenario (building DEB/RPMs, building binary tarball from source, explaining all the maven profiles and options, etc.). If it were as simple as {{./configure && make}}, I'd be fine with that... because configure scripts and Makefiles in other projects often support making many different targets and the INSTALL files don't usually try to explain all of the different options. Unfortunately, we do, and that's where the value begins to diminish, becoming a tutorial on maven and instructions on every build option rather than a quickstart guide for 90% use case coverage. If we can reduce these instructions to a single one-line maven command, I'm all in favor. If we follow other examples, the INSTALL file should contain basic information about build dependencies and instructions on how to build the source in its entirety (PDFs, RPMs, DEBs, tarballs, everything) with default options (default hadoop profile, for instance). It should not be an attempt to explain every profile and build option, just as other projects don't attempt to explain every Makefile target or ./configure flag which is available. It's not too much to expect somebody diverging from the basic "build all" option to learn the build system and read the build configuration files.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1515
17245	ACCUMULO-1504	Added hashcode() and equals(Object obj) methods to the IteratorSetting class via eclipse method generator. They look good, do we need test cases?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1504
17246	ACCUMULO-1504	bq. do we need test cases? Yes, please.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1504
17247	ACCUMULO-1504	Hey Miguel, can you please follow the coding style for your new patch? I take it you're using eclipse given your comment, so you should be able to follow these instructions at the bottom of the page http://accumulo.apache.org/source.html	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1504
17248	ACCUMULO-1504	[~bluerain], thanks for your contributions. In the future, can you leave multiple versions of your patches attached to the tickets? It is nice to be able to trace history through comments and the patches.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1504
17249	ACCUMULO-1503	ACCUMULO-633 was the only issue addressed in the 1.3 branch since 1.3.6 was released. Since it's not a bug in 1.3, and since it would change behavior, I do not think it should even happen for 1.3.7, never mind warranting going through the release process.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1503
17250	ACCUMULO-1503	[~ctubbsii], is there still any work left to do on this issue?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1503

#	Requirement	Questions	Answered	Successfully Answered	URL
17251	ACCUMULO-1502	I would like to help out here. I have starting playing around with tracing and have seen the existing docs in docs/distributedTracing.html. I just have a few initial questions, technical and administrative. 1.) Should the documentation go in 1.5.1-SNAPSHOT? Seems like it would be reasonable to get into the 1.5 code 2.) Is the Administration chapter of the user manual the appropriate place? Maybe right after Monitoring? 3.) What server-side operations are traced by default? I have seen minor/major compactions and GC. 4.) Sampling rate is currently left explicitly to the user via CountSampler, correct? 5.) Is there a good way to trace a write without flushing the BatchWriter? I know the actual writes to the tablet servers are asynchronous from adding mutations so maybe it isn't possible. Thanks for any feedback that can be provided.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1502
17252	ACCUMULO-1502	Just added a patch to the Administration chapter of the docs. Does the User Manual HTML get generated somehow from the TeX? I also started examples at https://github.com/jaredwinick/accumulo-tracing-example that could be incorporated in with the other samples if desired. With respect to #5 above, I am unable to get the behavior you describe (tracing of writes without explicitly calling flush()) to work. I have attempted to make sure the asynchronous writes inside the BatchWriter have completed by setting the timeout very low, but still no luck.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1502
17253	ACCUMULO-1501	Hmm. Do you think the trace ttl should be a configurable property, or would it be better to pick a default value and make users change the property on the table manually?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1501
17254	ACCUMULO-1499	I have no objections. What's the benefit of moving it?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1499
17255	ACCUMULO-1499	Miguel, I took a look at your patch. Were you on an updated 1.6.0 branch when you made the change? The initialize() method in your patch seems to be missing some content. Here's the content that I have from 1.6.0: {code:java} /** * Set directories and fully populate site config */ MiniAccumuloConfig initialize() { if (!initialized) { libDir = new File(dir, "lib"); confDir = new File(dir, "conf"); accumuloDir = new File(dir, "accumulo"); zooKeeperDir = new File(dir, "zookeeper"); logDir = new File(dir, "logs"); walogDir = new File(dir, "walogs"); String classpath = System.getenv("ACCUMULO_HOME") + "/lib/.*.jar," + "$ZOOKEEPER_HOME/zookeeper[^.].*.jar," + "$HADOOP_HOME/[^.].*.jar," + "$HADOOP_HOME/lib/[^.].*.jar," + "$HADOOP_PREFIX/share/hadoop/common/.*.jar," + "$HADOOP_PREFIX/share/hadoop/common/lib/.*.jar," + "$HADOOP_PREFIX/share/hadoop/hdfs/.*.jar," + "$HADOOP_PREFIX/share/hadoop/mapreduce/.*.jar"; mergeProp(Property.INSTANCE_DFS_URI.getKey(), "file:///"); mergeProp(Property.INSTANCE_DFS_DIR.getKey(), accumuloDir.getAbsolutePath()); mergeProp(Property.INSTANCE_SECRET.getKey(), DEFAULT_INSTANCE_SECRET); mergeProp(Property.TSERV_PORTSEARCH.getKey(), "true"); mergeProp(Property.LOGGER_DIR.getKey(), walogDir.getAbsolutePath()); mergeProp(Property.TSERV_DATACACHE_SIZE.getKey(), "10M"); mergeProp(Property.TSERV_INDEXCACHE_SIZE.getKey(), "10M"); mergeProp(Property.TSERV_MAXMEM.getKey(), "50M"); mergeProp(Property.TSERV_WALOG_MAX_SIZE.getKey(), "100M"); mergeProp(Property.TSERV_NATIVEMAP_ENABLED.getKey(), "false"); mergeProp(Property.TRACE_TOKEN_PROPERTY_PREFIX + ".password", getRootPassword()); // since there is a small amount of memory, check more frequently for majc... setting may not be needed in 1.5 mergeProp(Property.TSERV_MAJC_DELAY.getKey(), "3"); mergeProp(Property.GENERAL_CLASSPATHS.getKey(), classpath); mergeProp(Property.GENERAL_DYNAMIC_CLASSPATHS.getKey(), libDir.getAbsolutePath()); mergePropWithRandomPort(Property.MASTER_CLIENTPORT.getKey()); mergePropWithRandomPort(Property.TRACE_PORT.getKey()); mergePropWithRandomPort(Property.TSERV_CLIENTPORT.getKey()); // zookeeper port should be set explicitly in this class, not just on the site config if (zooKeeperPort == null) zooKeeperPort = PortUtils.getRandomFreePort(); siteConfig.put(Property.INSTANCE_ZK_HOST.getKey(), "localhost:" + zooKeeperPort); initialized = true; } return this; } {code}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1499
17256	ACCUMULO-1499	Miguel, Would you like me to add you to the contributors page? Let me know if you want me to add an organization/timezone.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1499
17257	ACCUMULO-1499	[~sonixbp], what version of the thrift compiler are you using? It seems you have checked in slightly different thrift code than that generated by my version of thrift 0.9.0.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1499
17258	ACCUMULO-1499	bq. Would you like me to add you to the contributors page? Let me know if you want me to add an organization/timezone. I just added him, btw. I was chatting with him online and bugged him about his info :)	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1499
17259	ACCUMULO-1498	bq. I'm attaching ctubbsii-git-suggestions.v1.txt with branching scenarios, based on conversations with Josh Elser and Keith Turner. I like most of this. Thanks for taking the time to write it down. My first concern was being crystal clear about when people can rebase/cherry-pick and when they must merge. Perhaps this is beating a dead horse though, "perform local development" should be sufficient. bq. I'm attaching ctubbsii-git-proposed-actions.v1.txt as a rough guide to the transition, assuming the previous attachment represents the target branching model. Questions: 1. [~billie.rinaldi@gmail.com] was correct when she said the site must stay in SVN to use the [CMS|http://www.apache.org/dev/cms.html#subversion] 2. Contribs move to their own repositories since they are separately versioned. See the number of Cordova repositories [here|https://git-wip-us.apache.org/repos/asf]. 3. Need to verify this one. Not sure if the infrastructure itself enforces ASF policy (cannot delete tags, cannot {{git push --force}} and rewrite history). Actions: 1. Need to remember to request this 4. Probably/Maybe? I'm not sure how robust git+svn clone is here. Verification/validation before the transition is complete would be necessary. 5. Not sure I follow this one. SVN branches will appear as git branches, and SVN tags as git tags. Verification/validation again. 6. Should pre-date 5 7. I hope to roll the existing source guide into the WIP doc I already started.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1498
17260	ACCUMULO-1498	{quote} Actions: 1. Need to remember to request this {quote} We could rename the branch ourselves if necessary, but probably they'd need to do it for us so it's the default branch when cloning. {quote} 4. Probably/Maybe? I'm not sure how robust git+svn clone is here. Verification/validation before the transition is complete would be necessary. {quote} Right now, I'm pretty sure the branches *don't* merge cleanly, so it would be very annoying if this made git branches not merge cleanly. If fixing it in SVN first will make git-svn and git happy later, we should do that. I'd really love to close the 1.3 branch prior to switching... it's one less branch we'd have to deal with. I'd also like to get this transition done *prior* to releasing 1.6.0, so we don't add another branch in the chain to deal with. {quote} 5. Not sure I follow this one. SVN branches will appear as git branches, and SVN tags as git tags. Verification/validation again. {quote} Right, but these are the long-running old versions branches we've discussed. This is related to number 4. The main point being that eventually, all the last tags in each series should merge forward cleanly. What we don't want to do is tag them without making them merge cleanly first... that would be *VERY* frustrating when doing bugfixes in older versions. {quote} 6. Should pre-date 5 {quote} Number 5 would create some more... unless you're including branch cleanup as part of the tagging process, then we're thinking similarly.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1498

#	Requirement	Questions	Answered	Successfully Answered	URL
17261	ACCUMULO-1495	Isn't that a completely separate way to just make the tabletserver "do less"? (sounds like its own JIRA issue if it's something you want to pursue..)	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1495
17262	ACCUMULO-1494	Currently you can do bin/accumulo -add /path/to/example.jar:/path/to/example-dependency.jar com.example.ExampleMain --foo bar. Is that not sufficient?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1494
17263	ACCUMULO-1494	{quote}in the classpath local to the invocation, but [not] added to the classpath for any of the server processes{quote} How is this different from simply doing something like the following? {code} CLASSPATH=my.jar bin/accumulo shell {code}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1494
17264	ACCUMULO-1494	I will. Can you point me to information about the style formatter?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1494
17265	ACCUMULO-1494	[~bhavanki], is this issue resolved to your satisfaction?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1494
17266	ACCUMULO-1493	[~kbotzum], are you planning on submitting a patch for this that could be included in 1.6.0? I'm trying to weed out tickets that aren't going to be done for 1.6.0.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1493
17267	ACCUMULO-1491	What about firewalled networks? I imagine bundling them would be rather nice in that case. Maybe an alternative is to add a link on the monitor to the "most-up-to-date" version of the docs on a.a.o, but leave the release docs in place?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1491
17268	ACCUMULO-1491	this may sound crazy, but could we build an exported version of all our keep-in-one-place docs and include that in the binary dist? then have a config option in the monitor for pointing to the export vs live.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1491
17269	ACCUMULO-1490	What's the plan for the documentation? I'm concerned about making all the documentation only on the website, because that requires web access. Moving the html documentation pages to the website makes sense, and I might even be in favor of moving the user manual there. But it would be nice to keep minimal building information and examples packaged with our releases.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1490
17270	ACCUMULO-1490	Does anyone see value in using the Hadoop wiki [1] for documentation? It would certainly help as a place for keeping more up-to-date and dynamic documentation. The downside is that web access would be required, although it can generate printable pages. [1] http://wiki.apache.org/hadoop/	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1490
17271	ACCUMULO-1488	Do you think configuring the static inner class may throw some users? I think user will need to use a dollar sign for the last separator when configuring these, for example : {noformat} setiter -c org.apache.accumulo.core.iterators.user.BigDecimalCombiner$BigDecimalMaxCombiner ... {noformat} For 1.5.0 we have started adding since tags. The code should probably have a "@since 1.5.1,1.6.0" tag in the javadoc at the class level. Not sure if the inner classes will need it or if they will take it from the outer class. Also, there was some discussion about porting new features back to bug fix branches, and there was not really a consensus.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1488
17272	ACCUMULO-1488	What is the advantage of back-porting instead of contributing a jar that can be dropped into the lib/ext directory?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1488
17273	ACCUMULO-1488	{quote} What is the advantage of back-porting instead of contributing a jar that can be dropped into the lib/ext directory? {quote} I see none, and this would be my preferred method of supporting these in an older version, since they are completely modular and can be delivered in this way. At the *very* least, I think backporting a feature from a newer version when that newer version isn't even yet released (and therefore finalized in some way) creates an undue burden on *all* developers who could receive questions from users. If some users start having problems with this feature in 1.5.1 and later, or design code around it assuming it's available in 1.5.x, but have to migrate to 1.5.0 (due to a bug in 1.5.1, for instance), it will *not* be sufficient for me to tell them "[~afuchs] volunteered to take responsibility for that". Personally, I would like to see backported features (just features, not bugfixes) voted on for inclusion in a prior release line, precisely because of the additional support and maintenance risks.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1488
17274	ACCUMULO-1486	Are you sure we don't want to wait until the third RC of Accumulo 1.7.0 to solve this problem? We're kinda breaking with tradition here! ;-)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1486
17275	ACCUMULO-1483	Right, so it will include classes that aren't actually part of the published API if you must have something in the path to instantiate one of the public interfaces. e.g. instantiating ZooKeeperInstance requires that log4j be present, even though the client API doesn't make any claims about the log4j Logger. Making core take over this functionality is going to be ugly, and add some complexity to downstream people who don't actually want those transitives (since they'll need to do excludes). Better to have a different module, atleast for now. Do you have an exemplar user of this in mind?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1483
17276	ACCUMULO-1483	[~ctubbsii], what's the status? Please mark this as blocker if it needs to happen for 1.7.0 or update the fixVersion accordingly.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1483
17277	ACCUMULO-1482	I like the idea of making a system namespace and putting !METADATA and !!ROOT (assuming that also comes to fruition) into it. Assuming we do so, is there any more reason to put one to many !'s in front of METADATA (and ROOT)? I know [~mdrob] had some frustrations with jline2, history and ! being interpreted as a meta-character. From my understanding, the !'s were only to make them sort to the top of the monitor page for most people and be something unlikely for a user to want to use. Locking them into a system namespace seems to serve the same purpose then. Am I missing something else?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1482
17278	ACCUMULO-1482	{quote}is there any more reason to put one to many !'s in front of METADATA (and ROOT){quote} No, absolutely not. Implementing this feature would allow us to use normal table names for these system tables (we don't even have to make them upper-case to make them stand out). {quote}the !'s were only to make them sort to the top of the monitor page{quote} That's not the only reason. It's also that way for historical reasons, because, before tables had permanent IDs and could be renamed, table names (instead of IDs) were in the !METADATA table the !METADATA table's own tablets stored in the root tablet had to sort before other tables' tablets. (This is still a requirement, unless/until ACCUMULO-1481, but now applies to the table ID, which is why the tableID is now !0 for the !METADATA table).	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1482
17279	ACCUMULO-1482	Does it makes sense to have a reserved "" namespace for internal use? Then we literally will have nothing reserved as a system namespace.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1482
17280	ACCUMULO-1481	Wait, what? Are we splitting and merging the root table now?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1481
17281	ACCUMULO-1468	Doesn't the maven-release-plugin automatically tag for you? Can it be configured to use signatures, or do we have to break automation to accomplish this?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1468
17282	ACCUMULO-1468	bq. Doesn't the maven-release-plugin automatically tag for you? Can it be configured to use signatures, or do we have to break automation to accomplish this? Yes, it can do this automatically for you. I'm not sure if an option already exists that would do this automatically too. I'll look into it.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1468
17283	ACCUMULO-1468	Should that document be merged with http://accumulo.apache.org/governance/releasing.html ?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1468
17284	ACCUMULO-1459	How do you know that a key will exceed a threshold until after you've passed it?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1459

#	Requirement	Questions	Answered	Successfully Answered	URL
17285	ACCUMULO-1459	bq. How do you know that a key will exceed a threshold until after you've passed it? I am thinking this can be pushed down to the deserialization code in rfile.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1459
17286	ACCUMULO-1458	The basic WordCount example itself can be used with a token file (just do -tf tokenfile rather than -p password), but I also added an example that doesn't use the ClientOpts argument parsing stuff. Also included a detailed explanation in README.mapred (and also found a small typo, forgot a -t in a command).	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1458
17287	ACCUMULO-1454	This ticket make me laugh because my team at Toyrus.com developed rolling restart functionality back in 1999. We tracked the number of sessions assigned to each server using a load balancer. When a given server needed to be restarted, the load balancer changed the server's state to something like 'restarting' and did not send any sessions to it. The server would periodically check it's own status. If it saw 'rebooting' and it had zero sessions then it restarted itself. Is there some time delay before tablets are reassigned? Can the tserver restart within that window of time?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1454
17288	ACCUMULO-1454	[~medined] wrote: {quote}Is there some time delay before tablets are reassigned? Can the tserver restart within that window of time?{quote} I think that's the key to an elegant solution here: ensure a delay long enough for the tserver to come back and continue serving the tablets it had been, to avoid rebalancing the whole cluster, but not so long that a failure to come back would prevent re-assignment entirely.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1454
17289	ACCUMULO-1454	bq. Maybe the 'restarting' status has a lease? Server must become responsive within a configurable time period. +1 bq. Currently when a tablet is closed, it interrupts running scans. Waiting for scans to finish is tricky, because it seems like you would not want to allow new scans to start. So while the scans running before close would see no delay, scans started after close will still see a delay. Would it make sense to "double host" tablets? Let existing scans finish on a tserver that is about to go down, meanwhile, load those same tablets elsewhere and point new scans to the new locations. At the end of the whole process, run one final balance to shake things out.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1454
17290	ACCUMULO-1454	How do you plan to deal with port conflicts?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1454
17291	ACCUMULO-1454	bq. How do you plan to deal with port conflicts? For any current version, the config could be modified to start up the "sidecar" processes with a port value of '0'. I've done pretty extensive testing in making sure we can bring up a cluster using completely dynamic ports.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1454
17292	ACCUMULO-1454	I was thinking about use cases. * Administrator has 20 of 100 nodes with screwy java memory config, wants to fix those nodes w/ minimal impact. * Administrator has 100 of 100 nodes with screwy java memory config, wants to fix those nodes w/ minimal impact. * Administrator wants to upgrade cluster from 1.7.0 to 1.7.1 w/ minimal impact Are there any other important use cases? The first two are covered in the ticket description, I split them into two because one is a subset of tservers.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1454
17293	ACCUMULO-1454	bq. If we expose a user level command to request that a tablet be moved to a given destination Do we necessarily care where they move? I don't have a good feel for the difference in cost between moving to a "sibling" tserver on the same node as opposed to a tserver on a completely different node. We also might just be fighting the balancer if we make it seem like the user has control over where a tablet is hosted. HBase has such a tool, no? Can we glean anything from their rolling upgrade support (good and bad)?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1454
17294	ACCUMULO-1454	bq. start a lot of new tserver instances This might be more difficult than it sounds. {{start-server.sh}} is fairly easy to manage, but {{stop-server.sh}} is pretty aggressive about just {{kill}}'ing the process on a host. I think we might have to expand on the shell scripts to really give an admin what they want. bq. migrate tablets <tserver instance src> <tserver instance dest> Would you consider this a FATE op that the master coordinates, or would you just add something directly to the TServer and let the client handle the coordination? Would that just bash ZooKeeper trying to migrate tablets off of ~200 tservers? (e.g. 200 tservers * 200 tablets)?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1454
17295	ACCUMULO-1454	bq. Would that just bash ZooKeeper trying to migrate tablets off of ~200 tservers? (e.g. 200 tservers * 200 tablets)? No more so than start-up. bq. Would you consider this a FATE op Yes: it needs to be part of the metadata processing state machine. Migrations are not presently a FATE op.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1454
17296	ACCUMULO-1454	Is the upgrade case the same as the 'change configuration' use case? Why load/unload instead of move?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1454
17297	ACCUMULO-1453	One of the usual suspects for failed loads is walog recovery problems. The issue w/ RFiles mentioned in the issue description seems more tricky to isolate. If a tablet has a problematic file, the tablet will likely load successfully. Failure will occur when a scan of the rfile is attempted. When a tablet server fails, how do you know which tablet(s) caused the problem? Another approach to solving this issue may be to identify what can cause tablet server failure and try to defend against those. One possible cause could be key/value in a rfile that exceeds memory. This would be easy to defend against by making Accumulo refuse to load key/values that are too large. Another possible cause is an iterator that runs amok and consumes all memory. This is harder to defend against, ACCUMULO-1188 is one approach.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1453
17298	ACCUMULO-1452	Should the fix version for this include 1.4.5 and 1.5.1?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1452
17299	ACCUMULO-1444	[~sonixbp] I don't really understand what the title means. Can you expand here?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1444
17300	ACCUMULO-1444	My apologies for the late reply. Christopher is correct. On Tue, May 26, 2015 at 5:48 PM, Christopher Tubbs (JIRA) <jira@apache.org>	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1444
17301	ACCUMULO-1442	[~billie.rinaldi] - JLine2 is BSD Licensed. Google tells me that is Apache friendly, but I can't find an Official statement on it. Can you point me at something that definitive?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1442
17302	ACCUMULO-1442	Can somebody on a Mac test [^ACCUMULO-1442-v3.patch] and let me know if there are any issues?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1442
17303	ACCUMULO-1438	Umm, is this something we want to go moving around mid release cycle / this early into trunk? I thought we were trying to avoid tree conflicts.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1438
17304	ACCUMULO-1438	John, I'm sorry, I'm still getting used to our merge plan. Did I mess something up?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1438
17305	ACCUMULO-1438	That's what I was thinking as well. I should have confirmed it with the community first, but it seemed wonky to introduce that change in a future version and I don't want to split packages over different jars because that breaks OSGI environments. In the future, if I have a change to 1.5 and 1.6, should I wait to do the merge into 1.6? I'm still not completely clear on the plan there and I've noticed many others doing the merge from 1.5 into trunk. I need to add the new module to the assembly too so I reopened the ticket. Ill remove the rat plugin as well since there's no special includes to add. Sent from my iPad	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1438

#	Requirement	Questions	Answered	Successfully Answered	URL
17306	ACCUMULO-1438	bq. In the future, if I have a change to 1.5 and 1.6, should I wait to do the merge into 1.6? I'm still not completely clear on the plan there and I've noticed many others doing the merge from 1.5 into trunk. Its in some mailing list thread. We decided to hold off on major moves in trunk until after 1.5.1. The expectation is that we will find a lot of bugs that need to need to be fixed in 1.5 and merged forward. The plan is to apply bug fixes in 1.5 branch and merge them forward to trunk. We had a feature freeze on jan 25 for 1.5, but now its almost june and we still have not released 1.5. IMO we (myself included) need more discipline about making only necessary changes to 1.5. The goal should be to release 1.5, not continually improve it.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1438
17307	ACCUMULO-1426	Which documentation are you referring to?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1426
17308	ACCUMULO-1419	Hadoop has a 2.1.0-beta release, has anybody on our side done due diligence w.r.t API and code stability?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1419
17309	ACCUMULO-1419	Did you update the jenkins jobs?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1419
17310	ACCUMULO-1419	bq. Did you update the jenkins jobs? Nope, I didn't. Good call. Edit: Done	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1419
17311	ACCUMULO-1419	Can you point me to said warnings? I don't know what you're talking about.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1419
17312	ACCUMULO-1417	[~ecn] - looks like this made it into 1.5.0? Can we close the issue out?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1417
17313	ACCUMULO-1409	Will this add another bit of complexity? The single node accumulo instance is intended to what amount of entries? At what size does the having the native map truly affect performance? And to what degree? One billion entries ... Fifty Billion entries?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1409
17314	ACCUMULO-1409	bq. At what size does the having the native map truly affect performance? Its used to sort incoming data. Sorting data w/ C++ is faster than Java. A difference would be observed if you started writing to an empty Accumulo instance w/ native maps. bq. At what size does the having the native map truly affect performance? The performance of native maps should be invariant with data size. However sorting incoming data is only one part of what Accumulo does. Accumulo eventually has to do compactions, which have nothing to do with the native map. So I suspect you would see the largest performance increase from native maps when Accumulo is empty. I am thinking Amdahl's law kicks in as more data is written, compactions start and now native maps are only one part of the system thats processing data. It would be interesting to run experiments w/ and w/o native maps for 10M, 100M, 1B, and 10B entries.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1409
17315	ACCUMULO-1409	If bin/accumulo mini is used to start a Single Node Accumulo, the native maps should work out of the box (though the user will have to override the tserver.memory.maps.native.enabled property in the MAC's site config). Are we interested in seeing if native maps may help us in our pursuit to speed up the MAC during the automated integration tests?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1409
17316	ACCUMULO-1409	bq. Are we interested in seeing if native maps may help us in our pursuit to speed up the MAC during the automated integration tests? I suspect enabling them would not help for that case. Not much data is written. I think a lot of the time is spent in process startup and IPC snafus (i.e. accumulo init tries to talk to zookeeper before its fully up, it fails and then retries in a bit).	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1409
17317	ACCUMULO-1409	bq. the only way I can guarantee the integration tests don't time out is if I enable the native maps with "-P native". Interesting, I wonder if this is because JavaGC is avoided and/or the native maps are faster at sorting. So native map support has recently been added to MAC. I have taken a quick look at the code, but not recently. It seems like native maps can be used when Accumulo itself uses MAC. However what about the case where an end user uses MAC? Can this be supported? It seems like supporting this would require putting jars maven repos that contain the shared libs.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1409
17318	ACCUMULO-1406	Should the command error/fail if the user specifies -scan and -all? This may indicate this user did not type what they were thinking (i.e. cut, paste, and edit a command adding the -scan option). I don't think commons cli can do this for us. AFAIK, can not specify an option as mutually exclusive w/ a group of options.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1406
17319	ACCUMULO-1405	bq. There's a lot of blocks already in place with the Instamo stuff. I would not say the blocks are in place at this point in time. Maybe after ACCUMULO-1378 is complete, instamo could leverage that work. When a lot of the tickets under ACCUMULO-1386 are complete and its easy to run a single node accumulo, how do we package that and make it available to users? Keep in mind that users will want to stop and start this instance, its not transient. Users will also want to configure it. Maybe maven is a way to do this, I am not really sure at this point. Seems like it would be something different than instamo, maybe a maven plugin for managing a single node accumulo instance. Will this work w/ native maps? Another option is creating a tarball, rpm, and deb. I think it would be useful to develop a list of the pros and cons of each approach. I agree w/ [~medined] we do want to be cognizant of the maintenance tail of whatever we create. We will have to continue to support in 1.7, etc.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1405
17320	ACCUMULO-1405	I just did an example assembly that copied all the dependencies (including provided) and packaged up the MAC as a shade jar. It was 32mb and that doesn't seem realistic to release inside the main tarball (which is... 11mb). I like the idea of having _developers_ pull down the dependencies on their own using a script in the tarball. We've also mentioned _non-developers_ using it to populate some data quickly for (possible) migration over to a fully-distributed cloud. In that latter case, can we guarantee that their system have maven installed or even connectivity to the internet? I know there must be downsides as well, but what if a user could do this: * untar accumulo-mini-1.6.0-bin.tar.gz * cd accumulo-mini-1.6.0 * ./bin/accumulo-mini -p propsFile	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1405
17321	ACCUMULO-1405	[~sonixbp], I have been thinking about a accumulo-mini-1.6.0-bin.tar.gz distro, from the perspective of a user. Why can't I run ./bin/start-all.sh and ./bin/stop-all.sh? Why don't I run init? Why do I configure tserver memory in a different place (props file vs accumulo-env.sh)? These are rhetorical questions. It seems that w/o working on the scripts (which I am not advocating for), this alternate distribution would present an entirely different experience. It also made me think about the monitor and gc, MAC does not start these. Do not really need to for unit test. Probably should start them for the single node use case. A maven plugin to start and stop a single node Accumulo instance and script in contrib to pull down deps into lib/deps seem like a good way to go.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1405
17322	ACCUMULO-1405	Now that you mention it, it doesn't. I would love to have a "mvn accumulo:run" mojo. That would be a HUGE win. Can we achieve this with your current StartMojo/StopMojo or can we plug in the MiniAccumuloRunner to kill two birds with one stone? Do we have a ticket for it yet?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1405
17323	ACCUMULO-1399	Personally, JEXL was the first thing that came to my mind. I was just thinking it would be neat if there was a feature that would allow you to create an alias that points to some file of commands. Maybe when creating the alias, you specify a file of commands and it copies it to some directory that can be recalled later. bq. http://www.beanshell.org/ Isn't that quite old and unsupported these days?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1399

#	Requirement	Questions	Answered	Successfully Answered	URL
17324	ACCUMULO-1399	{quote} The shell was originally designed to support pluggable commands. However, it was decided against making this a user-facing feature because of the confusion it might cause distinguishing between "official" features, and commands users might grow accustomed to on a particular customized installation (and because nobody had much interest in maintaining other users' commands that behave badly). {quote} since this was already thought of and decided against, should I abandon this idea? I'm thinking the answer might be yes, based on the above comment and the move to a CLI.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1399
17325	ACCUMULO-1398	Attached patch for review. Apply to trunk, here are the command options: dumpconfig -a dumpconfig -s dumpconfig -t t1,t2,t3 dumpconfig -s -t t1,t2,t3	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1398
17326	ACCUMULO-1397	[~mberman], are you still working on this? If so, feel free to assign it to yourself. Also, can you upload a patch file or open a review board when you are done? Having to get multiple {{.java}} files is a lot more cumbersome. Thank you!	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1397
17327	ACCUMULO-1395	[~John McNamee], would you be down for making some documentation updates for these changes? Removing the example configurations is a big change for users -- it would be good if we have something we can point them to that describes what was changed and how to use it. A new issue would be good to track that.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1395
17328	ACCUMULO-1395	Why are we suddenly adding new improvements on 1.6.0? Why did you commit this to 1.6.0, [~ctubbsii]?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1395
17329	ACCUMULO-1394	It does extend RegExFilter but it's in a different package than Filter. Does protected work in sub-packages?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1394
17330	ACCUMULO-1394	Is the link between jira and the code changes broken? On Thu, May 16, 2013 at 2:03 PM, Christopher Tubbs (JIRA)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1394
17331	ACCUMULO-1391	Is this a change to the MiniAccumuloConfig API or a completely new class altogether?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1391
17332	ACCUMULO-1390	Is this a duplicate of ACCUMULO-1380 or is this more specific to the features added in 1.6.0 that allow the MAC to be run as a single node development environment?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1390
17333	ACCUMULO-1390	bq. is this more specific to the features added in 1.6.0 that allow the MAC to be run as a single node development environment? Thats what I was thinking. Also, if its really easy to use, it may be used for more than development. I wonder if we will encounter the situation where a user starts with SNA then ask how to transition the data in it to a cluster.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1390
17334	ACCUMULO-1385	Changing global OS settings seems like an odd thing for an RPM to do. If a lot of RPMs did this, it seems like the order in which RPMs were installed could change a systems behavior. Is this a common things for RPMs to do? If so, is the installation order issue addressed in some way?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1385
17335	ACCUMULO-1385	bq. An example of an RPM that does add its own modular config to /etc/sysctl.d I did not even notice "/etc/sysctl.d/accumulo" in the summary. Putting it in /etc/sysctl.d resolves my concerns. Following this line of thought, should we up nproc and nofile in /etc/security/limits.d? It seems like adjustments to open file limits would need to apply to HDFS users more than the accumulo user, so that may be tricky.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1385
17336	ACCUMULO-1385	{quote}...should we up nproc and nofile in /etc/security/limits.d?{quote} It is my understanding that limits are security policies for user login sessions, and they don't affect daemons, so no, not unless we plan on these values affecting client code (in which case, they should be part of the client RPMs/DEBs).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1385
17337	ACCUMULO-1381	Would it be better if it took a URI instead of just a path that makes assumptions about places it could check? file:///path/to/file	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1381
17338	ACCUMULO-1380	[~ctubbsii] I'm finishing this up now. Is it too late to incorporate this into the RC?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1380
17339	ACCUMULO-1380	{quote}I'm finishing this up now. Is it too late to incorporate this into the RC?{quote} Too late for RC2, but if that fails, it can go in RC3. Don't let that stop you from contributing it to the 1.5 branch, though. It can go in 1.5.1 if RC2 passes a vote.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1380
17340	ACCUMULO-1378	The ability to get up and running with a single node Accumulo instance in a few minutes would be extremely useful. Setting up hadoop, zookeeper, and then Accumulo for a single node instance takes a while. MiniAccumulo is one option for achieving this. I think this will lead to adding complexity to MiniAccumuloCluster. For example people will want to be able to configure the amount of memory tservers use and make tservers use native maps. Maybe this is worthwhile because of the benefit. What other options are there?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1378
17341	ACCUMULO-1378	Also, is the goal really to completely replace Mock Accumulo?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1378
17342	ACCUMULO-1378	bq. Decomposing the core methods of the MAC into helper classes may give us more bang for our buck. [~sonixbp], are you proposing reorganizing the implementation of MAC or API changes? It seems we should rename this ticket to something like "Make it easy to run a single node Accumulo instance."	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1378
17343	ACCUMULO-1378	bq. are you proposing reorganizing the implementation of MAC or API changes? I'm referring to reorg of implementations for better code reuse- not API changes. You had me thinking about having a SingleNodeAccumulo that was different from the MiniAccumuloCluster. If we did that, many things would remain the same in both- processes get spun up, ports get configured, LogWriter gets created, shutdown hooks get registered, and vmargs optionally get attached to the processes for remote debugging. I've been teetering back and forth about this. On one hand, if the only difference between the two are the ability to re-use a directory/configuration, that doesn't seem to me like enough of a difference to separate them. On the other hand, if we want to treat one as a quick integration test environment and the other as a full development environment then we can define a broader set of features that differentiate the two. The latter seems like grounds for separation.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1378
17344	ACCUMULO-1378	bq. I've been teetering back and forth about this. [~sonixbp], could proceed with making changes to MAC to support single node Accumulo for now. Later on if we see good reasons for creating SingleNodeAccumulo, we can do that. bq. I'm ok with marking MockAccumulo deprecated, but not ok with removing it until MAC is "as fast". [~elserj], would you still be concerned about MAC's speed if ACCUMULO-1030 was implemented?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1378
17345	ACCUMULO-1378	bq. Josh Elser, would you still be concerned about MAC's speed if ACCUMULO-1030 was implemented? I think so. ACCUMULO-1030 seems to deal with a different subject, imo. To be clear, I'm just against _deleting_ MockAccumulo because I don't think we have an adequate replacement yet. There are known issues where MockAccumulo does things wrong; however, there are plenty of things it does right. As such, I don't see a reason to make other people _force_ to something new so soon after MockAccumulo was even introduced. I have no qualms against a strong recommendation to use MAC instead of Mock and a disclaimer that Mock may not be 100% accurate in implementation.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1378
17346	ACCUMULO-1377	Is this a plan to do the real fancy one mentioned on the mailing list or just fixing the issues with some buggy versions of browser from treating a link ending in tar.gz as a download?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1377

#	Requirement	Questions	Answered	Successfully Answered	URL
17347	ACCUMULO-1376	[~chentecaliente], functionally, the patch changes look good. A couple of small things: # What branch is this patch based on? # Make sure you use (or follow) the [codestyle guidelines|http://accumulo.apache.org/source.html]. Most notably, 2spaces instead of a tab character. # Could you add a test for this while you're making these changes? (1.5 ShellServerTest, 1.6.0+ ShellServerIT)	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1376
17348	ACCUMULO-1376	Thanks for the comments Josh. 1) The patch is based on 1.6; however I imagine it can go back further. 2) I will take a look at the codestyle guidelines and make sure my IDE conforms to that. 3) I saw the ShellTest and didn't see a good way to add a test there, but did not see ShellServerTest/ShellServerIT so I didn't attempt to write a test there. I will write a test in ShellServerIT for 1.6, unless you think I should try to patch 1.5. Also, Is there documentation on the process to follow for submitting patches? I kind of just figured this out and I'm not sure if I did it properly. Thanks again Josh	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1376
17349	ACCUMULO-1375	bq. My last note - does thrift really need to be installed? IIRC, yes. You would need the language specific library for thrift installed to be able to use said thrift client code in that language (you need the python thrift library installed to use the python with the proxy)	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1375
17350	ACCUMULO-1375	SVN#1478618. I updated the proxy/README file but feel it should be reviewed before this ticket is resolved. Can someone please take ownership of this ticket?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1375
17351	ACCUMULO-1375	bq. Can someone please take ownership of this ticket? got yer back.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1375
17352	ACCUMULO-1368	We may want to come to a decision about whether or not we want the MiniAccumuloCluster to be used for both integration tests AND as a quick-start development environment. Supplying a main method is simple but we should consider the packaging- is there going to be an option in accumulo-start's Main class? Will there be a different script for firing it up? Is it up to the user to jam this into a maven module with the necessary dependencies and call the main() method? Is a maven plugin going to be the sole caller of the method?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1368
17353	ACCUMULO-1368	I like how the proxy server main method takes one option, the name of a config file. I am thinking MAC main should do the same. bq. e an option in accumulo-start's Main class? I think this would be really nice to have. USers would not have to type the full class name. bq. Will there be a different script for firing it up? If a user can do "accumulo mini -p mini.props", would any other scripts be needed? bq. Is a maven plugin going to be the sole caller of the method? I think it makes sense to be able to call it via a maven plugin and the accumulo script.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1368
17354	ACCUMULO-1368	bq. Because we're relying on Hadoop & Zooekeeper's classpaths to provide many of the dependencies that we need to run the tserver, master, and init processes, using "accumulo mini" will only work if the two are installed. Good point, I was not thinking of that when saying we should add it to accumulo-start main. Now I understand your comment about packaging more fully. Are you thinking that launching via maven the only option, unless a single node accumulo package is created?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1368
17355	ACCUMULO-1368	bq. Are you thinking that launching via maven the only option, unless a single node accumulo package is created? I'd love to be able to run the MiniAccumuloRunner using the start.Main class. I can see that by omitting the commons and other dependencies from the lib directory must be saving a ton of space but it seems to be causing other issues as well- like some of the required dependencies missing from some versions of Hadoop. Are there any other reasons why we are not shipping many important dependencies with the assembled package? The current MiniAccumuloRunner is able to assume defaults so that a property file argument can be optional. It would be absolutely wonderful for running it to be as simple as 1) extract tarball 2) run {noformat}${accumulo_home}/bin/accumulo mini{noformat}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1368
17356	ACCUMULO-1367	Applied! Thanks for the patch, [~sonixbp]. Can you please do me a favor a double-check what I [committed|http://svn.apache.org/viewvc?view=revision&revision=1479227]? I had to massage your patch a little (that [~kturner] changin' packages), but it's probably fine.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1367
17357	ACCUMULO-1366	Can the problem be exposed by JMX? If so, the source (the iterator) is isolated from the reporting (i.e. aggregating)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1366
17358	ACCUMULO-1364	Did you determine if this was an HDFS bug?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1364
17359	ACCUMULO-1364	Your redundant file system wasn't redundant? Yeah. Oops. If we're misusing the dfs api, sure, we need to fix that; but, I don't see "Hadoop lost data!" as an Accumulo problem. Did you figure out what was happening at the dfs layer with the offending blocks?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1364
17360	ACCUMULO-1364	bq. My open question is whether we should hold the release of 1.5.0 until we can diagnose (or fail to replicate). My decision would be based on how much time is wanted to investigate. Obviously we're not there yet, but if this is going to be a few weeks or a month, I wouldn't want to wait. bq. our system clearly doesn't meet the level of reliability that we claim it meets I didn't think we advertise any redundancy above what Hadoop provides (in talking 1.5), so I don't really see that as false advertising (to put words in your mouth). By that measure, 1.4 was less redundant because we had only two copies of a WAL instead of the Hadoop default of 3. My view on this is that if you don't have the ability to say "oops, gotta reprocess" when faced with catastrophic, power failure, you should probably have a UPS to give you enough time to issue an orderly shutdown. Yes, it would be nice to figure out exactly what happened, but I know I don't have the knowledge/expertise to fully track the down the issue (nor the ability to look at your nodes to figure out what happened), and I'm not going to volunteer Eric (or anyone else, for that matter) to try and guess. Is someone other than just John looking into this (getting back to your 'should we delay 1.5' question).	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1364
17361	ACCUMULO-1364	Couple of questions: 1) The logs that are corrupt, were they being written to actively when the power went out? 2) Are you testing with a current version of 1.5 or with the revision noted above? 3) Josh's question: how much time are you asking for?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1364
17362	ACCUMULO-1364	Looking through open HDFS tickets. Has anyone seen this [1]? It's not fixed, does that mean its still an issue, or maybe OBE? [1] https://issues.apache.org/jira/browse/HDFS-1944	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1364
17363	ACCUMULO-1364	Actually, the old loggers were thoroughly, though unintentionally, tested with power failure. At scale. More than once. In two weeks I could make this configurable, and users could make their own decision. But I would rather patch HDFS. I reproduced log failure on a VM this evening. The datanode just doesn't do anything to disk on a sync. [~billie.rinaldi], can you dig up an HDFS expert at Horton works who might know when/if this is fixed?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1364
17364	ACCUMULO-1364	Have we tried the same VM reset / plug pulling with 1.4?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1364

#	Requirement	Questions	Answered	Successfully Answered	URL
17365	ACCUMULO-1364	bq. Today, my client said (and I paraphrase) "Accumulo lost data? That's a blocker." No, Hadoop lost data. Taking what Eric says sounds like Accumulo closed a file in HDFS and data was not actually sync'ed to disk. bq. So, if you are using XFS and your system goes down hard, then you might lose data. "You mean having delayed write back might cause my data to not be written?" No filesystem is going to magically save you if your data wasn't actually written. How far are we going to go in regards to a user-space application on top of a user-space distributed filesystem to what happens in the kernel on one node to write bytes to disk (ignoring the fact that even that does not guarantee you have bytes on spindles and not just disk cache). I certainly don't hope this is going to go the way of "Accumulo requires ext3 with data=ordered". This discussion seems to be barking up the wrong tree to me. I'm glad Eric has been able to reproduce this at an HDFS layer (and I'm sure he'll work towards trying to get a fix there), but isn't a better solution here to make sure Accumulo has the means to work around this? The general consensus seems to be that people apparently think Accumulo should be resilient despite unreliable power. Perhaps I can shift discussion to that: are there things that Accumulo _could_ do on its own?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1364
17366	ACCUMULO-1364	Well, that makes me sad. At least we know now it's an issue throughout the chain and it's on our radars now. Out of curiosity, did it break the same way even though there were no appends? Or was it a different failure?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1364
17367	ACCUMULO-1364	What do you have in mind for testing? Just validating your results or something else?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1364
17368	ACCUMULO-1361	I noticed a problem with my patch anyways. Is this still something worth working on?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1361
17369	ACCUMULO-1360	Did this get fixed in 1.5.0?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1360
17370	ACCUMULO-1357	Thanks again [~sonixbp]! Looking at patch #1, I think enabling debugging should be a method on MAConfig. If its a method on MACluster then it should throw illegal state exception if called after start(). By putting it in the config object, it makes it more clear that it can not be enabled after start() it called. IMO ServerType should be in the mini package, its part of the MAC API. For setting memory, should we make that more strongly typed and less error prone? One way to do that is to use the Java TimeUnit convention. Maybe something like the following : {code:java} enum MemoryUnit { BYTE, KILOBYTE, MEGABYTE, GIGABYTE, etc } class MiniAccumuloConfig { . . . public MiniAccumuloConfig setMemory(ServerType, long memory, MemoryUnit unit){} } {code} Maybe this is not that useful if this usually ends up coming from a config file. If we do not do something more stronly typed, then we should at least validate the String passed into the set method immediately so that it fails fast.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1357
17371	ACCUMULO-1357	[~sonixbp]. I committed patch #2. I made some subsequent change in commit 1480705. Can you take a look at those? I noticed the methods relating to getting bytes were not public. When changing them to public, I thought that making them return a long would be more consistent with the setters than returning a string. I also change them names of the memory related getters and setters to make them more consistent. I was thinking the setDebug() and isDebug() names should be named somethng different. Something more specific that distiguishes from other types of debugging, like log4j debug level. Maybe something like setJDWPEnabled() and isJDWPEnabled(), those are much more precise, but kinda unsightly.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1357
17372	ACCUMULO-1354	Would this patch eliminate the need to do something like ACCUMULO-1402? If so, I'd be in favor of promoting this over that ticket. For the record, I have absolutely zero objection to using profiles for test dependencies, if that's what it takes.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1354
17373	ACCUMULO-1354	Oh, ok, I guess I could add the profiles back into the top-level pom. If they're there anyway, do you think I should put hadoop-tools and hadoop-distcp in them?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1354
17374	ACCUMULO-1350	Good point. Does shell --fake not currently work?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1350
17375	ACCUMULO-1349	Verified this with "mvn integration-test" Looks like it works well. Should we update jenkins to run "integration-test" phase by default?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1349
17376	ACCUMULO-1342	Why are giving this to meee? (Said as if I was the Doctor from Lost In Space)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1342
17377	ACCUMULO-1337	Can you please add some unit tests for this? And perhaps add comments in a javadoc explaining context - where and why would this iterator be helpful?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1337
17378	ACCUMULO-1337	Pushpinder, thanks for the patch. Some unit test would be nice. I do not think the continue case is correct. After an Accumulo client has received a batch of key values, it will reseek with the last key in the batch non-inclusive. So I am thinking the following code should not test the case 'sk.getColumnFamilyData().length() == 0'. The wholerowiterator always returns 0 len column families. This iterator does not do that. {code:java} if (sk != null && sk.getColumnFamilyData().length() == 0 && sk.getColumnQualifierData().length() == 0 && sk.getColumnVisibilityData().length() == 0 && sk.getTimestamp() == Long.MAX_VALUE && !range.isStartKeyInclusive()) { {code} Could the WholeRowItertor be generalized? Maybe create a more general version of the whole row iterator, and have the whole row iterator extend that for backwards compatibility.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1337
17379	ACCUMULO-1337	I justt ok a look at patch v1. * class javadoc should go before class, not before imports * maybe rename static function decodeRow() to decodeColumnFamily()? * should probably implement OptionDescriber... unless the configuring an iterator in the shell no longer requires this. I noticed the WholeRowIterator does not implement this also. * decodeRow()/decodeColumnFamily() should really have javadoc, since its user facing... this appears to be an issue w/ the WholeRowIterator * We have started adding since javadoc tags... this entire class could have a @since 1.6.0 tag in the javadoc * should the javadoc for filter change? seems its still oriented twoard rows? * might consider a unit test for deepCopy() Curious about the history behind testBug1() was this something you ran into w/ using the iterator w/ multiple tablets? At first the test threw me off because I did not notice the MultiIterator was narrowing the range. I looked at the diffs between the WholeRowIterator and WholeColumnFamilyIterator. The code for both are so short and the diffs significant enough that I am not sure if it makes sense to generalize the code. It seems like it would only make sense to do this if it makes maintenance easier and reduces bugs. If creating a generalized super class is more complex and makes maintenance harder, then its probably not worthwhile. What do you think?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1337
17380	ACCUMULO-1336	+1. Are you thinking of just the typo.encoder package with unit tests?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1336
17381	ACCUMULO-1336	bq. Are you thinking of just the typo.encoder package with unit tests? yeap, thats what I was thinking.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1336
17382	ACCUMULO-1336	Keith, do you have thoughts on which the lexicoders will live?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1336
17383	ACCUMULO-1336	bq. Keith, do you have thoughts on which the lexicoders will live? I was thinking somewhere under o.a.a.core.client, but do not have a specific sub package in mind.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1336
17384	ACCUMULO-1336	Would you have a problem with me taking this on?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1336

#	Requirement	Questions	Answered	Successfully Answered	URL
17385	ACCUMULO-1335	This could actually be a pretty simple change. I pulled the logic in the printDiskUsage() method up to a "getDiskUsage()" that returns the Map<TreeSet<String>,Long>. This isn't the prettiest thing to return in a client API. I supposed maybe a "DiskUsage" object that has accessors for the tables and sizes? What do you guys think?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1335
17386	ACCUMULO-1335	I took a quick look at the patch. It sounds like there may be a second patch, so I did not look at in detail. The javadoc below is incomplete. But if the return type will change, probably does not matter. {code:java} @return a map keyed by a set of table names where the value {code} Did you mean Configuration object? in the comment below? Check out org.apache.accumulo.core.util.CachedConfiguration. Eric created this a long time ago. He found that when a tablet server was loading lots of tablets, loading and parsing the hadoop config for each tablet was actually slowing down Accumulo startup. {code:java} // TODO: Refactor so that a connector isn't created each time. {code} Should the new method in the API throw TableNotFoundExcep?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1335
17387	ACCUMULO-1335	Just to make sure I'm following- A client using the java API should be able to call connector.tableOperations().getDiskUsage(Set<String> tables). The getDiskUsage() method in the TableOperationsImpl will call a getDiskUsage(String table) method in the TabletClientService. The TabletServer's thrift server implementation of TabletClientService.Iface will use the IDs of the tables, call out to the FileSystem.globStatus(new Path("/accumulo/" + tableId), and grab the size for the table(s) it's responsible for unless a failure occurs, at which point the tableOperations().getDiskUsage() method will pick a different tablet server and repeat the process for calculating the size. Is this what you are proposing?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1335
17388	ACCUMULO-1335	[~sonixbp] I just got a chance to look at your 2nd patch, it was nice thanks. I just committed the following changes. * return thrift connections in a finally block * do not retry on TApplicationException (extends TException) ... thrift will throw this if the server side code throws an unexpected Exception like a NPE.. not sure, but I think if a TException is thrown on the server side it will result in a TApplicationException on the client side... I should test that, because thats what I am expecting in the change I made * retry on TTransportException, this indicates a I/O error * moved the thrift calls from TabletServer to ClientServiceHandler .. there is not a great reason for this, it was just easier to reuse some existing code on the client side that randomly picks a tablet server. ClientServiceHandler exist for historical reasons. It used to be that the master or tablet server would service those methods. Then at some point we decided not burden the master w/ those methods. * checked if the user can read the tables in a more standard way. * One of the test you added went directly against the tablet server thrift API. I moved this to go against client API, because that seemed to test more code. Was there a specific reason for going straight to the tablet server?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1335
17389	ACCUMULO-1335	bq. Was there a specific reason for going straight to the tablet server? I could have just written the entire test in TableOperationsIT but it seemed reasonable to test the thrift service separately- just in case something small changes in that layer, it would be easier to isolate any problems that way. bq. retry on TTransportException, this indicates a I/O error I should have looked these up. I'm still getting used to thrift. I figured anything that threw an exception that's not an Accumulo-specific exception would warrant a retry- worst case is the exception occurs on all tablet servers and then we decide we can't fulfill the request. Probably not the most optimal approach.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1335
17390	ACCUMULO-1334	Hey Corey... can you merge your code with server/monitor/util/celltypes/NumberType.java and move it to core/util? That way we only have one mechanism for formatting large values. Plus, you can improve the code with your Math.log() trick.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1334
17391	ACCUMULO-1329	Was the README.mapred fixed? What specifically isn't correct?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1329
17392	ACCUMULO-1327	could we use the maven exec plugin to run the python markdown utility during a phase of our choosing?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1327
17393	ACCUMULO-1327	bq. could we use the maven exec plugin to run the python markdown utility during a phase of our choosing? Adding external dependencies into the build process makes me a sad developer. Even ones as benign as python.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1327
17394	ACCUMULO-1327	Does the python markdown stuff work with jython? if so we might be able to swing it with just maven plugins.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1327
17395	ACCUMULO-1321	Any update? Also, can you give details as to the configuration of the system? There should also be some output from the vfs related code in the tserver debug logs.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1321
17396	ACCUMULO-1321	I modified the unit test to use a jar w/ a class file thats different and it did not work. I have been deep in the VFS code trying to understand why. I think I have it figured out for the unit test. The VFS code creates a wrapper vfs filesystem for a jar/zip, which wraps a java.util.zip.ZipFile. Even after the file is deleted and recreated, vfs still references the old zip file (the java zip code keeps an open file handle to the zip file, so even though its deleted it can still read it). So the new classes in the new jar are not seen. I was trying to figure out how to clear this internal VFS cache, then I started thinking this behavior may be desirable. For classloaders created before the file changed, its nice for them to continue referencing the deleted zip file. This will result in consistent behavior, where the classloader always loads classes from one instance of a zip file and not different zip files over time. I think the solution is to completely recreate the VFS object when creating a new classloader. Older classloaders will reference older VFS objects which will reference deleted zip files. I need to do further work to understand how this solution works w/ something like HDFS where jar files are copied to a local tmp dir and then opened using java.util.zip.ZipFile	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1321
17397	ACCUMULO-1321	what are the remaining issues? - cache dir per VFS - ACCUMULO-599	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1321
17398	ACCUMULO-1321	Did that include rolling back the various work arounds that were committed? -- Cheers ~John	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1321
17399	ACCUMULO-1321	bq. Did that include rolling back the various work arounds that were committed? No, it just builds on the stuff you committed.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1321
17400	ACCUMULO-1321	Should we put in a ticket to the commons-vfs project about this?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1321
17401	ACCUMULO-1321	bq. Should we put in a ticket to the commons-vfs project about this? What specific issue were you thinking of?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1321

#	Requirement	Questions	Answered	Successfully Answered	URL
17402	ACCUMULO-1321	rm old jars add new jar rename new jar in the ext directory Got the following stack trace {code} java.lang.ClassNotFoundException: blah.testIterator at org.apache.commons.vfs2.impl.VFSClassLoader.findClass(VFSClassLoader.java:181) at java.lang.ClassLoader.loadClass(ClassLoader.java:321) at java.lang.ClassLoader.loadClass(ClassLoader.java:266) at org.apache.accumulo.start.classloader.vfs.AccumuloVFSClassLoader.loadClass(AccumuloVFSClassLoader.java:102) at org.apache.accumulo.server.client.ClientServiceHandler.checkClass(ClientServiceHandler.java:259) at sun.reflect.GeneratedMethodAccessor184.invoke(Unknown Source) at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:43) at java.lang.reflect.Method.invoke(Method.java:616) at org.apache.accumulo.trace.instrument.thrift.TraceWrap$1.invoke(TraceWrap.java:63) at sun.proxy.$Proxy10.checkClass(Unknown Source) at org.apache.accumulo.core.client.impl.thrift.ClientService$Processor$checkClass.getResult(ClientService.java:2343) at org.apache.accumulo.core.client.impl.thrift.ClientService$Processor$checkClass.getResult(ClientService.java:2328) at org.apache.thrift.ProcessFunction.process(ProcessFunction.java:39) at org.apache.thrift.TBaseProcessor.process(TBaseProcessor.java:39) at org.apache.accumulo.server.util.TServerUtils$TimedProcessor.process(TServerUtils.java:156) at org.apache.thrift.server.AbstractNonblockingServer$FrameBuffer.invoke(AbstractNonblockingServer.java:478) at org.apache.accumulo.server.util.TServerUtils$THsHaServer$Invocation.run(TServerUtils.java:208) at java.util.concurrent.ThreadPoolExecutor.runWorker(ThreadPoolExecutor.java:1146) at java.util.concurrent.ThreadPoolExecutor$Worker.run(ThreadPoolExecutor.java:615) at org.apache.accumulo.trace.instrument.TraceRunnable.run(TraceRunnable.java:47) at org.apache.accumulo.core.util.LoggingRunnable.run(LoggingRunnable.java:34) at java.lang.Thread.run(Thread.java:679) Caused by: org.apache.commons.vfs2.FileSystemException: Could not get attributes "jar:file:///cloud/accumulo/accumulo-current/lib/ext/blah.jar!/blah". at org.apache.commons.vfs2.provider.DefaultFileContent.getAttributes(DefaultFileContent.java:248) at org.apache.commons.vfs2.provider.DefaultFileContent.getAttribute(DefaultFileContent.java:285) at org.apache.commons.vfs2.impl.Resource.getPackageAttribute(Resource.java:87) at org.apache.commons.vfs2.impl.VFSClassLoader.definePackage(VFSClassLoader.java:244) at org.apache.commons.vfs2.impl.VFSClassLoader.defineClass(VFSClassLoader.java:215) at org.apache.commons.vfs2.impl.VFSClassLoader.findClass(VFSClassLoader.java:177) ... 21 more Caused by: java.lang.NullPointerException at org.apache.commons.vfs2.provider.jar.JarFileSystem.getAttributes(JarFileSystem.java:87) at org.apache.commons.vfs2.provider.jar.JarFileObject.doGetAttributes(JarFileObject.java:112) at org.apache.commons.vfs2.provider.DefaultFileContent.getAttributes(DefaultFileContent.java:241) ... 26 more {code}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1321
17403	ACCUMULO-1321	bq. I disagree, this bug is still extant. We just did work which made it less probable, and this is evidence in 1.5.0 that it's still here. Are you going to change the affects version to 1.5.0 and the fix version to 1.5.1? This practice in general seems really confusing to me, this bug is refed in the 1.5.0 release notes tagged in svn.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1321
17404	ACCUMULO-1321	bq. Well, this is very similar to that case though. Its confusing for someone trying to understand what was done when. Should we change the description of the ticket to "This ticket covers two similar cases, one of which was fixed in 1.5.0 and the other which was fixed in 1.5.1 ..."? bq. Source code changed, new jar, and instead of copying it in, it's a delete, move, rename. This sounds like a very nice concise description for a new ticket.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1321
17405	ACCUMULO-1314	Few different options for implementation, need feedback. # Switch from Property to Map # Provide expectations for classes (or interfaces) for each property. # How do we expose these class expectations in the CLI and xml based token generators? # Do we make our own DestroyableMap? # Do we enforce property classes in the Map, if custom, or in the Token? Or elsewhere?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1314
17406	ACCUMULO-1289	Some comments on ACCUMULO-1289.patch There are way more than diffs that would have I expected between ProxyServer in 1.4 and 1.5. This is may not be an issue with this patch, but I noticed it while looking at this patch. If this not resolved, I would be reluctant to release the proxy in 1.4. I do not think we should release it for 1.4 and not support it. In its current state, patching bug fixes to 1.4 and 1.5 would be painful and error prone. Can anyone provide insight into this issue? ProxyServer is missing apache header. I suppose this was an issue with the previous patch. I had to reformat SimpleTest in 1.4 and 1.5 to get it to compare nicely. After doing this I noticed the following : * Why not use getRandomProtocol() in 1.4 test? I have actually found proxy bugs in 1.5 by changing the protocol. * One test uses a constant of 10 and the other 100. Why the diff. * While comparing SimpleTest in the patch, I noticed some bugs in 1.5 that I think your patch fixes? I just checked in a fix for those to 1.5. r1469503 The patch changed thrift IDL, but does not include regenerated thrift code. I generated it using thrift 0.6.1 to experiment with the patch.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1289
17407	ACCUMULO-1281	Do we want to do it after every run or every Nth? Or perhaps this makes for the case that the !METADATA table should have a smaller in memory map, but that sounds like a bad idea.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1281
17408	ACCUMULO-1262	Is this worthwhile keeping open?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1262
17409	ACCUMULO-1262	bq. Is this worthwhile keeping open? I don't think so, especially since it doesn't look like anybody is interested in pursuing an internationalized format for displaying numbers.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1262
17410	ACCUMULO-1256	Do we need a special state? Could we just have trashed tables be offline tables with a particular naming convention?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1256
17411	ACCUMULO-1256	bq. And perhaps all trash tables should be listed somewhere in the monitor, in a different table. I don't think it should be in the same table as Online and Offline tables. Yeah, maybe another page with a table showing how much space each table in the trash can is consuming and how many entries it has. I think space usage is the main thing a user would want to know about a table in the trash can. Is there anything else a user would like to know? This make me think that a user may want to delete a table in the trash can before it ages off. I suppose if delete table is called with the name of a table that is already in the trash can that it could go ahead and really delete it.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1256
17412	ACCUMULO-1256	bq. Do we need a special state? Could we just have trashed tables be offline tables with a particular naming convention? Offline tables can be exported and map reduced over. I think we would not want to support this for tables in the trash can. I am thinking tables in the trash can should be completely invisible to the rest of the API, except for when the user explicitly ask for a list of tables in the trash. So if someone tries to export a table in the trash can, they should get an exception. Exporting a table in the trash would not be useful, the table could be deleted while a distcp is happening.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1256

#	Requirement	Questions	Answered	Successfully Answered	URL
17413	ACCUMULO-1256	bq. Do we need a special state? Could we just have trashed tables be offline tables with a particular naming convention? Technically we could, but we already have a state model for the tables, it would be silly to break out of the model for a new feature. It could end up leading to odd state changes that we may inadvertently introduce down the road.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1256
17414	ACCUMULO-1256	Presumably there will be a new configuration property indicating how long to wait before deleting the tables. Do you think this should be global or per-table? Which process will handle actually deleting the tables once they expire?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1256
17415	ACCUMULO-1256	bq. Presumably there will be a new configuration property indicating how long to wait before deleting the tables. Do you think this should be global or per-table? Which process will handle actually deleting the tables once they expire? I think a global/master config option would be good. Maybe have the master do it. I have become very untrustworthy of time across nodes. For aging off fate operations, I made that happen within a master instance. An instance of the master keeps track of time for each complete FATE op that the client has not finalized. After 8 hours the master deletes it. If the master is restarted, then the stopwatch on each complete fate op starts over. If a master process does not run for 8 hours, it will never delete anything. This avoids the problem of time being off on different machines. It does not avoid the problem of time jumping on the node where the master instance is running. Could do the same thing for tables in trash, a running master keeps track of when each trash table should be deleted. If the timeout is one hour, then an hour after the master starts all tables that were in the trash when the master started would be deleted.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1256
17416	ACCUMULO-1256	I can see a case where a user will create a table, delete the table, create again a table of the same name, and delete it. In your design both tables of name "x" will be preserved in the trash because they are given unique names. I like your point about being able to call "du" on the table in the trash but do you have any ideas surrounding any other means of a user being able differentiate between the tables in the client API? Are you thinking that trashed tables may still show up to some capacity in the monitor?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1256
17417	ACCUMULO-1256	bq. I like your point about being able to call "du" on the table in the trash I just looked through TableOperations and did not see any other API calls that should work w/ a table in trash. If anyone else can think of any other exceptions, it would be nice to identify these now. bq. do you have any ideas surrounding any other means of a user being able differentiate between the tables in the client API? Do you mean if the user calls listTrash() and they see trash-foo-2013052201-01 and trash-foo-2013052202-01, how would they know which foo to undelete? I was thinking they would use the date. bq. Are you thinking that trashed tables may still show up to some capacity in the monitor? I think users will need an easy way to see what is in trash and how much space is used. This could be in the monitor, shell, or both. In the shell we could possibly add a flag to the du command to analyze space usage by tables in the trash. This would save the user the hassle of getting a list of tables in trash and calling du. What other capabilities users will need to manage this feature? It seems like a way to delete all tables in the trash would be useful, a way to empty the trash.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1256
17418	ACCUMULO-1256	Should we spec out the shell changes that are needed and add those to the design doc?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1256
17419	ACCUMULO-1241	{quote}Most non-java files have Apache headers.{quote} Yes, those headers were mostly added after this ticket was created. However, the question about whether the header should include copyright still applies to non-java files. When you say "borrowed", do you mean, a derivative work or dependency? In the case of a derivative work, it seems that the derivative work is our work, and as long as we properly credit the original work, we can follow our own standards, rather than follow theirs. (Maybe our standards should include our header, followed by a brief comment explaining that this work is derived from the original source whose header is as follows, then the original header?) If, on the other hand, we're simply using their work as a dependency, then our packaging is wrong, and we should add their work as a proper dependency (in a separate package). The problem I'm seeing is that when bugs are fixed and features are added, I see everything under "org.apache.accumulo" as our own work, because I don't necessarily know the history of it to know why a license header contains a different copyright date or different formatting standards for the header that exists. I don't necessarily know, for instance, that the header is intending to convey that the original work, from which the current version is derived, had that copyright date, but that the derived work has a newer copyright date. Nor would I know if the original work is copied/pasted in its entirety, with only the package name and the visibility changed from protected to public. I think some of these concerns can be alleviated if we were more strict about packaging dependencies as dependencies, and adding more thorough comments to explain why the header from the original work was preserved (in addition to our own header, as suggested above, not in place of it). As for maintaining the NOTICE file's last copyright date, I think we can add that as a filtered maven resource, so it is automatically updated with the current year, so it doesn't get out of date, and the same goes for the assembly/pom.xml, which can use the same property to keep that up to date.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1241
17420	ACCUMULO-1241	bq. Yes, those headers were mostly added after this ticket was created. However, the question about whether the header should include copyright still applies to non-java files. The headers should not include copyright information unless the files are from third parties, in which case we should not change the headers or add our own. See http://www.apache.org/legal/src-headers.html "Third party" means non-ASF, so for the code we've borrowed from other ASF projects we could standardize the headers. But again, I personally like knowing exactly which files did not originate with Accumulo. bq. When you say "borrowed", do you mean, a derivative work or dependency? I believe the bloomfilter and blockfile/cache packages have minor modifications, and flot is unmodified?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1241
17421	ACCUMULO-1237	bq. incorporating Keith's Github version into the codebase I was not advocating for incorporating the github version into 1.4. My intent was to point out its existence as something that can be used w/ 1.4 today. Is this patch based on the github version? It seems like the API does not match the 1.5 version. Need to make the public methods match w/ 1.5. Also, the patch does not follow the 1.4 directory structure conventions.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1237
17422	ACCUMULO-1237	Keith, Originally, I had the MiniAccumuloCluster in a src/test module. Then I realized that 1.5 had a /test directory structure that included many of the same scripts in 1.4's /test. For that reason, I moved everything to /test. Should I just create src/test?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1237
17423	ACCUMULO-1237	bq. Should I just create src/test? I think either create src/test or put the code in src/server. In 1.4, a lot of the test code is in src/server. Howerver, we would not want to change the package name if its in src/server.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1237
17424	ACCUMULO-1237	Keith- If I move the MiniAccumuloCluster to src/server, are you saying you want me to keep the package org.apache.accumulo.test or change it to org.apache.accumulo.server.test? Seems like it should match the rest of the packages in that module, right?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1237

#	Requirement	Questions	Answered	Successfully Answered	URL
17425	ACCUMULO-1237	bq. If I move the MiniAccumuloCluster to src/server, are you saying you want me to keep the package org.apache.accumulo.test or change it to org.apache.accumulo.server.test? Seems like it should match the rest of the packages in that module, right? Wherever it goes, the package name needs to stay the same as 1.5, so code written against 1.4.4 will work w/ 1.5. I suppose a new module in src/test would be best. If this is done it should make the dependencies in user poms align more nicely. For example if a user had the following in their pom for 1.4, then they should be able to just change the version for 1.5. {code:xml} <dependency> <groupId>org.apache.accumulo</groupId> <artifactId>accumulo-test</artifactId> <version>1.4.4</version> </dependency> {code}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1237
17426	ACCUMULO-1237	I took a look at patch #2. * Unit test did not run : java.io.FileNotFoundException: /tmpminicluster-86bb2ad0-5ae9-479f-8fd1-f257d1d57553/conf/accumulo-site.xml (No such file or directory) * if you are using eclipse, can you organize imports? * source code formatting seems incorrect * why not just do "loggerProcess = exec(LogService.class);" with no try/catch? * would probably be good to take 'appendProp(fileWriter, "logger.sort.buffer.size", "50M", siteConfig)' from instamo, but use the constant :	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1237
17427	ACCUMULO-1237	[~sonixbp] a few comments on patch #3. I noticed the unit test was using slf4j. I think most of the Accumulo code uses log4j. For consistency, I think it would be better to stick w/ one logging package. I like the message you are logging about the dir its running in, that could be really useful for debugging. Also the formatting is still kinda off. I notice this because I am diffing the 1.4 and 1.5 code. There are a lot of white space diffs that add a lot of noise. When I reformat the patch #3, I get few diffs between 1.4 and 1.5. This is nice for merging bug fixes between branches. How are you formatting the code? I am curious what the difference is. The patch looks good otherwise.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1237
17428	ACCUMULO-1237	bq. I notice this because I am diffing the 1.4 and 1.5 code. I didn't realize that's what you meant when you said it wasn't formatted correctly. I noticed that I was indenting to 4 spaces instead of 2 and I fixed that in this latest patch. bq. How are you formatting the code? I set intellij to format to 2 spaces instead of 4 and then I auto-formatted the files. I'll copy 1.4 and make the small modifications again- there's only a few.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1237
17429	ACCUMULO-1229	Do you know how to get the list of current keepers from a single keeper? I've not yet figured it out.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1229
17430	ACCUMULO-1229	Do you know how to ask zookeeper for the list of replicas? I do not.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1229
17431	ACCUMULO-1229	Option 4 seems like it would result in the following sequence of operations # 1 zookeeper server is passed in # Use 1 zookeeper server to find location of master # Ask master for list of zookeepers # Use this list to create new zookeepers connection This seems a bit odd. Why is making a client list all zookeepers a burden? A client knowing of only one zookeeper server seems like a less reliable way to use Accumulo. Operating this way unnecessarily introduces a SPOF.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1229
17432	ACCUMULO-1229	Would there ever be a need for ZooKeeperInstance to only connect to the zookeepers the user passed (and no others)? I can not think of a use case at the moment. Want to avoid the situation where we cause problems for users when we were just trying to help them. Another option to consider is not changing ZooKeeperInstance at all and providing utility methods for obtaining a complete list of zookeeper servers from Accumulo. A problem with this option is that it does not work with existing user code. If ZookeeperInstance itself is changed then existing code could benefit.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1229
17433	ACCUMULO-1228	For the first proposal, I think it might be useful to add to the API the ability to exclude columns or column families. For the second proposal, however, allowing the client to specify details of locality groups means making locality groups a client-viewable feature, instead of a server-side optimization. Users don't "fetch a locality group", they query for "data identified by (in this case) a set of column families", regardless of how it is stored. Blurring the lines between storage optimization and the data model is confusing and risky, I think it's a bad idea. Further, it's very poorly defined... would you use the locality group as determined by the current configuration, or the locality groups specified in the RFiles on disk prior to the last locality group change? After all, you can get 10 different files with 10 different locality group characteristics... and this works fine if you ask for the data, but it would be... confusing and unpredictable from a user's perspective if you ask for a locality group. This is a bit like asking "give me all data in my files stored with snappy compression vs. gzip".	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1228
17434	ACCUMULO-1228	Why even have the locality group defined that way in the first place then? It seems brittle if we require a client to apply labels to sets of column families (that maybe have to be mutually exclusive across lables?) and then never use them. How does the system handle querying today if a locality group is inconsistent across RFiles? I'd more prefer to have a consistent API for creation and use. If we don't allow a user to query based on locality group name, then we shouldn't have them specify it in the first place. Likewise, if we require them to specify it at creation time, then they should be able to query using it. Having one without the other makes it kind of useless.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1228
17435	ACCUMULO-1228	It would be super useful to have the column family fetch/restrict utility through the client api. This can very positively impact the performance of a query, especially if you can exclude all columns which you know you don't want to look into. bq. Locality groups are an admin feature, for optimizing the data storage for more efficient queries Why do you call them an admin feature? In the simplest form, it's nothing more than a group of columns that we "set aside". Pulling out my BigTable paper, they specifically say "Clients can group multiple column families togther...". As such, a locality group is losely defined as some group of columns that are "accessed together", which in my mind, is something a client would be aware of when issuing a query. I suppose I disagree with you comparing them to a codec. True, the client doesn't care about the codec used to compress the data just as the client doesn't care about the distribution of files backing the table(t), but there are implications for a client to understand the layout of their data and clients can use that knowledge to more effectively retrieve it. As for the argument about a locality group changing and potentially not being propagated to disk yet, the locality group is nothing but a convenience shorthand, allowing a client to fetch multiple columns with a single call. Sure, you don't get the optimization, but the API is still much more simple for the user.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1228
17436	ACCUMULO-1228	bq. I would almost go as far to say that I expect locality groups to be immutable. I would argue that making this change (encouraging scans against locality groups) would in fact make locality groups immutable. Anyone who understands this new client API would be afraid to make changes to locality group config because they can not predict the consequences. Is this what we want? bq. "why did #3 happen?" Its a contrived example to illustrate the point that locality groups can be easily changed. A possible driver for this change would be a new and important use case for which a locality group change would be beneficial. But actually, they probably would not have made the locality group config change because of fear of breaking existing code. So the new use case would not benefit from Accumulo's ability to change locality group config on the fly. .	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1228

#	Requirement	Questions	Answered	Successfully Answered	URL
17437	ACCUMULO-1228	bq. A possible driver for this change would be a new and important use case for which a locality group change would be beneficial. But actually, they probably would not have made the locality group config change because of fear of breaking existing code. So the new use case would not benefit from Accumulo's ability to change locality group config on the fly. Someone is still making the conscious decision here to alter the locality group. They could've made a new locality group instead of destroying the original, no? Actually, I'm a little fuzzy here. Say we have a table with columns [A,B,C,D,E] and LG1=[A,B]. Say [~billie.rinaldi@gmail.com] makes LG2=[C,D]. Now [~kturner] changes LG1 from [A,B] to [A,B,C]. Would my "column search space" for specifying LG1 be [A,B,C,D] because of the overlap of LG1 and LG2? What happens here after a compaction? Would LG1 and LG2 share a common "file" that contains C or would LG1 "contain" all of LG2 and vice-versa because of the overlap? Am I missing the joke here?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1228
17438	ACCUMULO-1228	{quote}I still don't agree that there's an issue for us to be concerned over with client code breaking after someone *knowingly* redefines a locality group.{quote} You have to consider who is doing this modification. This type of modification seems to me to most likely occur when you have different data types occupying the same table, and query patterns change over time, and an admin changes locality configuration to improve performance for those types of queries. The most obvious such transition is from no locality groups (everything in the "default" locality group) to 2 locality groups (1 named, 1 default). Tailoring configuration to optimize for different query loads over time seems like a system administrative function to me, and I don't think that performing this action should break everybody's code that has been written with the assumption that the locality groups are static, nor do I see a substantial reason to encourage such assumptions by exposing that behavior in the public API. Locality groups do *not* represent the data model and should not be queried as such. They represent query patterns, and an optimization for changing load requirements. Now, it is a trivial matter to make the additional assumption that the query load is congruent with the data model for users who know and accept all the risks and implications of doing so... but that case can easily be satisfied by storing some concept of a ColumnFamilyGroup in the application code, and using that as a source for both the maintenance functions (configuring locality groups) *and* the query functions (constructing scanners). Another trivial option to satisfy the same use case is a very simple utility class that reads the current locality groups, and overloads their purpose to also represent a set of column families over which to query. Such a utility comes with risks, though, and it could be confusing to avail such a thing in the public API. I think this sort of thing is best left in an obscure package with lots of javadoc admonishments, or in user/application code. {quote}Scan profiles sound like they could be really useful.{quote} +10, and we're halfway there with IteratorSettings, and iterator profiles in the shell. Another observation: I think the mapreduce API for setting the Set of columns over which to query might actually be more intuitive than our main appending "fetchColumn" and "fetchColumnFamily" methods in Scanner. Allowing a fetch method that gets a set/group of columns/families might would make it even more trivial to have a one-liner that reuses locality group info (or other column family group info) to configure a scanner.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1228
17439	ACCUMULO-1224	Maybe the right answer is to have a Factory definition for creating threads that can be backed by a thread pool. It would implement isOpen and close methods. And any external implementations, even if they wrap a thread pool, would have to decide how to "close", whether that means to do a shutdownNow, or wait for threads to finish, etc. Where would a user specify the BatchConfig? In the Instance when it starts? Maybe it is just a Hadoop Configuration object that is wrapped with methods to add the thread pool factory class name, etc. Btw, this is probably not the right place to ask this, but how come the Connector class is a class and not an interface? Seems like there was probably a reason for this? (Instance too)	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1224
17440	ACCUMULO-1224	bq. how come the Connector class is a class and not an interface? It's historical. It's on on its way to being an interface. First, we had to deprecate its constructors.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1224
17441	ACCUMULO-1223	Is this still valid?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1223
17442	ACCUMULO-1223	So, I actually don't even see slf4j-nop used in accumulo-start in master. I do, however, see slf4j-log4j12 as a transitive dependency of hadoop-client and hadoop-minicluster (it's in almost every hadoop artifact, actually... ; it'd be nice if Hadoop marked it as an optional dependency so it didn't propagate automatically.). Does this even matter, though, since it's just test output and it's being redirected to a file and safely ignored? (I guess that's sort of what I was getting at when I asked if it was still valid; I think this issue was created before we redirected console output in tests to a file) We could jump through hoops to exclude it from all our test dependencies, and add a test dependency on slf4j-nop, but I'm not sure what is to be gained from that (especially since we already have a direct dependency on log4j in accumulo-start; see ACCUMULO-3544).	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1223
17443	ACCUMULO-1219	The procedure here is to copy another RFile into the missing file's place, correct? Are there any cases where you'd want to try and find a version of the RFile that work? Would you ever want to simply delete references to a file?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1219
17444	ACCUMULO-1219	bq. Would you ever want to simply delete references to a file? If you have some aggregation on that table where the result is important and needs to be accurate, is one I can think of right away.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1219
17445	ACCUMULO-1219	Josh does have it pretty much covered - I'll work up some text that refers to that section if the missing file is in the metadata table. Question: How does one create an empty rfile? I have one that has been passed down from my grandmother's second cousin's aunt and has been in the family for generations, but how would I create a new one? I thought I could just create an new table, but that does not seem to generate a file. Is it possible using the shell (using 1.5.1standard dist) with: create table sample1 insert row1 colf colq value1 delete row1 colf colq flush This gives me something like: \-rw\-r\-\-r\-\- 1 hdfs supergroup 199 2014-04-06 09:51 /accumulo/tables/2/default_tablet/F000000q.rf Or should it be done using AccumuloOutputFormat?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1219
17446	ACCUMULO-1219	[~ctubbsii], I don't see that method anywhere. Are you suggesting that such a method should exist? We're just looking for an easy way to document how an empty RFile could be created. The shell approach should work, but it "technically" isn't empty (because it still contains that delete). That's probably acceptable as a first stab with a caveat to make the delete for something bogus (not that you accidentally delete a record in the table you're trying to recover). I haven't found a high-level command that can create a purely empty RFile yet.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1219
17447	ACCUMULO-1219	In the interests of getting something together quickly that people can use without too many acrobatics, would people be fine with adding a CreateEmpty utility to go along with PrintInfo and SplitLarge?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1219

#	Requirement	Questions	Answered	Successfully Answered	URL
17448	ACCUMULO-1219	bq. In the interests of getting something together quickly that people can use without too many acrobatics, would people be fine with adding a CreateEmpty utility to go along with PrintInfo and SplitLarge? TBH, I wasn't even anticipating making something new for this. I assume an "almost empty" rfile would be sufficient -- the likelihood of the delete actually causing problems would be rather small assuming that people know "roughly" the format of the data that was in their table. I wouldn't be opposed to accepting such a utility if someone writes it up though.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1219
17449	ACCUMULO-1219	[~etcoleman], it looks like we're stalled on an RC for at least a little bit due to the inability to log into the ASF nexus. How can I help make sure this gets into 1.6.0?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1219
17450	ACCUMULO-1216	bq. However, it would be nice to go back and use SequenceFile. Why? What are the benefits?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1216
17451	ACCUMULO-1216	bq. the files are split-able Say I have a 1GB WAL sequence file, could I treat them as two 500MB files and replay them in parallel? I think the answer is no as the order of mutations applied is important, correct?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1216
17452	ACCUMULO-1216	bq. Say I have a 1GB WAL sequence file, could I treat them as two 500MB files and replay them in parallel? I think the answer is no as the order of mutations applied is important, correct? Right the order is correct. Having a splittable file would allow you sort those two 500MB chunks in parallel. Then you could do a merged read of the two sorted chunks.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1216
17453	ACCUMULO-1216	bq. It supports metadata, which we now have to do ourselves. There's some underlying machinery that can help with backward compatibility. Can you give some more details on these points?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1216
17454	ACCUMULO-1212	A simple fix would be to configure redirectTestOutputToFile=true [1] on the surefire-plugin. Personally, I prefer to be able to actually read the test times as they scroll by. The other simple fix would be to just add/fix the log4j configuration in src/test/resources. Either are possible; Do people have an opinion on the subject? I know this was brought up not to long ago, but I don't think we ever actually came to any consensus. [1] http://maven.apache.org/surefire/maven-surefire-plugin/test-mojo.html#redirectTestOutputToFile	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1212
17455	ACCUMULO-1212	bq. I somewhat want to see the normal test output in the build... I just don't want to see logging messages unless I need to (debugging). What do you define as normal? Anything going to System.out? Would you want to see logging above a certain level? I can nuke some of the really chatty stuff right now. There's not much point to even redirect that to files.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1212
17456	ACCUMULO-1203	Changing the interface will break formatters that users implemented for an earlier versions. If the interface had been an abstract class, we would have had more flexibility to deprecate and add. With the interface, it does not seem there is much that can be done. Does anyone object to making this change? I think if we are going to break it then we should make it an abstract class so we will have more flexibility in the future. Or maybe an interface and abstract class combo, encouraging users to extend the abstract class in the javadoc.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1203
17457	ACCUMULO-1203	[~kevin.faro] how do you feel about adding a formatter which formats the Long as the readable date string? At an initial glance, it seems to me that adding the option to `scan` overlaps a little with what the Formatters were intended to do. But, the next line of thought would be the ability to stack Formatters. Although, an easy workaround would to make an extension point from DefaultFormatter which does the long->String change and then users could extend it when they have custom Formatters. Thoughts?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1203
17458	ACCUMULO-1203	bq. how do you feel about adding a formatter which formats the Long as the readable date string? I like that option.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1203
17459	ACCUMULO-1203	I gave it a go. Was this in line with what you guys were thinking?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1203
17460	ACCUMULO-1203	bq. I gave it a go. Was this in line with what you guys were thinking? When Josh mentioned an extension point, I thought of DefaultFormatter having a method like the following. With that method DateStringFormatter could extend DefaultFormatter and only override that method. {code:java} protected String formatTimestamp(long ts){ return ""+ts; } {code}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1203
17461	ACCUMULO-1200	Hey Corey, I don't see it generating the python/ruby thrift code. Can you look into it? Everything else looks good.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1200
17462	ACCUMULO-1182	Will 1.5 be released without an up-to-date developer manual? On Tue, May 21, 2013 at 3:53 PM, Christopher Tubbs (JIRA)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1182
17463	ACCUMULO-1179	Is this supposed to use HDFSZooInstance to get the list of zookeepers?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1179
17464	ACCUMULO-1177	I was thinking about the design for all of the 1.6 walog changes. Currently each batch of mutations thats written to a walog has a sequence number attached to it. This sequence number relates the mutations to an instance of an in memory map. Currently this sequence number is recorded in start and stop minor compaction events in the walog. I'm thinking we can possibly dispense with these start and stop minc event in the walog and instead store the seq# in the metadata table. This could be done with the mutation that writes out a new minor compaction file to the metadata table to make it atomic. It could be stored in a new column. It would need to increase monotonically for the lifetime of a tablet. I think this will have two benefits. * For ACCUMULO-1083, I think this will greatly simplify minor compactions and recovery. I think it avoids having to group logs and consider each group in order at recovery time. We would not need to write start and stop minc events to all active walog groups (even if no mutations were written to the current walog of the group). * For this issue, I think it leads to the possibility of sorting less data at recovery time. We can analyze the metadata table and determine for each walog what (tablet, seq #) pairs are needed. Then we would only need to sort mutations where the (tablet, seq #) is > whats needed. The drawback of this approach is that the walog will be less self contained.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1177
17465	ACCUMULO-1177	bq. With this approach, the reader could perform in-memory sorts for all the tablets What is "the reader"? I can guess, but I am not exactly sure what you mean. bq. we can remove the define tablet entries in the logs. Now that we're using tableIds, they are short enough to use directly. A tablet id is composed of (tableID,endRow, prevRow). Define tablet in the walog shortens this entire thing. So it seems like it would still be useful if the rows are long?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1177
17466	ACCUMULO-1177	bq. What is "the reader"? The service that presently sorts the logs. That service would be replaced by a service that can read the WAL, and keep only the mutations that come after the id in the !METADATA table. It could sort the mutations in memory, flushing them out to files as needed. At the end of the file, it can add the files to the tablet and remove the WAL reference. Tablet servers should refuse to load a tablet that has WALs. bq. So it seems like it would still be useful if the rows are long? You're right.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1177
17467	ACCUMULO-1177	Marking this with fixVersion 1.7.0, since there's where the work logged against this issue have gone. Is this issue ready to close? I'm not sure, because there's still an outstanding sub-task. Do we want to move that sub-task off to its own top-level issue?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1177
17468	ACCUMULO-1175	Is this something different than ACCUMULO-420?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1175
17469	ACCUMULO-1175	Well crud, I didn't realize that. Does it apply for flush as well?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1175

#	Requirement	Questions	Answered	Successfully Answered	URL
17470	ACCUMULO-1175	bq. Does it apply for flush as well? Maybe. You have the option to flush before compacting. But there is no way to only apply it to flush. Is that what you want? {code:java} public void compact(String tableName, Text start, Text end, List<IteratorSetting> iterators, boolean flush, boolean wait) {code}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1175
17471	ACCUMULO-1167	Is there any additional work to be done on this outside of what was done for ACCUMULO-1313?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1167
17472	ACCUMULO-1166	Do the same release rules for TLPs apply to contrib projects (aka, this endeavor)? If so, I need to get my butt in gear with a released candidate and all that fun stuff so we can release this alongside 1.5.0. I didn't see anything obvious on http://www.apache.org/dev/release.html	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1166
17473	ACCUMULO-1166	I downloaded the trunk version. Then generated instamo-example. When I tried to run 'mvn install' I ran into a couple of problems. I needed to make log4j a top level dependency and select v1.2.16. Log4j v1.2.15 seems to have some issue in the maven repositories (see http://stackoverflow.com/questions/9047949/missing-artifact-com-sun-jdmkjmxtoolsjar1-2-1). There is also a v1.2.17 available. Once that dependency issue was resolved, I needed to add a dependency for accumulo-start because org/apache/accumulo/start/Main was not found. I'd love to get this working properly. What can I do to help?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1166
17474	ACCUMULO-1166	Ok, both should be working again now. I needed to account for the provide changes. Also, I have no idea why start, fate and trace weren't already included (and how they previously worked without them?). Also ran into some weirdness with ZK wanting to include jms, jmxri, and jmxtools (which you'd have to download yourself), so I just excluded them. Let me know if that works for you?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1166
17475	ACCUMULO-1165	What does this get us over properly integrating Kerberos support into our services? Kerberos is already the standard way that multi-service systems handle mutual authentication (both in general and specifically within Hadoop). It's already had far better analysis done than anything we come up with and operators that need secure set ups are more likely to be familiar with it (or to already have established a support path for dealing with it).	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1165
17476	ACCUMULO-1160	What's left in the mapreduce API for this?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1160
17477	ACCUMULO-1159	I'm getting this on the shell {code} 2013-03-12 17:53:15,239 [trace.ZooTraceClient] DEBUG: Scanning trace hosts in zookeeper: /accumulo/750ccec4-8c71-47e5-abb8-c374a4ca8139/tracers 2013-03-12 17:53:15,239 [trace.ZooTraceClient] DEBUG: Trace hosts: [] 2013-03-12 17:53:15,276 [impl.ThriftTransportPool] TRACE: Creating new connection to connection to 172.16.101.54:9997:9997 2013-03-12 17:53:15,296 [impl.ThriftTransportPool] TRACE: Returned connection 172.16.101.54:9997:9997 (120000) ioCount : 90 2013-03-12 17:53:15,308 [shell.Shell] ERROR: java.lang.ClassCastException: org.apache.accumulo.core.security.handler.Authenticator$AuthProperty cannot be cast to java.lang.Comparable 2013-03-12 17:53:15,309 [shell.Shell] DEBUG: java.lang.ClassCastException: org.apache.accumulo.core.security.handler.Authenticator$AuthProperty cannot be cast to java.lang.Comparable java.lang.ClassCastException: org.apache.accumulo.core.security.handler.Authenticator$AuthProperty cannot be cast to java.lang.Comparable at java.util.TreeMap.compare(TreeMap.java:1188) at java.util.TreeMap.put(TreeMap.java:531) at java.util.TreeSet.add(TreeSet.java:255) at org.apache.accumulo.core.security.handler.ZKAuthenticator.getProperties(ZKAuthenticator.java:49) at org.apache.accumulo.core.util.shell.Shell.config(Shell.java:288) at org.apache.accumulo.core.util.shell.Shell.main(Shell.java:417) at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method) at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:57) at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:43) at java.lang.reflect.Method.invoke(Method.java:601) at org.apache.accumulo.start.Main$1.run(Main.java:99) at java.lang.Thread.run(Thread.java:722) {code}	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1159
17478	ACCUMULO-1145	Would it help for now to use the AccumuloMiniCluster? I've had much success debugging iterators this way.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1145
17479	ACCUMULO-1136	Applied patch in r1452005 and added a note about the VFS classloader bq. In the documentation that mentions lib/ext, its probably worth mentioning the ability to load iterators from a URL. [~kturner] I assume you meant the VFS classloader? I know it's off by default, but was any documentation written for it? Just the basics: what it uses, how does it work with Accumulo, and how to configure it.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1136
17480	ACCUMULO-1134	Can't you already do that in {{monitor_logger.xml}}? Example available at http://svn.apache.org/viewvc/accumulo/trunk/conf/examples/1GB/native-standalone/monitor_logger.xml?revision=1382614&view=markup line 28 and 39.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1134
17481	ACCUMULO-1134	Is there a palace where user can specify configurations like these?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1134
17482	ACCUMULO-1132	What's your status on this ticket? I'll take it up if you don't have the cycles for it.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1132
17483	ACCUMULO-1131	What do you have in mind for examples?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1131
17484	ACCUMULO-1130	is there a reason you changed the Credential object from singular to plural in this patch?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1130
17485	ACCUMULO-1124	I was running Fluo's Webindex example on EC2 for a long period. After running the example I inspected some RFiles. Some of them had larger indexes than I expected. I suspect making a change mentioned in the ticket would reduce the index size. Below is info for an rfile that uses URLs from web pages in keys. I am going to experiment with generating shorter keys in the index for this file. This file was generated using 64K data blocks and 256K index blocks. {noformat} [centos@leader1 ~]$ accumulo rfile-info --histogram /accumulo/tables/7/t-0003uq7/A000rxoi.rf 2016-05-16 16:48:38,914 [rfile.PrintInfo] WARN : Attempting to find file across filesystems. #	Requirement	Questions	Answered	Successfully Answered	URL
17486	ACCUMULO-1124	bq. I experimented with shortening keys in the index and that gave some nice improvements, but not as much as I expected. I realized that even with those changes, bad keys were still being placed in the index. I added code to keep statistics on key sizes and used those statistics to try to select keys that were <=AVG(keySize). I also excluded keys that were too big (greater than 3 std dev from the mean). I had the thought "how would we determine when index size is efficient" in the future (both evaluating the success of this change as well as identifying perf issues in the future). Did you give any thought about how we could expose this information more easily? Maybe we include some extra information in the file entry in metadata so that the master/monitor could easily aggregate/report on file statistics? Not suggesting it needs to happen now, but wondering your thoughts (since I assume you were doing all this investigation by hand).	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1124
17487	ACCUMULO-1122	Can someone comment on this JIRA with some info on the current CMS situation? Or, in particular, what SVN path is the desired target for the 'mvn site' output in the CMS?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1122
17488	ACCUMULO-1122	Is this something that we still want? [~ctubbsii], I know you were working on related issues.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1122
17489	ACCUMULO-1102	Should the deleterange command exist in core/src/main/java/org/apache/accumulo/core/util/shell/commands? I am not seeing it. And my shell command does not seem to know about it.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1102
17490	ACCUMULO-1098	Billie, do you have an HTML to PDF tool in mind?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1098
17491	ACCUMULO-1096	What is the convention?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1096
17492	ACCUMULO-1085	We ran an unintentional test the other day where we ran tdown on an actively ingesting cluster with lots of memory, and recovery of the tablets was too slow to wait for (would have taken many hours). I think that's a really good reason to try to get this into 1.5. Has anyone else experienced similar problems? bq. When walogs are recovered, they are immediately compacted. This is done to keep from running out of memory, in the case where multiple large in memory maps need to be recovered. Having multiple threads doing log recovery could possibly exhaust memory. The code that does recovery would need to defend against this in some way. Can we flush tablets that already have a lot buffered (i.e. those that are not being recovered)? Writing really small RFiles might be a source of inefficiency that is leading to slow recovery times, although I have no evidence to back that up.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1085
17493	ACCUMULO-1085	Stumbled across this one. Perhaps we could start running assignments in serial and, when we get far enough to know that there is no recovery to perform, we could kick off another assignment. Would help speed up the normal case, while being able to push the memory issues down the road.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1085
17494	ACCUMULO-1083	In the general scope of walog performance, I have a few questions that may or may not have been explored in development and testing. # Hadoop sync/appends have gone through several iterations since they were introduced into the core release. Does anyone have any info on the performance of appends in the various hadoop releases? I'm thinking [~billie.rinaldi] or [~tlipcon] may have some insight. # [~ecn]Can you provide some general insight on how the new waloggers are implemented? I have vague recollection of the incoming Mutations pooling with another thread constantly re-syncing. Does this achieve the same result as the group commits we had added recently? # General community question- do we have any standard benchmarks or performance charts for append, or even general HDFS performance, in regard to system configuration? Specifically filesystem use, system configuration for disks, mounting options, and the like? Thanks	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1083
17495	ACCUMULO-1083	Well, doesn't a factor of 1 still give some more durability since it'll be there if a tablet server dies from running out of memory or something like that?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1083
17496	ACCUMULO-1083	I will run the tests with replication factors of 2 and 1 to fill in the gaps on the table and report back. I wish that I could edit posts. Do I need special permission to do that or do you just have to be a committer?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1083
17497	ACCUMULO-1083	For 1.5, that table seems to indicate that adding n replicas of a log file results in a 1/(n + 1) effect on aggregate throughput. How would we make the logging process more concurrent-- would we add more log files per tablet? Per tablet server? Would adding more files actually do anything, since it seems like we're paying a penalty on a per replica basis, indicating that more raw files may decrease throughput?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1083
17498	ACCUMULO-1083	bq. [~ecn] Concurrent, as in, a sub-set of tablets use a log, or concurrent, as in, there are multiple log files available to log to, as described in the Big Table paper? I think this got lost in the chatter. bq. [~vines] Hadoop sync/appends have gone through several iterations since they were introduced into the core release. Does anyone have any info on the performance of appends in the various hadoop releases? I would be curious about the results from running the same test against 0.23 or 2.0 bq. [~billie.rinaldi] If people think it's important for everyone to be able to edit their own comments, we can ask. I'd have to agree it'd be nice for everyone to be able to edit their own message. Unless there's something to say otherwise. bq. [~brassard] It's also worth noting that the default Accumulo behavior is to use the default of Hadoop, so it's not necessarily set to 3 automatically. Given we used to run with 2 by default (and we didn't have widespread data-loss issues), we could have Accumulo do the setrep 2 by default for the WAL dir. But, I think this merits discussion which is parallel to the one we're already having. bq. [~bills] For 1.5, that table seems to indicate that adding n replicas of a log file results in a 1/(n + 1) effect on aggregate throughput. Sounds about right. But I'm not sure the picture isn't a bit larger than what we're looking at here. [~brassard], can you post relevant HDFS configurations (hdfs block size, datanode handler count, datanode xcievers, etc)? Given the beefiness of your nodes, performance seems low to me. Doing some hand-wavy math.. 15*8=120drives, ~100MB/s write per drive, gives you ~12GB/s write across your cluster. Even knocking that back to say 1.2GB/s write "actual".. that's still far above 5.7MB/s * 8nodes * 3replicas = 136MB/s. With 32 cores, I wouldn't think you're CPU bound. Yet it doesn't seem like you should be IO bound. I assume you're also memory heavy? Do you have stats from Ganglia or iostat that show IO performance? What about network performance? What filesystem are you using for the partitions hosting the data dirs? Without research, I also don't know how the TServer "finishing" writing a mutation aligns with the replicas writing. Does each datanode writing a replica need to complete the write before the TServer will return to the client? Does only one datanode need to finish? Lots of questions :D	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1083
17499	ACCUMULO-1083	bq. Does each datanode writing a replica need to complete the write before the TServer will return to the client? Yes, in the normal case. However multiple sync's and replications can run in parallel on the same file.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1083
17500	ACCUMULO-1083	A regular block write will return as soon as dfs.replication.min nodes have completed the operation (default 1). Are we certain that append behavior isn't the same?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1083
17501	ACCUMULO-1070	Great. I removed 1.5 from the fix version as we are passed the feature freeze date for 1.5.0. Are you also interested in auditing writes and bulk imports?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1070

#	Requirement	Questions	Answered	Successfully Answered	URL
17502	ACCUMULO-1070	I am still looking at the patch, but I have few comments. I will look at it some more tomorrow. * Did you intend to include changes to AccumuloApp as part of the patch? * the patch enables auditing by default, was this intended? * Will be logging binary data,this will be lossy. For example it will log the columns a user fetches. Could consider encoding base64 non-ascii characters, but I am not sure about this. * may be useful to audit credentials.getTokenClassName() in addition to credentials.getPrincipal() Phillip, I will add you as a contributor on jira and the Accumulo web site. Send me an email if you would like your org and timezone set on the web site.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1070
17503	ACCUMULO-1070	Thanks for looking over the patch Keith. We are back at work now, so should be able to make any changes necessary. I will update the patch to: - have the auditing disabled by default (i don't think that it should be on unless you want it) - The changes to AccumuloApp do not need to be updated, but it won't hurt if it does. - I will look into the logging of binary data. - We will add a section to the documentation explaining the audit feature and how to enable/disable. Can you explain what credentials.getTokenClassName() gives us that would be useful for auditing? Cheers Phil	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1070
17504	ACCUMULO-1070	bq. Can you explain what credentials.getTokenClassName() gives us that would be useful for auditing? [~ctubbsii] or [~vines] may be able to give you a more precises explanation. This is all in flux. Basically, it possible for a user to authenticate against a user database in zookeeper or a pluggable authentication system like ldap. I think the token class name may give a clue as to which the user is attempting to use.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1070
17505	ACCUMULO-1070	bq. Hey Keith can you please add me as a contributor on Jira too, thanks Sure. You worked on the patch w/ Philip, but I was not sure if you wanted an entry on the web page.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1070
17506	ACCUMULO-1070	Rob, is there a reason why you pulled all the printf constants to one place? That's not typical for the rest of the codebase, and it's nice to see the template next to point where it is expanded. Otherwise, it looks good.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1070
17507	ACCUMULO-1070	[~ptyoung] and [~robtallis] are you satisfied with the patches, as applied? Can we close the ticket? If not, please let me know what remains outstanding.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1070
17508	ACCUMULO-1052	Commits shouldn't be held just because a tablet is minor compacting, right? The tablet server has to run out of space in the write buffer across all tablets, or the tablets would have to be in a state of migration or going offline. Do you know what's causing the commit hold? Are minor compactions on tablets on this tablet server less efficient (this should be evident in the performance debug logs for that tablet server)? Could this be that the merging minor compactions are kicking in and reducing the compaction efficiency? If the number of files is growing unbounded then that seems to indicated the merging minor compactions are not kicking in. Is that a separate issue, or perhaps something related? How many files are referenced by the tablet in question?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1052
17509	ACCUMULO-1045	Is this handled by the -e option?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1045
17510	ACCUMULO-1045	bq. No. The shell has serious limitations. The intent is to obsolete it with more convenient utilities. Can you elaborate on this somewhat? I am aware of many of the limitations of the shell, but was under the impression that the thrift proxy was supposed to make writing python et. al. scripts a lot easier.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1045
17511	ACCUMULO-1041	At some point, regarding the changes to the security token stuff, the code in ConfiguratorBase.getToken() had the code reverted that I added for ACCUMULO-829, to read from the DistributedCache. Do you know if anything else got reverted aggressively that maybe should not have been?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1041
17512	ACCUMULO-1041	1. Looks good 2. This is primarily a convenience method for a lot of the testing frameworks. It's possible to work around, but would make a lot of the code more ugly. 3/4. Really like this idea, replace it with get property info or something which spits back sets of properties which can be used and descriptions. 5. Sounds good 6. I'm okay with spinning out the User Management stuff, as per other discussions. However, this is a bit of authorization work, but mostly Permission management. And I have an illogical liking of the name SecurityOperations, but I can't identify why. 7. Do you mean use a special token type so user's can't spoof the !SYSTEM principal? I'm okay with this too. 8. yup 9. yup 10. I thought I had migrated them over. Though I may have done it in one of the other iterations and gotten fed up and did things poorly until we were well cemented. 11. what items do you have in mind?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1041
17513	ACCUMULO-1041	First of all, was 1 supposed to be Instance.getConnector(String p, Props t)? Or was it actually supposed to be Connector...? Well the reason for the properties was for better handling in the cli and proxy. In the instance, it should basically be (Authenticator(Class.forName(getAutheticatorClass()).instanceOf()).login(properties). And perhaps we should expand the client side Authenticator interface to also have a get property sets which returns the valid pairings it requires. What sort of issues are you forseeing?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1041
17514	ACCUMULO-1041	bq. Any reconsiderations? If not, I would like to get started on this. Isn't Christopher working on this in the branch he created?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1041
17515	ACCUMULO-1031	Is there a utility to flag the malformed javadoc comments?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1031
17516	ACCUMULO-1030	I was actually just thinking about this today. Do you have any ideas about how to isolate configuration changes, existing tables, etc from different integration tests? It would be nice to spin up the single MAC instance in pre-integration-test, and not have to worry about what other integration tests are doing as I write a new test (I'm thinking of some sort of weird tests against !METADATA). Perhaps this is something that could be addressed down the road if it becomes an impediment. Regardless, I definitely like the general idea here.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1030
17517	ACCUMULO-1028	What issues of token serialization/deserialization would be introduced by this ticket?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1028
17518	ACCUMULO-1028	Agreed. I just don't know how that relates to this ticket, which is about the API, not serialization. I made another ticket that relates more to serialization (ACCUMULO-1027), to support a wider variety of tokens by only requiring them to know how to convert to a binary to be carried in a thrift object, and Eric made a ticket (ACCUMULO-1003) to question the API that determines the method by which tokens are actually serialized. Is there a way I can re-word this ticket, to make it more clear that it's about the API?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1028

#	Requirement	Questions	Answered	Successfully Answered	URL
17519	ACCUMULO-1028	I see. Certainly, (String, byte[]) would be least intrusive to the public API, and (Principal, byte[]) minimally more so. However, why should it take the already serialized token? That could complicate user code, because then they have to serialize the token (or rely on the system that provides the token to do it)... for *our* RPC calls. That doesn't make sense to me. We don't necessary need a serialized token... we just need to know how to serialize it, and the implementing class can define that so we don't have to. You said above that there's no need for them to follow a strict serialization/deserialization interface, but you're imposing one anyway (it's unavoidable), essentially "convertToBytes() and convertFromBytes()". Don't get me wrong... I've no problem with byte[] as the result of that imposition (in fact, I think it's necessary for ACCUMULO-1027)... I just don't like seeing arbitrary byte arrays in the public API... I'd rather do it behind the scenes... because a byte array could be anything, and you lose all compile time checks, and I don't think this is user-friendly for an API. We're developing in a high level language, and we can do better than expressing objects as non-expressive byte arrays in our API. You're right about the generics. It doesn't need to be a generic method. The reason why a generic method is because (I think) it's easier to express to the user what the method is expecting, but it could just as easily have been: {code:java} public Connector getConnector(Principal userPrincipal, AuthToken authToken); {code} They both achieve the same thing. (Unless we wanted to return a Connector<T> to support things like Connectors that automatically renew tokens that expire, or provide other token manipulation methods, like those in SecurityOperations, in which case, it would be better to have the generics. I'm not suggesting we do that, but the current implementation of ACCUMULO-259, without addressing ACCUMULO-1024 would benefit from it if the generic parameter is passed down to the Connector's SecurityOperations, so users can get compile-time checks against using inconsistent token types in the API). (Note also that I'm using "AuthToken" rather than "SecurityToken", because I think it better expresses its role, because "security" could mean anything.)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1028
17520	ACCUMULO-1026	It's important for users of our API to be able to automatically identify areas where their code might not work on future versions of Accumulo. @Deprecated ties into the standard convention for doing that analysis. If we replace @Deprecated with some other annotation then our users will lose the automatic warnings. Is there another way around this problem?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1026
17521	ACCUMULO-1024	Can we use Tomcat for inspiration? Too naive?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1024
17522	ACCUMULO-1024	I like it, [~ctubbsii]. Do you basically see it as a hardcoded ZKAuthenticator/Authorizor/PermHandler and then the Authent/Author/PermHandler have an option for nil? Or something else?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1024
17523	ACCUMULO-1024	What is your status on this ticket? I'm weary to do any 259 documentation until the dust clears. I would work on this, but you've had it marked in progress for a while. If you can give an update, I have some cycles to wrap on this.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1024
17524	ACCUMULO-1021	Do we want to make it 'secure' out of the box, or do we want it easy to use out of the box? And by easy to use, I mean avoiding any questions regarding security that the user may or may not understand/comprehend the repurcussions of. And I quote secure, because we can only go so far with an out of the box implementation so users may have an overextended sense of security because of this ticket.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1021
17525	ACCUMULO-1021	How does the "transparent encryption" feature in HDFS relate to this? IMO, I'd be much happier to rely on HDFS to encryption for us but I know HBase has also run into issues already with different semantics on some HDFS class implementations HBASE-13221.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1021
17526	ACCUMULO-1015	How much of this would we get with a combination of HDFS caching and HDFS short circuit reads?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1015
17527	ACCUMULO-1015	bq. How much of this would we get with a combination of HDFS caching and HDFS short circuit reads? Well, you'll still be incurring the overhead of the IPC to the datanode and reading the data from there, so I imagine it is still "significant" as opposed to completely in memory. I think it would likely depend on the level of implementation of an in-memory table. If we just keep the HDFS blocks in the tserver memory, that would be fairly "simple" and should still perform better, but I don't have any idea of actual numbers. That would be a good first step that someone could evaluate without implementing anything new in-memory 1. Load some data in a table 2. Warm the caches for that table 3. Test performance short-circuit reads 1. Turn off caches 2. Ingest data into a table 3. Compact to disk 4. Test performance	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1015
17528	ACCUMULO-1014	[~ecn], are you thinking about more complex operations like group, order and/or join too? I've seen some simple mockups that implement selection and projection using a basic REPL. Views could also be fairly easy to implement.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1014
17529	ACCUMULO-1014	How about we work to support [Phoenix|http://phoenix.incubator.apache.org/] instead of doing our own thing?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1014
17530	ACCUMULO-1014	So, Pig-0.13 and Hive-0.14 both have support for Accumulo. Trying to make Phoenix work would be another avenue for another query implementation. Do you want to keep this open, [~ecn]?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1014
17531	ACCUMULO-1013	Is there any way to quantify the number of hours this kind of change might take? If the change were broken into phases, what might those phases look like?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1013
17532	ACCUMULO-1013	Thanks. I did see the ticket for the Metrics2 integration, but have not looked yet at the implementation. Do you know if it is just exposing the metrics collected by the JMX MBeans, or a different set of metrics?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1013
17533	ACCUMULO-1013	bq. Do you know if it is just exposing the metrics collected by the JMX MBeans, or a different set of metrics? Yeah, same metrics we have exposed now. No new metrics were added, just the ability to use metrics2.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1013
17534	ACCUMULO-1012	AggregatingIterator is still in the code base, and has been deprecated since 1.4 - should it have been removed for 1.5? What other deprecated pieces should have been dropped in 1.5, but weren't?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1012
17535	ACCUMULO-1011	Each tablet could have a marker indicating if its a candidate for automatic merge. User created tablets would be marked ineligible. When a user created tablet automatically splits, the low child would be marked eligible (this is the system created tablet) the high child would left marked ineligible. User created tablets would only go away when the user initiates a merge. With this strategy automatic splits can be automatically merged. Is this what we want? Cloning would need to copy these markers.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1011
17536	ACCUMULO-1009	Another outstanding issue is that the mechanism by which mapreduce jobs are distributed to tasktrackers is a man-in-the-middle-able vector. I'm not sure how to address that besides making the location the client looks for truststores completely unconfigurable from the job config. At the moment, you can't inject novel trust along the wire, but if you have write access anywhere on the tasktracker node, you could point the tasks to a local truststore of your choosing. What do people think? Would keeping the trusted roots on HDFS be any better? Should you be able to configure where truststores are allowed to be loaded from? (although not through job config, of course) Better ideas?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1009

#	Requirement	Questions	Answered	Successfully Answered	URL
17537	ACCUMULO-1009	Took a quick look at the patch. The patch adds a lot of constructors to ZooKeeperInstance. I'm thinking of just adding the following constructor : {code:java} /** * @param config provides all information needed to connect to an Accumulo instance. @see ClientConfiguration */ public ZooKeeperInstance(AccumuloConfiguration config){} {code} This would allow us maximum flexibility in the future w/o clutering the API as new features are added. The zookeepers, instance name, wether or not use ssl, etc. would be obtained from the config. This constructor would be the way to enable ssl. There is some code that pushes the client address and port across threads so its shows up in list scans, do you know if this is still working with the changes you made?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1009
17538	ACCUMULO-1009	I also felt a little weird about the constructor bloat. Just having a single config constructor makes sense, but currently it'll be pretty awkward to use. Maybe I should also add a ClientConfigBuilder with some fluent methods for setting common config switches? I'll take a look at the client address listing code. Can you point me to a relevant entrypoint?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1009
17539	ACCUMULO-1009	bq. Maybe I should also add a ClientConfigBuilder with some fluent methods for setting common config switches? To me that seems like a good way to go. It makes programmatically setting lots of optional configurations easier. The client side config objects constructor could possibly take the required options (or a file that must contain the required options). All the optional stull could be fluent methods are you suggested. bq. I'll take a look at the client address listing code. Can you point me to a relevant entrypoint? Its possible that org.apache.accumulo.server.util.TServerUtils.ClientInfoProcessorFactory may be setting this up. It sets the thread local clientAddress with the client info. The thread pool server has not been used in a while, so I am just curious if this still works.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1009
17540	ACCUMULO-1009	WRT JSSE config, I wouldn't feel great about making the JSSE system properties be the only way to configure the accumulo client's SSL settings. It's JVM global, and accumulo clients may well make connections to multiple services or provide their own SSL server. Especially since I'm imagining the most common deployment will involve private roots, it seems overly restrictive to require the accumulo SSL config to be identical to the SSL config used across the entire client app. However, I do think it makes sense to optionally tell accumulo to use the JSSE config. I'll add that option. I'm working on separating AccumuloConfiguration from ClientConfiguration now, but they will have to cross paths at some point in the codebase, since accumulo services need to be able to make thrift connections to other accumulo services, and they will ultimately get their config from AccumuloConfiguration. Do you think it would make sense to have AccumuloConfiguration.getClientConfig()? Then, if we're in a context that does have an AccumuloConfiguration, we can access common code for creating connections, while contexts like ZooKeeperInstance need not know anything about it.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1009
17541	ACCUMULO-1009	I'm not rewriting any custom socket code...all the socket code is deep inside thrift. There's no way the JSSE properties can be respected automatically, since the thrift stack looks pretty different for an SSL server, so we will end up examining and branching based on the properties no matter how we do it. So are you ok with properties like {{javax.net.ssl.keyStore}} being defined in accumulo-site.xml and the Property enum? This is not a client-side setting; the tservers themselves need to know where to find the keyStore. I've also noticed there is already {{monitor.ssl.keyStore}} (and associated properties) used for configuring SSL for the monitor's webpage. This has different requirements from the thrift SSL settings, since there is only one monitor, but it would be good for it to be signed by a root that browsers are likely to recognize. This means that probably you want the monitor to have a cert cut from a "real" CA, but enforcing that requirement for every tserver will be unwieldy and not necessary for most deployments. Is there any particular reason that it's ok for the monitor to have custom SSL properties, but not the RPC connections? Or, if the monitor _should_ use JSSE properties, how should we resolve the different requirements between it and the RPC connections? Or do you think we should only be using JSSE properties for clients, and use our own settings for servers? In which case, which side do the thrift clients created by accumulo services fall on?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1009
17542	ACCUMULO-1009	I've attempted to apply the patch to give it a try. The unit tests are failing with: {{{ Tests in error: testPerTableClasspath(org.apache.accumulo.minicluster.MiniAccumuloClusterTest): Unable to load client config from /tmp/junit8216417786686969359/conf/client.conf test(org.apache.accumulo.minicluster.MiniAccumuloClusterTest): Unable to load client config from /tmp/junit8216417786686969359/conf/client.conf }}} Can you update the patch against master and ensure that the unit tests run? I'm sure I just missed something trying to get the existing patch to work.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1009
17543	ACCUMULO-1009	[~mberman] wrote: {quote}I'm not rewriting any custom socket code{quote} That's good at least, but... {quote}There's no way the JSSE properties can be respected automatically{quote} is simply not true. See TSSLTransportFactory.getServerSocket(int port) or the two param one (int, int)'s javadoc. Whether you use this method or the one that explicitly passes these properties, I don't care... so long as it falls back on the JSSE properties, the configuration looks similar to JSSE property names, and it supports all the features that the JSSE properties would if they were set as system properties. {quote}This is not a client-side setting{quote} The issue is applicable to both client-side configuration and server-side configuration. My previously expressed opinions were primarily for client-side configuration. For server-side, I've been thinking about better scoped configuration anyway (separate config files... not xml, and separate enums, for separate services). That would resolve some of these questions about where to put configuration and would address the monitor's limited ssl configuration as well. In the meantime, I think something like instance.javax.net.ssl.* or general.javax.net.ssl.* might be a decent compromise for server configuration. {quote}the tservers themselves need to know where to find the keyStore.{quote} Recall that part of my criticism of a keyStore-only based configuration was based on the idea that there are other JSSE properties allow you to configure an alternate provider as well (eg. javax.net.ssl.keyStoreProvider). {quote}This means that probably you want the monitor to have a cert cut from a "real" CA, but enforcing that requirement for every tserver will be unwieldy and not necessary for most deployments.{quote} How is this unwieldy? I concede that monitor may have different certs than tservers, but I don't agree that having a "real" CA for every tserver will be unwieldy or unnecessary. Having a CA that is trusted sign the certs used by the tservers is essential for clients communicating with the SSL-enabled instance... otherwise, they'll have to have a trustStore that includes the cert of every tserver... and *that* is unwieldy. Unless you were planning on making clients trust anything that the tserver throws at them... which would undermine the security of the feature. {quote}Is there any particular reason that it's ok for the monitor to have custom SSL properties, but not the RPC connections?{quote} No. See my suggestion above for the scoping of properties in separate properties files, and the compromise for prefixing them with a particular scope. The main point is I want users to understand at a glance that something like "monitor.javax.net.ssl.keyStore" is "javax.net.ssl.keyStore" scoped to "monitor". This gets murkier, if the property names are "monitor.ssl.keyStore", but we're stuck with that for now. The main point I want to make for the RPC is that I want to ensure we're moving forward towards a more intuitive and flexible configuration standards. It is not necessarily a blocker for the feature.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1009

17544	ACCUMULO-1009	{quote} >> There's no way the JSSE properties can be respected automatically is simply not true. See TSSLTransportFactory.getServerSocket(int port) or the two param one (int, int)'s javadoc. {quote} My point was, we at least need to figure out if we want to use a TSSLTransportFactory at all. And beyond that, the stack is still quite different since the THsHaServer doesn't support SSL. So I'm still confident "we will end up examining and branching based on the properties no matter how we do it" is true. {quote} I think something like instance.javax.net.ssl.* or general.javax.net.ssl.* might be a decent compromise for server configuration. {quote} This sounds fine to me. {quote} >> the tservers themselves need to know where to find the keyStore. Recall that part of my criticism of a keyStore-only based configuration was based on the idea that there are other JSSE properties allow you to configure an alternate provider as well (eg. javax.net.ssl.keyStoreProvider). {quote} Here I was just using keystore as an example property. Replace "keyStore" with "keyProvider" and my point still stands. But it sounds like this issue is addressed by your other answers anyway, so no big deal. {quote} >> This means that probably you want the monitor to have a cert cut from a "real" CA, but enforcing that requirement for every tserver will be unwieldy and not necessary for most deployments. How is this unwieldy? I concede that monitor may have different certs than tservers, but I don't agree that having a "real" CA for every tserver will be unwieldy or unnecessary. Having a CA that is trusted sign the certs used by the tservers is essential for clients communicating with the SSL-enabled instance... otherwise, they'll have to have a trustStore that includes the cert of every tserver... and that is unwieldy. Unless you were planning on making clients trust anything that the tserver throws at them... which would undermine the security of the feature. {quote} I think you've misunderstood me here. Absolutely the tservers' certs need to be signed by a known CA that can be trusted by clients. I believe there's value in the monitor's https cert being signed by a public root CA that is likely to be known about by web browsers. This is what I meant by a "real" CA, and this is the part that seems unwieldy (and usually unnecessary) for tserver certs. It's easier to distribute custom trusted roots to client applications than to end users' web browsers, and getting certs signed by public trusted roots is expensive, usually requires manual intervention, and is impossible if you want to do hostname verification for machines not on the internet. This is the distinction I was trying to draw between requirements for monitor vs. thrift certs. But, since it sounds like you're fine with a service qualifier before the JSSE-like property key, I believe that addresses my original concern.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1009
17545	ACCUMULO-1009	[~ctubbsii] you have some very specific ideas about client side config that sound good. Do you think you would have time to put something together for 1.6 that [~mberman] could use for this feature? It seems to be a bit of dependency for this feature. I am just trying to work out how we can have minimal churn from a users perspective. Introducing this feature in 1.6 and a proper client side config in 1.7 is sub-optimal for users.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1009
17546	ACCUMULO-1009	I just spent a bit looking at a patch. And I see a new one was posted recently, these may be against the older one. It would be nice to post multiple version of the patch and then I could state that my comments are against version 002 of the patch. * what does certutils do that keytool does not? or does it just make things easier? How do you expect the user to run this? "accumulo org.apache.accumulo.server.security.ssl.CertUtils" ? If this is the case, then this utility is not front and center and the user would really have to look for it. * should generate all print a disclaimer clearly stating any potential pitfalls/risk the user should be aware of? [~ctubbsii] would this address your concern? * Adding ssl options to MAC is done to test Accumulo itself. However this will also be available to Accumulo users using MAC. Is this an API you feel comfortable supporting for a few years? * I am not in favor of adding "public ZooKeeperInstance(String instanceName, String zooKeepers, boolean sslEnabled)". This is not a scalable approach for configuring Accumulo. For example when ACCUMULO-1268 is implemented we would not want constructors for : (..., sslEnabled), (...,sslEnabled,timeout), (...,timeout) . I think the constructors that take ClientConfiguration are sufficient and ClientConfiguration looks nice, like it. I am kinda torn about making client and sever config follow differnt models, but the new client config seems better. I still need to look at it in more detail. * what needs to be done for the proxy w.r.t to ssl? should ClientConfiguration be exposed to proxy api? should proxy server support ssl? maybe we should create sub-tickets Seems like we need test for the following scenarios : * Server requires clients have cert signed by trusted CA (test client w/ valid cert, w/o cert, w/ invalid cert) * Server requires SSL, client tries connecting w/o SSL * Server does not have a cert that client trust * Multiple ZooKeeperInstances in the same java process with different SSL config (is this possible? It looks like you included ssl options in the Key in ThriftTransportPool?) This could happen if a single process connected to multiple Accumulo instances	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1009
17547	ACCUMULO-1009	[~vines]: We can make MAC easy to configure SSL for testing, regardless of whether the provisioning code is there or not. But what specific security configuration are you testing by providing a security switch that automatically provisions and configures MAC? The described situation is no different than configuring the jetty-maven-plugin with certs to test a webapp in Jetty with ssl... but you don't see Jetty with a "do security" configuration option that automatically chooses a security configuration to test against... you still have to provision certs (generating certs, using something like keytool-maven-plugin, if testing in maven, or by providing a specific cert), in order to test the app with that *specific* security configuration. Testing "security on" is next to meaningless. Testing a *specific* security configuration is far more valuable to users. So, I'm not convinced that users will get value from MAC having provisioning code. However, I *do* think there's value in documenting the provisioning and configuration of certs (with openssl or keytool) in an example. And... what would be *really* valuable is having this done automatically in an integration test baked-in to the next version of the Instamo maven archetype that supports SSL.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1009
17548	ACCUMULO-1009	Trying to catch up on the discussion (glad to see such in-depth discussion :D) As [~kturner] and [~_alexm] touched on, I think it may be good to take a step back and provision out the sub-tasks here. As a general statement, my gut agrees that we don't want to be in the "security provisioning" realm just for the monumental difficulties in doing it correctly. That being said, I think it would be prudent to have some sort of "basic" mechanism in which we can test things. The simplest approach to me would be to generate cert(s), keystore, local-CA, and w/e else we need to run "securely" for MAC, document how it was done, and then bundle that as a first go-around. A sub-task can be made to find a happy medium with what we could do automatically and what is best left up to the integrator/sys-admin? Testing security for the sake of "is it secure?" is likely without much gain, but there are definitely the edge-cases like [~kturner] pointed out which need testing. All that being said, trying to break down the larger wire encryption issue into some more tenable pieces is a good idea (plus so the next patch doesn't break the 4k line count :D)	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1009

#	Requirement	Questions	Answered	Successfully Answered	URL
17549	ACCUMULO-1009	bq. So, you run accumulo init-ssl Where is this in the patch? I search the patch for "init-ssl" and find nothing. bq. Then, if you run init-ssl on another node, it copies the root to the local system, cuts a fresh private key off of it, and sticks both in the default locations If you have time I would really appreciate if you could post example commands for initializing a 3 node cluster using this process. bq. if you have connected successfully with some cert, and then in the same process you try to connect with a different cert, you could get a cached, connected transport I think it would be worthwhile addressing or at the very least opening a subticket to track the issue so its not forgotten. I'll open a subticket.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1009
17550	ACCUMULO-1009	I'm assuming by "the recent major points" you're specifically talking about your own recent major points. Just clarifying because it sounds like you're asserting points that I don't believe are universally agreed upon. Some specific responses to new points that I haven't seen before upthread... bq. The proposed implementation, putting CA private certs in HDFS, is a very bad idea (it undermines the "authority" part of the term CA) Really? All it's saying is that anyone with the password to decrypt the key _is_ the authority. I don't believe there's anything fundamental about the concept of "authority" that requires they only work from one physical machine. As it is, if you have the instance secret, you can do whatever you want with the accumulo cluster. The root of trust has to start somewhere, and for the rest of accumulo, at the moment, that root of trust is the filesystem security on the site config. I don't see why it would be a problem for the same to be true for the SSL trust. bq. init-ssl would be useful, but if added, it can easily wrap keytool or openssl, rather than custom provisioning code Why is wrapping keytool or openssl better than wrapping bouncycastle? The interfaces are pretty much the same, except that BC can be pulled in as a maven dependency and doesn't require a brittle connection to tools separately installed on the system in varied versions and locations.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1009
17551	ACCUMULO-1009	Ok, in an effort to unblock this changeset from the provisioning issue (which I'll file as a separate issue), I've attached a new patch where CertUtils is pulled out of server and minicluster has no capability to generate its own certs. I know [~ctubbsii] wants to switch to using keytool-maven-plugin for the provisioning in our integration tests, but it doesn't actually support cert generation without JDK 1.7, and my understanding is that we want to stay 1.6 compatible for the time being. (It's also not clear that it supports generating self-signed certs without external tools even then.) So, for now, I just moved CertUtils (and the corresponding bouncycastle deps) into a test-only scope. I've also included an \@Ignored test of our support for SSL config through JSSE system properties, however, at the moment it appears that setting JSSE system properties breaks ZK connections. This seems likely to be related to ZOOKEEPER-1554, but I'll do some more investigation and comment over there. So, I know [~ctubbsii] was pretty insistent that we support JSSE config, but should we include it even though we know it won't work, in anticipation of the ZK issues getting resolved in the future, or should we pull the support completely until there's a chance of it actually working?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1009
17552	ACCUMULO-1009	bq. I haven't looked at every line of code yet. .... do you plan to? o.o	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1009
17553	ACCUMULO-1009	Sure, eventually. Don't let me be the hold-up, though. Why don't we drop it on ReviewBoard, so we can get multiple eyes on? [~busbey] seems to have been pushing to use that a bit more.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1009
17554	ACCUMULO-1009	Is this ready to go now? I have a patch, which I will attach, with attribution to [~mberman] which applies to 1.6.0-SNAPSHOT.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1009
17555	ACCUMULO-1008	I fixed up the tarball to lift the gen-* stuff out of proxy/target and put it in proxy/thrift. I also realized that the reactor was building proxy after assemble, so if you had a clean workspace, you wouldn't get anything but the java files for the proxy in your tarball. I did not address the blanket inclusion of **/*.py which causes some extra cruft to show up (e.g. core/target, trace/target, proxy/target etc) I'm not sure about the deb or the rpm though as I'm not on a debian/redhat based distro. Could you verify that both are actually packing the proxy stuff as intended, [~vines]? (I think you worked on that stuff most recently? If not, then whomever)	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1008
17556	ACCUMULO-1008	So the deb still builds correctly for debian, but I'm not familiar with the proxy. How do I start it and what's the best way to test it?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1008
17557	ACCUMULO-1006	{{VisibilityParseException}} gets thrown in the code in three places in one method, none of which I'm sure are actually possible. The first two times are cases where we end up with an AND/OR node that has fewer than two children, but this is impossible to construct without running into a BadArgumentException in {{ColumnVisibilityParser.parse_(byte[])}}. The last case happens when the node type is not one of the types defined in the enum, which will only happen if somebody changes the code to make it possible. One _other_ way that this might happen is if somebody decides to extend {{ColumnVisibility}} because it is not {{final}}, but that has wire implications that I'm not prepared to think about yet. If Christopher is correct that VPE never gets thrown (and I think he is), then what is the intent of this JIRA?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1006
17558	ACCUMULO-1003	I understand that it's to provide alternative serialization methods, but we already have the extra level of indirection in the SecurityToken. If I want faster/better serialization, can't I just use a new class? And since hadoop already has a mechanism for substituting different classes for Writables, we can leverage that infrastructure for future improvements. For example, we've replaced the implementation of the objects written to the WAL between releases by updating the classes and providing the Hadoop library with the translation. This just looks overly complex. That's fine if it has a point.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1003
17559	ACCUMULO-1000	Could this be a family of iterators that implement the compare and set semantics, or is this meant to be resolved at insert time (AKA read-modify-write)?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1000
17560	ACCUMULO-1000	From the mailing list: {quote} In the design document I suggested a method called putCondition() and if the value was null, thats mean that the user expected it to be absent. I don't really like that API for specifying expected absence. {quote} Could we do this as an additional method instead? relying on null for special API behavior smells like it'll lead to unexpected behavior if users mess up. {code} /** * Specify that a given cell must not exist */ void putConditionAbsent(CharSequence cf, CharSequence cq, ColumnVisibility cv) {} {code} And then putCondition can assert all non-null arguments.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1000
17561	ACCUMULO-1000	Would we want a conditional compare and delete analogues as well?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-1000
17562	ACCUMULO-1000	bq. Would we want a conditional compare and delete analogues as well? ContionalMutation will extend mutation, so the following would be supported. {code:java} ConditionMutation cm; cm1.putCondition(X); cm1.putDelete(Y); {code}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1000
17563	ACCUMULO-1000	Also, we should avoid leaking information about data being present at a level the user can't see. If visibility is really a part of the key, then as far as a user with only access FOOBAR is concerned, a cell with vis CATSDEE doesn't exist and the absence test should reflect that. Unless there's a different API already that lets a user say "Given these Auths, can I read everything in column X.Y.Z?"	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1000

#	Requirement	Questions	Answered	Successfully Answered	URL
17564	ACCUMULO-1000	It seems the implementation Keith gave is for compare and swap, not compare and set. This means that my pre-commit check is an equality operation, which may not be enough. One example that's always used is a bank account- when another person makes a charge to a bank account, they don't necessarily care that the account balance is the same as some initial check (ie, you said you have $100 but the bank says you have $90), I only care that the amount covered by the charged exists in the bank account (ie, this gumbo cost $50 and you have $90, you may pass go). I think we could hammer in this functionality by using an iterator that checks the precondition and returns a boolean- have you thought about how to add in that to {{ConditionalMutation}}?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1000
17565	ACCUMULO-1000	bq. One last thing, I am thinking of renaming putCondition() and putConditionAbsent() to putEqualityTest() and putAbsenceTest(). I initially found Test to be more confusing than Condition. What about ifExists(cf, cq, cv, val) and ifAbsent(cf, cq, cv)? That would provide a good semantic flow: cm.ifExists, cm.put. An alternative to ifExists could be ifMatches. I confess I don't have a full grasp of the use cases for this; would we ever want to test ifExists(cf, cq, cv)? Regarding the absence test with non-visible keys, maybe we should just let the test pass. Maybe the conditional writer should only allow writing visibilities that can be seen by the set of authorizations used for reading. You could use the same conditions with different authorizations to insert otherwise identical keys with different visibilities.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1000
17566	ACCUMULO-1000	bq. I think we could hammer in this functionality by using an iterator that checks the precondition and returns a boolean- have you thought about how to add in that to ConditionalMutation? My only thoughts about iterators so far is that the check will be done on the server side by reading the data through the iterator stack configured for the table. I suppose the ConditionalWriter could be configured to use iterators just like the scanner can. This made me think that ConditionalWriter could extend ScannerBase, took a look at the API most of the methods make sense except for iterator().	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1000
17567	ACCUMULO-1000	[~billie.rinaldi] and [~busbey] you both made comments about auths and vis, did the example w/ auth "A" and col vis "B" address your concerns? Want to make sure we are not talking past each other. bq. #1 seems most supportable, since it makes clear that you're only checking what you're allowed to see. As a bonus a change from required -> optional would be non-breaking, but not vice-vers good point. I am going to go w/ that option for now in my prototype. If anyone wants to see my client side prototype let me know. Once the discussion settles for a bit I will post another revision of the design doc.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1000
17568	ACCUMULO-1000	Can you put it up on the gitchubs or bitbucket?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-1000
17569	ACCUMULO-1000	bq. Ah, yeah that makes sense now. Presumably an IllegalArgumentException? When a batch of conditional mutations is passed to the conditional writer, can not throw an exception. Need to know the status of each one. I am thinking of adding something to the status enum, just not sure what to call the enum. bq. Can you put it up on the gitchubs or bitbucket? https://github.com/keith-turner/ACCUMULO-1000 [~busbey], I like the Cell proposal. I also agree w/ your arguments for not using it. bq. This might just be my bias against Object creation in Java. Thats a good bias to have (if only there were some safe way to allocate objects on the stack). Normally I would agree w/ this, but I am thinking in this case the operation (lock row on server side, read, maybe update) is so expensive that it possibly dwarfs this concern. However in the case where data is cached in the tserver its not as expensive. bq. the unwrapped version has the advantage of looking more like other methods used in Mutation. Agreed, consistency is very important. For me this is the main argument for not using the Cell+Test design. Changing the API for mutation is not really an option. [~bills] I just fully understood the significance of your earlier comment w.r.t API. Users will be able to do any check they like using iterators. Therefore we do not need to anticipate future mutation conditions besides equality and presence.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1000
17570	ACCUMULO-999	are we suggesting this would be a contrib?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-999
17571	ACCUMULO-999	[~kturner], would the goal of having Accismus as a contrib be to foster a community of its own (so that it can eventually stand as its own project) or is the idea to intertwine the development of Accumulo and Accismus such that at some future point they would merge? If the former, why not foster that community within the Incubator?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-999
17572	ACCUMULO-998	Just to clarify the scope of this feature, is it encryption at the database level, user level, table level, locality group, etc? It appears to me that creating an encryption codec and plugging it into the HDFS layer is what is being suggested for 980 and 981, which would be database level I think. Why is the implementation for 958 not the same?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-998
17573	ACCUMULO-998	Mike, thanks for the PDF-- very concise. In the known default properties table, between {crypto.secure.rng} and {crypto.default.key.stragegy.hdfs.uri}, the text is mangled for me in Chrome, Preview and Goodle Docs. Can you hook us up with a new version that has that info?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-998
17574	ACCUMULO-998	I have updated the encryption patch with a few improvements: 1. It works against trunk cleanly again. It had gotten stale. 2. We discovered a bug in our own internal testing where certain block caching situations would result in an encrypted stream not being correctly created. That bug has been fixed in this patch. How can we move forward on getting this patch applied?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-998
17575	ACCUMULO-998	Should this be fixVersion 1.6.0 and closed? What work on it remains?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-998
17576	ACCUMULO-997	Should this have also removed "logger" as an option?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-997
17577	ACCUMULO-996	What do people think about doing the following in the proxy instead of always passing user pass? {code} struct ProxyToken { long token; } ProxyToken authenticateUserPass(UserPass up); ProxyToken authenticateKerberose(KerberoseToken kt); i32 addConstraint (1:ProxyToken token, 2:string tableName, 3:string constraintClassName) {code} This would allow the proxy to use different authetication mechanisms. The token woudl be transient, generated using secure random, and time out when inactive.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-996
17578	ACCUMULO-996	bq. Another option is to leave the client api pre-259, and just make the server side have the pluggability, so we don't end up changing the authentication token types in quick succession. I spent the majority of my time on the server end, and unfortunately it's showing in the code. I still have not had a change to make a comprehensive review of this yet, its on my todo list. But what types of configurations were you hoping to support? Below are some possibilities. Do you feel the current API would support these? * Kerberose + LDAP * Username/pass + LDAP * Username/pass + Zookeeper * PKI + LDAP I just opened ACCUMULO-1009. Are there standard ways for doing PKI authentication other than SSL? If not then that may push PKI off til 1.6, but we would still want to think through the API implications as much as possible now. For example in the end we may want a connection factory that can produce authenticated (and possibly encrypted) connections to ACCUMULO servers. Users could supply this connection factory to Accumulo configured however they like.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-996
17579	ACCUMULO-993	What else is needed for this ticket?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-993

#	Requirement	Questions	Answered	Successfully Answered	URL
17580	ACCUMULO-980	Some comments on proposal V1. It seems like the IV would be transparent to RFile, it would just be encryption header information associated with a block. Just like each gzip block probably has some header. From RFiles perspective it just needs to be able to read and write blocks of data. When the encryption codec is not used, there is no per block IV. Does this sound correct? Taking this a step further, should encryption be pushed into BCFile? Currently RFile has no concept of compression, is just reads and write blocks of data to BCFile. BCFile handles compression and stores compression metadata like what codec to use for reading. Even RFiles own root meta block is stored as a regular BCFile meta block and compressed like everything else. Seems like modifying BCfile rather than RFile may be easier. I have already modified BCfile to support multi level indexes in 1.4. BCFile was copied because it was package private, but was not modified for a long time. Why is another interface needed? Why not use org.apache.hadoop.io.compress.CompressionCodec? Not saying we should or should not do this, but would like to hear your thoughts since you have looked into this. I see some things in the design doc that I suspect influence this decision, like needed to set Key and IV. While thinking about this I remembered the BigTable paper mentioned using two compression codecs in series. In the past we have not supported rolling upgrade from 1.x to 1.(x+1). Would only need to consider this if 1.6 supported it. Changes in the file format would be a small part of a larger effort to support rolling upgrade. Releases to date could always read a file produced by any previous version. So Accumulo 1.4 can read rfiles produced by any previous version of Accumulo. Is there any concern with storing unencrypted blocks in memory? The code currently caches uncompressed blocks (but still serialzed with RFile encoding) in memory. Would this be a concern in case these cached block are swapped out? Would we want to keep blocks encrypted in the cache and decrypt only as needed?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-980
17581	ACCUMULO-980	bq. and another that is then used by the WAL file streaming, Is there some reason the WAL encryption could not use a compression codec?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-980
17582	ACCUMULO-980	Are you considering rekeying? I.e. encrypt new files key with new key and read old files key with an older key. Do you have any thoughts on key management? I was thinking that each tablet could have a key. The tablets key is encrypted with the table key. The tablet key is used to encrypt/decrypt file keys. A tablet never has to know the table key, it could ask a centralized service to decrypt its tablet key using the table key. Using this method, the table key would only need to be held in memory on one machine.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-980
17583	ACCUMULO-980	The design I'm seeing here is that each RFile will have its own encryption key embedded with in its own crypto header block. That key (call it an RFile encryption key) will be in turn encrypted to a different key handled by an outside entity (this is where that SecretKeyEncryptionStrategy class comes into play). Should that external key become compromised, then *presumably* the only thing that needs to be rekeyed is the RFile encryption key; however, I don't think HDFS works that way, because one can only write a file once, correct? If you really wanted to, you could "rekey" the RFile encryption key by creating a new copy of the RFile with its encryption key decrypted by the old key and re-encrypted to the new key. The rest of the RFile would not have to be decrypted and re-encrypted but the file would presumably have to be copied. If this were a grave concern, then the way to solve it would be to make the crypto block an external file to the RFile rather than something embedded inside it. The only problem with that structure is the possibility of the RFile becoming separated from its companion crypto block, and general untidiness putting lots of little files everywhere causes. Since these files generally aren't dealt with directly by users or administrators, maybe this is the direction to go?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-980
17584	ACCUMULO-980	bq. Actually, it will always do this, as each file has a separate key. I realize this, because each RFile has its own internal key encrypted with an external key. I was wondering about this external key, if you could have different ones for reading and writing. Need to establish some firm terminology for the different classes of keys, so discussion is clear. Maybe add something to the proposal naming each key type and defining it. Then that name could be referenced in discussion. bq. Overall, then, Keith, does the proposal make sense? Seems workable? What you are proposing for RFile sounds good. It would be nice to outline how you are thinking of integrating this rfile capability into Accumulo. I suppose these are some of the questions that I have been asking. When a major compaction happens, how does it get its keys? What does that interaction look like?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-980
17585	ACCUMULO-980	bq. Is there some reason the WAL encryption could not use a compression codec? Keith, could you expand on your suggestion that a compression codec could be used for WAL streaming encryption? The encryption would be much more reusable if we could do it all in a codec. What do people think about the encryption codec patch attached to HADOOP-9333? Could that be adapted for our purposes?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-980
17586	ACCUMULO-973	Integrated in Accumulo-Trunk-Hadoop-2.0 #3 (See [https://builds.apache.org/job/Accumulo-Trunk-Hadoop-2.0/3/]) ACCUMULO-973 Remove trivial warnings about imports, and added missing hashCode() implementations for objects that override equals(), to be nice to users. ACCUMULO-971 Fix some malformed javadoc return tags, and errors linking to hidden (protected) methods (I don't know why javadoc cares about these). 17590	ACCUMULO-963	Why is this Won't Fix? I think BucketCache is still worth a look: http://www.n10k.com/blog/blockcache-showdown/	1	0	https://issues.apache.org/jira/browse/ACCUMULO-963
17591	ACCUMULO-962	It appears the the scanner that is pulling !METADATA table information is pulling in data beyond the keyextent requested. I tweaked the range computation, and added some additional debug: {noformat} 2013-01-15 15:59:12,338 [impl.ThriftScanner] DEBUG: Starting scan tserver=127.0.0.1:9997 tablet=!0;~;!0< range=[2;64af4f0d844d0e1c : [] 9223372036854775807 false,2;64af4f0d844d0e1c%00; : [] 9223372036854775807 false) ssil=[] ssio={} 2013-01-15 15:59:12,339 [tabletserver.TabletServer] DEBUG: ScanSess tid null !0 142 entries in 0.00 secs, nbTimes = [0 0 0.00 1] 2013-01-15 15:59:12,339 [util.MetadataTable] DEBUG: KV 2;64af4f0d844d0e1c;64ac083126e985b6 2;64af4f0d844d0e1c future:13c397780374fe2 [] 229776 false 127.0.0.1:9997 2013-01-15 15:59:12,339 [util.MetadataTable] DEBUG: KV 2;64af4f0d844d0e1c;64ac083126e985b6 2;64af4f0d844d0e1c srv:dir [] 29521 false /t-00007l9 2013-01-15 15:59:12,339 [util.MetadataTable] DEBUG: KV 2;64af4f0d844d0e1c;64ac083126e985b6 2;64af4f0d844d0e1c srv:lock [] 29521 false tservers/127.0.0.1:9997/zlock-0000000000$13c397780374c3b 2013-01-15 15:59:12,339 [util.MetadataTable] DEBUG: KV 2;64af4f0d844d0e1c;64ac083126e985b6 2;64af4f0d844d0e1c srv:time [] 29521 false M0 2013-01-15 15:59:12,339 [util.MetadataTable] DEBUG: KV 2;64af4f0d844d0e1c;64ac083126e985b6 2;64af4f0d844d0e1c ~tab:~pr [] 29521 false ^A64ac083126e985b6 2013-01-15 15:59:12,339 [util.MetadataTable] DEBUG: KV 2;64af4f0d844d0e1c;64ac083126e985b6 2;64b295e9e1b09682 loc:13c397780374f85 [] 209076 false 127.0.0.1:9997 2013-01-15 15:59:12,339 [util.MetadataTable] DEBUG: KV 2;64af4f0d844d0e1c;64ac083126e985b6 2;64b295e9e1b09682 ~tab:~pr [] 29516 false ^A64af4f0d844d0e1c {noformat} Why would a range of [2;64af4f0d844d0e1c, 2;64af4f0d844d0e1c%00) return a Key with row 2;64b295e9e1b09682 ?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-962

#	Requirement	Questions	Answered	Successfully Answered	URL
17592	ACCUMULO-958	Why do this for just walogs and not files? Would the cypherstreams handle sync/flush properly?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-958
17593	ACCUMULO-958	I was still under the impression that a ticket owner was responsible for reviewing and applying contributor patches. Did we change our methodology for this?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-958
17594	ACCUMULO-958	For future record then, how long is appropriate? Because then it's worth mentioning for any future feature freezes that patches need to be in X time earlier to be brought it.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-958
17595	ACCUMULO-958	Isn't there already an extension mechanism for FileSystem? Replace the FileSystem with a new kind of FileSystem which will de/encrypt data as it is read or written.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-958
17596	ACCUMULO-958	If this is going to make it in to the existing code (and stay), however polished it will be by the next release, I'd like to see it clearly marked as experimental, until it is available as a complete and coherent framework for encrypting table contents. So, I suggest moving the relevant classes into an "experimental" sub-package, and minimizing references to them in other code. I looked for a built-in "@Experimental" annotation, but couldn't find one, so we could create one for this sort of thing (but I still prefer the sub-package until it is no longer experimental). I do *not* think that they should be marked as "@Deprecated" because that implies a completely different point in the life cycle of the code (in fact, it implies the opposite end of that life cycle). That said, what exactly are the next actions, and the timeline for polishing this feature? From the previous comment, I gather "tests", and "tidiness" (which I interpret to mean QA refactorings, but not functional changes that incorporate critical feedback). Are there more anticipated actions that I've overlooked?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-958
17597	ACCUMULO-958	Since the interface has changed in this new patch, should we revert the first patch for 1.5?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-958
17598	ACCUMULO-958	Are you doing encryption before or after compression? It seems like that could be important. Presumably the data will compress better before encryption.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-958
17599	ACCUMULO-957	I like this. Can the commit of this ticket include putting the state diagram in the master comments in one of these?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-957
17600	ACCUMULO-956	I not sure there is a problem. The KeyTransformingIterator transforms only single keys, so you can't do any aggregation. If you had some kind of aggregating iterator on top of it on the stack, it would need to read enough keys from its source to do the aggregation. To produce your example, I think you'd have to scan all the cf: keys from the source to know it has what it needs for r cf: even [v2, v4]. Since that iterator would be scanning its source, there is no problem with the stack getting torn down and re-seeked. Or am I missing something?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-956
17601	ACCUMULO-956	The latest patch looks good. I was thinking of commiting and then making some further modifications. Was there anything else you wanted to do?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-956
17602	ACCUMULO-955	Integrated in Accumulo-Trunk-Hadoop-2.0 #5 (See [https://builds.apache.org/job/Accumulo-Trunk-Hadoop-2.0/5/]) ACCUMULO-955 Made BatchWriterConfig Writable, so it can be stored in a job's configuration in a human-readable way. Updated AccumuloOutputFormat to use it, and added unit tests for ACCUMULO-706 and ACCUMULO-955. Added an additional check for a reasonable minimum maxMemory value. (Revision 1435013) Result = FAILURE ctubbsii : Files : * /accumulo/trunk/core/src/main/java/org/apache/accumulo/core/client/BatchWriterConfig.java * /accumulo/trunk/core/src/main/java/org/apache/accumulo/core/client/mapreduce/AccumuloOutputFormat.java * /accumulo/trunk/core/src/main/java/org/apache/accumulo/core/util/shell/commands/DeleteCommand.java * /accumulo/trunk/core/src/main/java/org/apache/accumulo/core/util/shell/commands/InsertCommand.java * /accumulo/trunk/core/src/test/java/org/apache/accumulo/core/client/BatchWriterConfigTest.java * /accumulo/trunk/core/src/test/java/org/apache/accumulo/core/client/mapreduce/AccumuloOutputFormatTest.java * /accumulo/trunk/examples/simple/src/main/java/org/apache/accumulo/examples/simple/mapreduce/TeraSortIngest.java * /accumulo/trunk/server/src/main/java/org/apache/accumulo/server/test/continuous/ContinuousMoru.java	1	1	https://issues.apache.org/jira/browse/ACCUMULO-955
17603	ACCUMULO-955	Integrated in Accumulo-Trunk #647 (See [https://builds.apache.org/job/Accumulo-Trunk/647/]) ACCUMULO-955 Made BatchWriterConfig Writable, so it can be stored in a job's configuration in a human-readable way. Updated AccumuloOutputFormat to use it, and added unit tests for ACCUMULO-706 and ACCUMULO-955. Added an additional check for a reasonable minimum maxMemory value. 17604	ACCUMULO-952	Could possible just make the command fail if it would create tablet with over a certain number of files. The user could override this with the -f option maybe.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-952
17605	ACCUMULO-948	We could change the log level on these message to debug. I think its warn now. Or maybe we can log a debug in some cases and warning in others. Curious what is triggering these for you. Is it an invalid config or an empty dir?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-948
17606	ACCUMULO-948	So the screwy config should be removed. That leaves us with the non-existant dir, should we warn about this? I am thinking we should. Whats the use case for having the config point to a non-existant dir?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-948
17607	ACCUMULO-936	Is this fixed by ACCUMULO-926?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-936
17608	ACCUMULO-935	I think the most appropriate place to stage a runnable Accumulo distribution in one's workspace (helpful for developers) is probably in the assemble/target directory. This would simplify much of the pom files that store artifacts in "../lib". Instead, the assemble project can simply depend on the modules it assembles, and use copy-dependencies to stage things in assemble/target/accumulo_home/lib. This eliminates a lot of additional configuration being done that assumes all modules are checked out and being built together, and removes complexity in plugin configurations to specify their output directories.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-935
17609	ACCUMULO-935	Won't this break the ability to run directly off of the classfiles? Or at least make it a giant headache to do so?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-935

#	Requirement	Questions	Answered	Successfully Answered	URL
17610	ACCUMULO-935	How do you use the new builds? Does it wipe out everything in the directory you specify and drop in the new files, so that you need to reconfigure the dev instance when you build?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-935
17611	ACCUMULO-927	What about a case in which I have my-code-1.0.jar deployed. I then find a problem in my code, cut a new version and deploy my-code-1.1.jar. Say in version 1.1, I have a class in which I added a new method that did not exist in 1.0. Wouldn't I have undefined behavior (my class in 1.0 or 1.1 could be used by Accumulo) if the 1.0 classes aren't removed completely? bq. I don't think it will be common that folks delete jars from HDFS without restarting Accumulo as the classes that are loaded from that jar will still be resident in the VM.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-927
17612	ACCUMULO-927	But your v1.0 class would still be loaded in the VM. I don't think there is a guarantee as to when classes get unloaded from the VM assuming that you have enabled those options. Your scenario would only work if the class was in a different package. You could however deploy the jar to a new location and set the table context to the new location. 17614	ACCUMULO-925	Why can't it read the pid file dir out of the env file on the remote box?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-925
17615	ACCUMULO-925	Is there a reason why we can't apply this back to 1.6?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-925
17616	ACCUMULO-925	bq. Is there a reason why we can't apply this back to 1.6? Should probably have a discussion about it -- need to consider the impact on user automation around our scripts. We haven't really identified how the scripts should be covered by our compatibility statement (we have nothing about them now which is probably negligence). My gut reaction is that it wouldn't be worth it, but I'm not against someone doing the work to backport it (as long as we're sure we don't break scripts). It also would require the .out/.err file rotation (or at least splitting that logic out). IIRC, the hope was that usage of the existing start/stop-server and start/stop-all scripts didn't change, but I don't remember enough to say it is definitely compatible.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-925
17617	ACCUMULO-923	How do I programmatically set a table property? I want to set Property.TABLE_LOAD_BALANCER so that I can have a test balancer class which throws an exception in specific situations. I need to enable "configuration.getTableConfiguration(table).get(Property.TABLE_LOAD_BALANCER);" to return the specific mock class needed for each unit test. This would enable me to write unit tests ensuring the table name is in the exception messages.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-923
17618	ACCUMULO-918	Integrated in Accumulo-Trunk-Hadoop-2.0 #46 (See [https://builds.apache.org/job/Accumulo-Trunk-Hadoop-2.0/46/]) ACCUMULO-918 Added user iterator for visibilities. TODO: add a test. 17619	ACCUMULO-905	I was looking at the release notes for Java 7. Its up to update 10 now. I may have missed something, but the last release that had bug fix that seemed possibly concerning was u5. Some bug where the JVM would crash when PermGen was full, not sure if this bug was big deal or not. http://www.oracle.com/technetwork/java/javase/7u-relnotes-515228.html bq. There are known JDK 1.7 and zookeeper 3.4 issues. Can you elaborate?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-905
17620	ACCUMULO-905	I believe they were released a day or 2 ago, 6u39 and 7u13 - http://www.webupd8.org/2013/02/oracle-releases-critical-update-for.html Was that the exploit you're thinking of? Also, this is server software, browser plugins are something I'm not that concerned about.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-905

#	Requirement	Questions	Answered	Successfully Answered	URL
17621	ACCUMULO-905	For Accumulo 1.5, if you test it against Java 1.7 and find issues please open bugs. I agree w/ Benson dropping support for Java 1.6 is a serious decision. We can easily produce class files that work against Java 1.6 and Java 1.7 as long as we do not utilize new Java 1.7 features in Accumulo 1.6. While using new Java features would be nice, would any of these new features be necessary? From a security standpoint, a user can use Java 1.7 without us producing class files that only work with Java 1.7.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-905
17622	ACCUMULO-905	In short, no. But how long is an appropriate time to wait before moving on, since EOL seems to be the incorrect timeframe.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-905
17623	ACCUMULO-905	bq. But how long is an appropriate time to wait before moving on, since EOL seems to be the incorrect timeframe. For Accumulo 1.6.0 if you are interested in switching to Java 1.7, I propose you call a vote on the issue. If not for Accumulo 1.6.0 then we can reconsider the issue for Accumulo 1.7.0.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-905
17624	ACCUMULO-905	Update: The last security patch for Oracle JDK was 2013-04-16 (1.6.0_45). And, it looks like OpenJDK hasn't had a tag for 1.6 in about 8 months. OpenJDK was dropped from Fedora in version 16 (currently Fedora is 18, nearing 19, on ~6 month release cycles). I'm not sure what OpenJDK 1.6 support looks like in the next major RHEL/CentOS/Ubuntu releases, but I know that OpenJDK 1.7 has been supported since RHEL/CentOS 6.3 (~June 2012). I think the Accumulo 1.5 line will be stable enough to sustain users slow to adopt a newer version of Java for the foreseeable future. I don't think we need to hold back use of newer features for this any longer, personally. However, Keith is right... we should call a vote on the dev list.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-905
17625	ACCUMULO-905	Are there any statistics about how many groups are using 1.6 versus 1.7? What is the government using? On Wed, May 22, 2013 at 11:53 PM, Christopher Tubbs (JIRA)	0	0	https://issues.apache.org/jira/browse/ACCUMULO-905
17626	ACCUMULO-902	Do you have a use case? In the meantime, separate thread pools seem nearly ideal to handle a few fast minor compactions, and a queue of slower major compactions.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-902
17627	ACCUMULO-901	Does the master unload them all simultaneously or does it do it serially? If the former, then they shouldn't try to major compact before unloading. If the latter, perhaps we should introduce a majC halt as well.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-901
17628	ACCUMULO-898	We are talking about two distinct tasks now, right? First is to create an Storage implementation for Zipkin using Accumulo. Second is then to use Zipkin, and the Accumulo back-end from the first task, to instrument Accumulo code and store the traces to Accumulo. Am I following? I would like to help out somewhere if you think you could use it.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-898
17629	ACCUMULO-898	I got some quick and dirty code running using HTrace to log to Zipkin. Looks like they added a ZipkinSpanReciever to HTrace just the other week so this seemed like the easiest way to be able to push sample traces into Zipkin. I am sure it would be straightforward to convert the current Accumulo tracing code to push to a Zipkin collector too seeing as HTrace looks like they borrowed a lot of code from Accumulo tracing code. Have you by any chance started on the Storage implementation? I need to learn some Scala but as there are several Storage implementations to use as examples I guess it shouldn't be too hard. Let me know if you are interested in the HTrace example and I can share.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-898
17630	ACCUMULO-898	bq. The patch wouldn't apply cleanly with git am Is that due to whitespace errors? Those errors are in the generated thrift classes. Do we reformat those? bq. Since the SpanReceivers and related utilities are associated with the accumulo-tracer service, they should probably be moved there. I was worried about the dependency hierarchy there, since the jar containing the SRs will have to be added to the Hadoop classpath, and we probably don't want to be adding a bunch of jars. Though of course we don't really want there to be entire Accumulo modules with just a couple of classes in them either. Maybe it would be okay if dependencies on core and other modules don't creep into the SRs. bq. I'm not sure I understand the distinction in roles the SpanReceiverHost is supposed to serve, vs. the TraceUtil. SpanReceiverHost is kind of copied from Hadoop, from when we were planning to share the config, with the idea of switching over to using Hadoop's version at some point. But if we're not sharing config, there's no need to preserve it.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-898
17631	ACCUMULO-898	I've attached my current patch set, if you would like to compare. Can you re-assign this issue to yourself while you are working on it? Note that I got rid of the Hdfs wrapper classes, since HDFS has its own spans.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-898
17632	ACCUMULO-898	This is really cool. Does anyone know if someone is actively working on the Accumulo Storage implementation for Zipkin? I had started long ago (https://github.com/jaredwinick/zipkin/tree/master/zipkin-accumulo) but never came close to finishing.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-898
17633	ACCUMULO-895	Is there a reason that {{instance.dfs.dir}} requires the value to start with {{"/"}}?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-895
17634	ACCUMULO-895	bq. Is there a reason that instance.dfs.dir requires the value to start with "/"? I think the intent was to ensure it was an absolute path. It seems Path has an isAbsolute() method that handles windows paths. I will modify to use that.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-895

#	Requirement	Questions	Answered	Successfully Answered	URL
17635	ACCUMULO-895	Can run the {{ExampleAccumuloUnitTest}} now! Having issues with {{MapReduceExample}}, though. {noformat} ---- Running Mapred Against Accumulo UUID 1355244649903 81398c27-297e-4087-8ea8-ec0bdb976220 FLUSH 1355244659049 9144 24 1000000 1000000 FLUSH 1355244668456 9407 16 2000000 1000000 FLUSH 1355244680016 11560 27 3000000 1000000 FLUSH 1355244689021 9005 15 4000000 1000000 FLUSH 1355244703781 14760 13 5000000 1000000 [main] ERROR org.apache.hadoop.security.UserGroupInformation - PriviledgedActionException as:mike cause:java.io.IOException: Failed to set permissions of path: \tmp\hadoop-mike\mapred\staging\mike-101115261\.staging to 0700 Exception in thread "main" java.io.IOException: Failed to set permissions of path: \tmp\hadoop-mike\mapred\staging\mike-101115261\.staging to 0700 at org.apache.hadoop.fs.FileUtil.checkReturnValue(FileUtil.java:682) at org.apache.hadoop.fs.FileUtil.setPermission(FileUtil.java:655) at org.apache.hadoop.fs.RawLocalFileSystem.setPermission(RawLocalFileSystem.java:509) at org.apache.hadoop.fs.RawLocalFileSystem.mkdirs(RawLocalFileSystem.java:344) at org.apache.hadoop.fs.FilterFileSystem.mkdirs(FilterFileSystem.java:189) at org.apache.hadoop.mapreduce.JobSubmissionFiles.getStagingDir(JobSubmissionFiles.java:116) at org.apache.hadoop.mapred.JobClient$2.run(JobClient.java:856) at org.apache.hadoop.mapred.JobClient$2.run(JobClient.java:850) at java.security.AccessController.doPrivileged(Native Method) at javax.security.auth.Subject.doAs(Unknown Source) at org.apache.hadoop.security.UserGroupInformation.doAs(UserGroupInformation.java:1093) at org.apache.hadoop.mapred.JobClient.submitJobInternal(JobClient.java:850) at org.apache.hadoop.mapreduce.Job.submit(Job.java:500) at org.apache.hadoop.mapreduce.Job.waitForCompletion(Job.java:530) at org.apache.accumulo.server.test.continuous.ContinuousVerify.run(ContinuousVerify.java:216) at org.apache.hadoop.util.ToolRunner.run(ToolRunner.java:65) at org.apache.accumulo.server.test.continuous.ContinuousVerify.main(ContinuousVerify.java:232) at org.apache.accumulo.instamo.MapReduceExample.run(MapReduceExample.java:43) at org.apache.accumulo.instamo.MapReduceExample.main(MapReduceExample.java:60) {noformat} Perhaps need to specify a mapred work directory in some conf before launching?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-895
17636	ACCUMULO-895	I figured out why it fails in Hadoop 2.0. The change below in Path makes it only perform Windows slash normalization if you're on a Windows system. I'm going to remove the Windows path test from PropertyTest until this get fixed. Think this is worth opening a Hadoop ticket? {noformat} static final boolean WINDOWS = System.getProperty("os.name").startsWith("Windows"); {noformat} {noformat} - if (path.indexOf("//") != -1) { - path = path.replace("//", "/"); - } - if (path.indexOf("\\") != -1) { - path = path.replace("\\", "/"); + path = StringUtils.replace(path, "//", "/"); + if (Path.WINDOWS) { + path = StringUtils.replace(path, "\\", "/"); {noformat}	0	0	https://issues.apache.org/jira/browse/ACCUMULO-895
17637	ACCUMULO-895	Can we not just use File.pathSeperator?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-895
17638	ACCUMULO-895	bq. These changes make MiniAccumuloCluster work on Windows. This is for Accumulo 1.4. Does anyone have an environment set up to build on Windows that can verify this patch fixes things? I'm a little scared to go down that path, personally.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-895
17639	ACCUMULO-894	Would it make sense to add this in an injectable way, with annotations? It seems like this is more future-proof, instead of changing the API. Alternatively it could be added as a final helper method to a base class, but I have a preference for annotations/injection for environment stuff like this.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-894
17640	ACCUMULO-894	Can somebody give an example of where this would be helpful?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-894
17641	ACCUMULO-891	Can you clarify how the API is making Authorizations seem immutable?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-891
17642	ACCUMULO-884	Do things break horribly if it's set in the client but not on the server? If not, we should also just set it in all of the examples.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-884
17643	ACCUMULO-884	Why was this bumped? I am under the impression that using it is just a documentation change? Sent from my phone, please pardon the typos and brevity.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-884
17644	ACCUMULO-884	bq. In my experiments on these solid state drives, enabling short-circuit reads more than doubled my read throughput! (TP measured in ops/s in a YCSB-derived read-only workload test.) If I remember correctly, I read somewhere that you won't see any benefit from shortcircuit reads until you actually get to hadoop-2 (maybe 0.23 too?). I'll see if I can find that information again... Interesting that you saw such a speedup. How influenced do you think your benchmark is by the YCSB workload itself? I did a bunch of testing early this year on spinning-disks with these parameters on 0.20 baseline and actually saw no performance gain trying to use the shortcircuit. I think I was also tweaking disabling checksums on local datanode reads. I think I had an even part read+write workload. JD had some info on HDFS-2246 but I'll leave it up to you to come to your own conclusions. Out of curiosity, in your read-only test, did you warm the Accumulo or OS caches before the test (or conversely, ensure they were cold)?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-884
17645	ACCUMULO-884	bq. Interesting that you saw such a speedup. How influenced do you think your benchmark is by the YCSB workload itself? Our test was specifically designed to do uniformly random reads across a dataset that wouldn't come close to fitting in memory. Additionally, it was on solid state drives so we would assume that the relative overhead of pulling data through HDFS (as opposed to short-circuiting) would be large compared to a spinning disk scenario. bq. Out of curiosity, in your read-only test, did you warm the Accumulo or OS caches before the test (or conversely, ensure they were cold)? I didn't do anything special to warm/empty OS or Accumulo caches. Anecdotally, there was a pretty obvious warmup curve in read TP over the first few minutes of the test whenever Accumulo was not already warm with this table.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-884
17646	ACCUMULO-884	bq. Given that this requires that we run as the same user as the data node Is that the case? I thought it could be any user, just only one user.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-884
17647	ACCUMULO-884	What is the deliverable for this ticket? Is it a page of documentation on our web site? Is it part of the Accumulo configuration? Can we specify what tests need to be run as part of the closure criteria?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-884
17648	ACCUMULO-884	[~mridley], would you be willing to take on the documentation changes from this ticket? Your results would make a good blog post, either directly on the accumulo project blog or syndicated there.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-884
17649	ACCUMULO-869	Some comments about patch #1 * If isolation is enabled, should the parent classloader be the java system classloader, instead of the classloader that pulls stuff from $ACCUMULO_HOME/lib * Should isolation be configurable per context?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-869
17650	ACCUMULO-868	To change the directory from /tmp to something else, then we need to change line 273 in AccumuloVFSClassLoader from {noformat} vfs.setReplicator(new DefaultFileReplicator()); {noformat} and pass in a java.io.File instance that references a directory. Are we going to default this to something and also make configurable? What about $ACCUMULO_HOME/tmp ?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-868

#	Requirement	Questions	Answered	Successfully Answered	URL
17651	ACCUMULO-868	If the cache dir is not configured I think we should place it in the system tmp dir. There is no good way to do this in Java (until Java 7). Could do something like the following {code:java} cacheDir = new File(org.apache.commons.io.FileUtils.getTempDirectory(), "accumulo-vfs-cache"); {code} The nice thing about FileUtils.getTempDirectory() is that it returns something reasonable for Linux, Windows, and Mac. Is it safe for the multiple processes to use the same cache dir?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-868
17652	ACCUMULO-868	What do we do for the logs directory? Can we put the cache dir inside the logs dir?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-868
17653	ACCUMULO-868	bq. What do we do for the logs directory? Can we put the cache dir inside the logs dir? The default for walogs and logs is $ACCUMULO_HOME. User are encouraged to change both. Another problem I have seen with ACCUMULO_HOME is its on NFS sometimes, which is not good for logs or cache. System tmp dir will be local and writable. I share your concern about tmp filling up, I have seen this happen and when tmp dir is in OS partition it can be a disaster. So I think tmp has the best chance of working out of the box for a new user, but could cause problems in the long term on production systems. We could put the property in the example config (like walog config), encouraging user to set it to something appropriate for their system. Default it system tmp so it works out of the box for new users, but make system admins cognizant of this config for production systems. Comment in the example config should point out that this propery only matters if using vfs classloader.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-868
17654	ACCUMULO-853	What's with the changes in CachedBlockRead?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-853
17655	ACCUMULO-842	Is there a way to describe this task more concretely so that others might attempt it? Can the work be phased? Why is this a bug? Can you estimate the difficulty level?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-842
17656	ACCUMULO-842	Damon, Thanks for the patch, I have a few comments. * I am not keen on having an option to run if the master lock is held. I think modifications to Fate ops should only run if the master lock is not held. If there is a buggy fate op thats stuck in an infinite loop, deleting it from the ZooStore will not necessarily kill the thread in the master. In the case a user would still need to kill the master. I would not want the user to get the impression that this shell command will clean up state in the master process, it will not. Also, could get strange behavior in the master from concurrent modification of zookeeper. I think always killing the master process is the safest option. Killing the master for a bit should not impact reads and writes to Accumulo, but it will stall table operations. * seems to duplicates some code in AdminUtil, consolidate? * TxFailCommand.prepFail() is a nice improvement, I think this could be moved to fate.AdminUtil and have shell call AdminUtil * TxDeleteCommand.prepDelete() should always delete, even its NEW or IN_PROGRESS. Consider a buggy fate op thats in progress and always gets stuck in an infinite loop when it tries to run. Maybe just use fate.AdminUtil.prepDelete(). * consider using shellState.printLines(), it does pagination, in TxPrintCommand * javadoc for TxPrintCommand wrong * I think I am slightly in favor of having one shell command with options, less clutter in the shells list of commands. Was there a reason you chose to create three commands? * Did you use the Accumulo Eclipse formatter? The formatting seems mostly correct, but I am seeing some slight diffs like extra spaces in parametric types. Its odd. * May want to consider making the current Admin command log a warning saying its deperecated and point users to the shell commands. For testing, you can pick a random fate op and add an infinite loop to it :)	1	1	https://issues.apache.org/jira/browse/ACCUMULO-842
17657	ACCUMULO-841	Are you sure? The xml file for security at one point set it. Sent from my phone, please pardon the typos and brevity.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-841
17658	ACCUMULO-841	Isn't the node counting necessary to support maximum hop?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-841
17659	ACCUMULO-839	Is anyone working on this issue or any other procedure which can enable search capabilities in Accumulo?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-839
17660	ACCUMULO-824	Where are the scripts located and where is the code to develop the packaging (the RPM)?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-824
17661	ACCUMULO-818	Dave, can you please assign a ticket to yourself when you begin working it? Memory serves that a Jira ticket with an assignee implies that someone is working on it. Thanks!	1	1	https://issues.apache.org/jira/browse/ACCUMULO-818
17662	ACCUMULO-818	John, Are you referring to the api change in 818 or the shell command in 967? I'm thinking you mean the api change, but want to be sure. Dave	1	0	https://issues.apache.org/jira/browse/ACCUMULO-818
17663	ACCUMULO-813	Was this related to dat with a bad visibility? If so, ACCUMULO-360 may help avoid the situation. ACCUMULO-918 and ACCUMULO-844 will help users deal with this situation should it occur. Handling issues that arise higer in the iterator stack is tricky, but not impossible. For a corrupt rfile, where the problem is detected in the rfile code, handling the situation should be more straightforward. Want to understand the issue you ran into more before working on it.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-813
17664	ACCUMULO-804	Hadoop isn't a compiled dependency. Couldn't we keep the default with 1 for compilation time, but have a testing procedure of some sort which exercises both?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-804
17665	ACCUMULO-804	Should that be another dimension of the example configs? It would be better if we didn't make users have to reconfigure the classpath.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-804
17666	ACCUMULO-804	We already have 8 sets, so this would make it 16? Might be a little excessive. How does Accumulo respond to directories in general.classpaths that don't exist? If that doesn't cause an error, we could just add the 2.0 classpaths into the existing examples and they'd work for both.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-804
17667	ACCUMULO-803	looks good a few comments. * can you make this patch against trunk/1.5 instead of 1.4? I do not think this is something we would want to add to 1.4. * the user manual would need some mention of this new feature, in docs/src/user_manual/chapters/table_configuration.tex I think * in MockTable I think you should subtract from Long.MAX_VALUE instead of Integer.MAX_VALUE for consistency, even though its an int is being subtracted	1	1	https://issues.apache.org/jira/browse/ACCUMULO-803
17668	ACCUMULO-803	As a thought exercise, let's think about how far this might go. Since Combiners work on a column family, does that imply that we might want a different timestamp scheme on different column families? Should this turn into another plugin framework for assigning timestamps on tablet servers, or perhaps a timestamp data definition language for column families?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-803
17669	ACCUMULO-803	bq. does that imply that we might want a different timestamp scheme on different column families? Currently each tablets timestamp is stored in the metadata table. It tablets had to persist and indeterminate number of timestamps, then I do not think we could safely store that in the metadata table. Would need to store it somewhere else. Its nice storing the info in the metadata table because you can atomically update the timestamp on minor compaction and bulkimport by putting it in the same mutation. So where would this info be stored and how would it be atomically updated after minor compaction and bulk import? Would also have to be careful not to blow out memory on tservers. e.g. If each tablet on a tserver is keeping track of timestamps for many columns in memory. Would need to cache timestamp info from persisted store to avoid this problem.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-803

#	Requirement	Questions	Answered	Successfully Answered	URL
17670	ACCUMULO-803	bq. Since Combiners work on a column family, does that imply that we might want a different timestamp scheme on different column families? We might also consider setting an option on mutations to reverse system set time. This gives users the ability to target this in very tailored ways. Users could apply it to certain column family prefixes, to column qualifiers, etc. It gives a lot of flexibility w/o any server side code. Could add something like the following to mutation. {code:java} enum TimestampTransformations { NONE, REVERSE } class Mutation { //transformation that will be applied to system set timestamps public void setTimestampTransformation(TimestampTransformations tt); } {code} I think the only drawback with this is that it does not support setting system time for bulk insert. The current patch will support that.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-803
17671	ACCUMULO-803	I like the setting of timestamp transformation in the Mutation, but do you think people might want to set multiple different transformations for different column updates in the same mutation?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-803
17672	ACCUMULO-803	bq. I like the setting of timestamp transformation in the Mutation, but do you think people might want to set multiple different transformations for different column updates in the same mutation? I like it too, but the bulk import aspect is still tormenting me. I was being miserly with computation and storage when thinking about setting it at the mutation level. Eric just modified mutation so that the system timstamp is set once per mutation. It used to set the same timestamp for each column. I wanted to maintain this slight boost in ingest performance. I suppose we could still set the timestamp once permutation and just interpret it differently if a flag is set for the column when getTimestamp() is called. For bulk import, if the user request logical time, it will set the same timestamp for all keys in the file. We could make it reverse this timestamp for all keys in the file. But I have not thought of a simple method for do something more granular. Seems like the two are options are modify the Key written by bulk import or modify the special iterator that sets timestamps on bulk imported files when they are read. Don't really like this options. But we don't have to support anything more granular for bulk import.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-803
17673	ACCUMULO-803	bq. do you think people might want to set multiple different transformations for different column updates in the same mutation? One more consideration. This would add another set of put methods to mutation, which already has alot of put methods.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-803
17674	ACCUMULO-803	I agree, I don't feel comfortable allowing users to set column family ordering on a per mutation basis. With the API you propose, do you feel that fifo ordering would be best achieved by manipulating timestamps as is done the original patch? If so, does this introduce any strangeness in the relationship between typeType and fifoColumnFamilies? Could it make sense to use TimeType.MILLIS and a fifo column family? Perhaps yes. I feel a little uncomfortable with the fact that column families are dynamic but we would require the user to specify a set of column families at creation time if they want fifo behavior. This seems to run counter to the spirit of column families (and how they're used) in Accumulo. One way to solve this problem would be to add setColumnFamilyOrdering(String cf, boolean fifo) (or something like it) to TableOperations. This might not be a good idea because we run into the same problem we have with Mutations: the user could shoot themselves in the foot if they set the ordering on a column family to be different than the default for a table that already contains data. So, I have to admit that I lean closest to the original mechanism, but I could be biased because I'm the patch author :) Thoughts?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-803
17675	ACCUMULO-803	I feel bad about bumping this to 1.7 because it got bumped to 1.6 with a patch. [~alfarris@prodigy.net] or [~kturner], is it possible for you to do a revised patch for 1.6?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-803
17676	ACCUMULO-802	Took a quick look at v2 patch. Had the following comments. * maybe only delete namespaces if empty... could make attempt to delete non-empty namespace throw an error (could have a force option) * verify namespace props on server side.. for example configure iterator on namespace then try scanning/compacting... test this w/ and w/o table overriding prop... * test that namespace props survive across namespace rename (a good random walk test would do this) * need to test import and export table w/ namespaces * uncertain about automatic creation of namespaces at table creation time... this may hide errors in user code * maybe support cloning namespaces, a shortcut to clone all tables in a namespace + copy namespace props * it would be nice if the unit test covered all operations that can now take a namespace, for example get scanner, batchscanner, etc using namepsace+table	1	0	https://issues.apache.org/jira/browse/ACCUMULO-802
17677	ACCUMULO-802	A few additions to the v2 patch: # Don't keep both a {code}{ZKROOT}/namespaces/{namespaceId}/tables{code} and a {code}{ZKROOT}/tables/{tableId}/namespace{code} It makes things more complex when we have to maintain two structures for the same information, and will result in an inability to determine which is the authoritative source consistently if they diverge (we had this problem with tables in ZK and in the metadata table awhile back). I prefer the latter, because I think the table's own configuration should be the authoritative source of who has additional configuration for it. # Make sure the bytes written to ZooKeeper from strings (table namespace IDs, namespace names), are written as UTF8 bytes, and read back as UTF8 bytes. (For example, in Tables.getNamespace(Instance, String);); Since we don't have JDK7's UTF_8 constant, use our own: Constants.UTF8. # (Optional) In the master.thrift file, please ensure that params in new methods have sequential param IDs (1,2,3...). It's easier to read, and that makes it easier to add new params to thrift RPC methods that is backwards-compatible. Don't change old methods, though. # Avoid adding javadocs that don't add value (example: '@throws Exception' param without a comment) # If you add a TODO, please include the Accumulo JIRA number in the comment so it can be tracked (example: '// TODO security check (ACCUMULO-1479)') # Update the WIRE_VERSION to 3, and put the upgrade code in the if block. The data version was already incremented to account for the root table separation, so any upgrade checks based on the data version should work seamlessly. I'm adding [^ACCUMULO-802.v3.patch] with some of my recommendations.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-802
17678	ACCUMULO-790	When RFile was created not only was the file format considered, the end to end data process from client write to client read was also considered. The encoding that is utilized in RFile is also utilized to send data over the wire. RFile allowed much faster read than MapFile, but that speedup would not have mattered as much if the data could not be sent over the network faster. See Key.compress() and Key.decompress(). If these changes further speed up read rates, can we do something to speed up transfer rates? There may be nothing to do, but its something we can experiment with.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-790
17679	ACCUMULO-786	Looking at the commit just made, I think we should restructure the code to have mutation class in the server code. The server side Mutation could extend the client side mutation and add setSystemTimestamp(). The client code should not have setSystemTimestamp(). Also there is no reason for thrift to transfer the system time stamp that the user should never set. Should probably make the mutation members private instead of package private. I see this was done for testing, but can this be accomplished with the public API?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-786
17680	ACCUMULO-780	Are you proposing getting rid of all of the sample configs and having a script that ask some questions and generates an initial set of configs?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-780

#	Requirement	Questions	Answered	Successfully Answered	URL
17681	ACCUMULO-780	Can we build this functionality into the monitor? Maybe turn it into a management tool? Or are the security implications too dire? I'm picturing some kind of stacked bar chart where each process on a given server is one section of the stack. The stack being available RAM on the server.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-780
17682	ACCUMULO-780	If this is a proposed feature for 1.6.0, what are we going to do about ACCUMULO-1401 in 1.5.[0-9]+ fixes?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-780
17683	ACCUMULO-780	Thanks for the patch! We might need to discuss if Accumulo 1.7.0 will still have Hadoop 1 support, which could impact your patch, but that's best left for another day. A few other thoughts: bq. +\t-h --hlep\t print this help message\n" Typo. :) {quote} +echo $bin +echo $SOURCE {quote} Is this left over from debugging? If so, it should be removed. Is {{getopt}} cross-platform? I generally prefer to see that to custom parsing.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-780
17684	ACCUMULO-780	I think the heuristics are a good idea, but it seems like they can be addressed in (more specific) follow on issues, can't they? [~vines]: I think the 3GB example that existed prior already suffered from that same problem, didn't it? The patch provided doesn't add any new options, except the choice of which hadoop flavor to use, which was previously just a commented-out option. I think to satisfy this ticket, without creeping too far into other issues, it would be sufficient to add an "Other" memory option and prompt for additional size options. I did see that [~John McNamee] had added a link to the ReviewBoard above.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-780
17685	ACCUMULO-780	bq. I think the heuristics are a good idea, but it seems like they can be addressed in (more specific) follow on issues, can't they? I thought this was the initial intent of this ticket. Does that mean that the scope of this ticket is to substitute Java, ZooKeeper and Hadoop home env vars into a template? I have no problem if the work is broken down into pieces (in fact, it would probably be nice for everyone), but I don't think what is currently targeted is sufficient to remove {{conf/examples/*}} completely.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-780
17686	ACCUMULO-780	If that is the intent of this ticket, then [~vines] should not have resolved ACCUMULO-1395 as a duplicate of this one. Do we want to reopen that one, have [~John McNamee] attach his patch to that, and leave this one open for the smarter heuristics? Or, do we wish him to apply his patch as part of this ticket, and create a separate one for those smarter heuristics?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-780
17687	ACCUMULO-775	Is the scanning something that can be simulated? I'm thinking that a simulation might show the new technique has a prediced x% speedup.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-775
17688	ACCUMULO-765	Question: if I bring back org.apache.accumulo.core.zookeeper.ZooCache and make it a trivial subclass of org.apache.accumulo.fate.zookeeper.ZooCache, should I also bring back {code:java} public static String lookupInstanceName(org.apache.accumulo.core.zookeeper.ZooCache zooCache, UUID instanceId) {code} or is the new lookupInstanceName that takes the fate ZooCache OK, since the core ZooCache extending the fate ZooCache should work in the new method?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-765
17689	ACCUMULO-765	bq. or is the new lookupInstanceName that takes the fate ZooCache OK, since the core ZooCache extending the fate ZooCache should work in the new method? It seems like the new method would be ok with the proposed extension. It would be nice to test it. Could compile code against 1.4 that uses that method, and then run the compiled code against 1.5.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-765
17690	ACCUMULO-759	One other thought I had, was to use negative priorities. I thought this was kinda ugly. Negative numbers are currently not allowed. Could continue to disallow negative numbers for table iterators and allow them for scan time iterators. Negative priorities would always be interpreted on the server side as "after all table iterators". If negative numbers were used, we would want to do that in such a way that the user never entered a negative number. Could add the following to IteratorSetting : {code:java} public static final int MAX_TABLE_PRIORITY = Integer.MAX_VALUE; {code} The code example I gave above would change to the following. {code:java} //assume conn and scanner are initialized somewhow, just want to show their type Connector conn; Scanner scanner; int tableMax = IteratorSetting.MAX_TABLE_PRIORITY + 1; //this is effectively Integer.MIN_VALUE scanner.addScanIterator(new IteratorSetting(tableMax++, "foo1", ".org.bar.FooIter")); scanner.addScanIterator(new IteratorSetting(tableMax++, "foo2", ".org.bar.BarIter")); {code} The above is ugly, but I just want to show my thought process. I think the code below is much less offensive from a user perspective. It does something screwy with negative numbers behind the scenes, but that is hidden from the user. {code:java} class ScanIteratorSetting extends IteratorSetting { public ScanIteratorSetting(String name, String iteratorClass) super(Integer.MIN_VALUE, name, iteratorClass); } public ScanIteratorSetting(ScanIteratorSetting predecessor, String name, String iteratorClass) super(predecessor.priority+1, name, iteratorClass); } {code} So now the code would look like this. {code:java} //assume conn and scanner are initialized somewhow, just want to show their type Connector conn; Scanner scanner; ScanIteratorSetting is1 = new ScanIteratorSetting("foo1", ".org.bar.FooIter"); //comes after all table iterators scanner.addScanIterator(is1); ScanIteratorSetting is2 = new ScanIteratorSetting(is1, "foo2", ".org.bar.BarIter"); //comes after all table iterators and after foo1 scanner.addScanIterator(is2); {code} Can we make the code for chaining iterators more compact and intuitive?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-759
17691	ACCUMULO-759	What if we went with a more immutable form of Scanner, which was more representative of the data set? This would allow things like: {code:java} Scanner allTheThings = connector.createScanner(...); ScanIteratorSetting aggregateEverything = new ScanIteratorSetting(MyAggregatingIterator.class,properties); Scanner aggregatedThings = allTheThings.transform(aggregateEverything); // scan over the table with the iterator for(Entry<Key,Value> aggregate: aggregatedThings) { ... } // scan over the table without extra scan-time iterators for(Entry<Key,Value> thing: allTheThings) { ... } {code} I think this might be an easier way for users to conceptualize iterators.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-759
17692	ACCUMULO-759	When you say IteratorChain, do you mean the one from Apache Commons Collections? If not, I would look at this package. There are some pretty cool features.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-759
17693	ACCUMULO-755	bq. I am using this Ant build script to run FindBugs. I was unable to get FindBugs working properly with Maven. What problems did you have? Perhaps I/we can work through the issues you had with the maven findbugs plugin. I'd much rather only require developers have one build system installed.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-755
17694	ACCUMULO-755	@josh - I think that mvn findbugs:findbugs creates a set of 7 findbugs.xml files. One in each module directory. The XML is not readable. The The HTML report is generated for site commands only. Reading http://kohsuke.org/2011/08/23/my-epic-battle-with-findbugs-maven-plugin-and-how-i-utterly-lost/ was demoralizing. That's when I created the Ant build file. @john - I want to facilitate everyone using findbugs even an Accumulo novice. Why bother with an IDE when it is not needed?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-755
17695	ACCUMULO-752	Thanks. Eric, can you elaborate on your suggestion? Shouldn't it be safe to assume that if the user wants a different file system that they will specify it in the file name using URI syntax? What if people begin leveraging the new method in old code where a conflict might occur? Under what conditions might that happen? How would you propose handling the current MockInstance constructor that doesn't take that argument?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-752

#	Requirement	Questions	Answered	Successfully Answered	URL
17696	ACCUMULO-752	So I'm still a little confused. On what filesystem, in your example, are /tmp/foo and /tmp/bar? Are you suggesting that the patch should limit interoperability to the local filesystem? Or that the default unqualified file system should always be the local filesystem and that people should have to use fully qualified paths if they want something else?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-752
17697	ACCUMULO-747	Is it asking for too much for all of them? Maybe enabling/disabling native maps should require a restart, but the rest of them look like they can be made configurable.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-747
17698	ACCUMULO-747	Where is the list of all properties? I expected to find it in in the user manual [1] but it didn't see one... [1] http://accumulo.apache.org/1.5/accumulo_user_manual.html#_configuration_2	0	0	https://issues.apache.org/jira/browse/ACCUMULO-747
17699	ACCUMULO-745	Please be more specific. Which utilities should read accumulo-site.xml? We should probably have one ticket for each to minimize the changes related to each.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-745
17700	ACCUMULO-745	{code} 11:40:36 runTest (simple.dynamicThreadPools.DynamicThreadPools) ..... ERROR:test.auto:This looks like a stack trace: Thread "org.apache.accumulo.server.test.TestIngest" died null java.lang.reflect.InvocationTargetException at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method) at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:39) at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:25) at java.lang.reflect.Method.invoke(Method.java:597) at org.apache.accumulo.start.Main$1.run(Main.java:90) at java.lang.Thread.run(Thread.java:662) Caused by: java.lang.RuntimeException: org.apache.commons.cli.UnrecognizedOptionException: Unrecognized option: --debug at org.apache.accumulo.server.test.TestIngest.parseArgs(TestIngest.java:165) at org.apache.accumulo.server.test.TestIngest.main(TestIngest.java:256) ... 6 more Caused by: org.apache.commons.cli.UnrecognizedOptionException: Unrecognized option: --debug at org.apache.commons.cli.Parser.processOption(Parser.java:363) at org.apache.commons.cli.Parser.parse(Parser.java:199) at org.apache.commons.cli.Parser.parse(Parser.java:85) at org.apache.accumulo.server.test.TestIngest.parseArgs(TestIngest.java:162) ... 7 more {code}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-745
17701	ACCUMULO-739	Since there seems to be a difference of opinion, can the visibility label syntax be pluggable?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-739
17702	ACCUMULO-739	Bringing this back around... There's a specific need on the part of a few users to add . and / in order to support hierarchical structure in labels. Can we settle on implementing this feature using the current whitelist approach and open a new ticket to discuss the long term strategy?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-739
17703	ACCUMULO-736	Given that all data retrieval from Accumulo is returned to the client via a Java Iterator, I'm a little confused about the application of such a feature. If you have many columns in one row, you'll get a Key-Value pair for each Row-Column at which point it's an exercise for the client not to consume more than can fit in its memory. Other applications seem to be solvable through a custom Accumulo Iterator. For example, if you want to fetch all columns for a row in one call in batches of size N, this is easily done with an Accumulo Iterator without any core changes. Please assume I'm an HBase API novice. Can you provide some more concrete details? Thanks.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-736
17704	ACCUMULO-732	Have you seen the output from 'hexdump -C'? Would that format also be useful?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-732
17705	ACCUMULO-730	Question: do we need to maintain compatibility with hadoop 0.20.205.0? I'm about to check in a patch for ACCUMULO-730. I decided to use the plain local job tracker with MockAccumulo (instead of MiniAccumuloCluster) since it's a bit more straightforward and we haven't planned to deprecate MockAccumulo yet. Either way involves adding a couple of dependencies to the poms to get it to work for all of 1.0, 1.1, 0.23, and 2.0. The only one added to the top-level pom is commons-httpclient, which seems fine. To get it to work for 0.20.205.0 as well, we would have to add a dependency on jackson. I'm reluctant to do so, but if someone needs 0.20.205.0, I will.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-730
17706	ACCUMULO-730	Are the added dependencies only needed for tests? If so, they should probably just be in the test scope, and not the default scope. If they are needed beyond unit tests, then disregard.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-730
17707	ACCUMULO-722	David, I browsed the CFS site. The first question on that page asks about the tricky part where there's only one writer to a file. This is a key problem, since having a single writer to a write-ahead-log is key for proper failure conditions. In particular, we must ensure that the writes by a failing tablet server to its write-ahead log are denied while we use that file for recovery. The response "HDFS does not implement posix semantics" is true, but it understates the importance of this feature to the HBase and/or Accumulo WAL. And, it appears this is not an open-source solution, so I'm unable to test it without committing additional resources. Does anyone know if they support exclusive writer semantics?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-722
17708	ACCUMULO-722	among recent changes in HDFS: * HA NameNode (HDFS-3077) * Pluggable locality / failure tolerances (HDFS-385, HADOOP-8468) * Improving scalability of namespace operations (HDFS-5389) and block location mapping (HDFS-5711) Could we please forgo this ticket in favor of interested parties working on relevant bits within HDFS?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-722
17709	ACCUMULO-720	Is this the file? core/src/main/java/org/apache/accumulo/core/iterators/user/RegExFilter.java	0	0	https://issues.apache.org/jira/browse/ACCUMULO-720
17710	ACCUMULO-718	This is done. Does anyone think we should keep the old static methods around?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-718
17711	ACCUMULO-708	Cool stuff, Dave. I assume the usage of the HDFS path "/accumulo" is based on the default value for the "instance.dfs.dir" parameter? Also, have you thought about modifying the assemble profile to load lib correctly and then modify `accumulo init` to auto-load the default jars into HDFS? In other words, have you thought about automating the above process through the maven profile and Accumulo initialization given the "classloader.vfs.enabled" and "classloader.vfs.context.classpath.system" parameters in accumulo-site.xml?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-708
17712	ACCUMULO-708	I scanned through the patch trying to get a sense of it at the high level. Tomorrow I will do a more in depth review. Have a few comments so far. * use general prefix for new config properties. general denotes its a configuration for all services (i.e. master, tserver, etc) * needs documentation. How does a user know this feature exists and what they can do with it? * probably should not use org/apache/commons/vfs2 package. If the commons project defines classes with same name and user loads Accumulo and Commons jar chaos could ensue. * I noticed there were a few accumulo site files introduced. Are these for testing? Some of them configured walog dirs which is no longer nesc in 1.5.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-708

#	Requirement	Questions	Answered	Successfully Answered	URL
17713	ACCUMULO-708	bq. •use general prefix for new config properties. general denotes its a configuration for all services (i.e. master, tserver, etc) I'll include in another patch, I'll wait for your other comments and roll all the changes up into a new patch. bq. •needs documentation. How does a user know this feature exists and what they can do with it? Where should this be documented? User guide, readme, etc? bq. •probably should not use org/apache/commons/vfs2 package. If the commons project defines classes with same name and user loads Accumulo and Commons jar chaos could ensue. Understood. I know for a fact that these classes don't collide with ones in Commons VFS. Code has also been submitted to VFS for inclusion in a future release (VFS-442). bq. •I noticed there were a few accumulo site files introduced. Are these for testing? Some of them configured walog dirs which is no longer nesc in 1.5. These are there for tests. I believe I copied the 512MB example site file and modified for my tests. The walog property is not used and the test will not fail if the directory does not exist as the servers are not started during the tests.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-708
17714	ACCUMULO-708	I applied the patch and have been unable to get the unit test to run. Keep seeing something like the following {noformat} Caused by: java.lang.NullPointerException at org.apache.hadoop.hdfs.MiniDFSCluster.startDataNodes(MiniDFSCluster.java:422) at org.apache.hadoop.hdfs.MiniDFSCluster.<init>(MiniDFSCluster.java:280) at org.apache.accumulo.test.AccumuloDFSBase.<clinit>(AccumuloDFSBase.java:66) ... 21 more {noformat} bq. Where should this be documented? User guide, readme, etc? Maybe add something to the users guide and add an example that shows off what can be done.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-708
17715	ACCUMULO-708	Keith, are you getting other errors about directory permissions? see: http://search-hadoop.com/m/5Te0lu8g0c1/hbase+windows/v=plain	1	1	https://issues.apache.org/jira/browse/ACCUMULO-708
17716	ACCUMULO-708	Still do not have the unit test running. It may be a configuration issue on my workstation, but its not the umask issue, still investigating. A few more comments on the code. * In AccumuloVFSClassLoader and AccumuloClassLoader the methods replaceEnvVars(), addUrl(), findAccumuloURLs(), etc. look very similar. Are these methods just copies? If not, what is the essence of the diffs? * Seems like unit test AccumuloContextClassLoaderTest would benefit from using two seprate jars. The same jar is loaded into two different context. Seems like it would be better to load two different jars with different classes. Then verify that each context contains only the expected classes and nothing else. * AccumuloReloadingVFSClassLoaderTest would also benefit from another jar. Test are needed for a new class coming into existence, a new version of an existing class coming into existence, and an existing class going out of existence. Moving forward on this we need to start thinking about having a table prop for configuring per table classloaders. If you would like help I can work on that after we get this checked in, just let me know. I was thinking of a scenario where we have the following two classloader contexts : * system class loader context : contains accumulo server and core jars and all deps in HDFS * table foo class loader context : contains user iterator jars in HDFS It seems like the two context above are siblings. Is this correct? Therefore the foo class loader will not have accumulo-core jars in itself or its parent class loaders. Will this cause problems when loading an iterator from the foo classloader?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-708
17717	ACCUMULO-708	bq. I did run into the same not-helpful Exception Keith posted above and traced it back to the same issue Dave linked to. After I realized AccumuloDFSBase.java:25 was sending the logging to /dev/null I think my umask is correct {noformat} $ umask 0022 {noformat} AccumuloDFSBase.java line 25 is an import statement. Did you mean line 40 or line 49?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-708
17718	ACCUMULO-708	bq. AccumuloDFSBase.java line 25 is an import statement. Did you mean line 40 or line 49? Uhh, my code still says line 25. The actual code I commented out was the following: {noformat} //Turn off the Jetty and MiniDFSCluster logging static { System.setProperty("org.apache.commons.logging.Log", "org.apache.commons.logging.impl.NoOpLog"); } {noformat} If your umask is 022, then you need to change the code from {noformat} conf.set("dfs.datanode.data.dir.perm", "775"); {noformat} to {noformat} conf.set("dfs.datanode.data.dir.perm", "755"); {noformat}	1	1	https://issues.apache.org/jira/browse/ACCUMULO-708
17719	ACCUMULO-708	Josh, Please back out your change of setting dfs.datanode.data.dir.perm to 755. I believe this issue is fixed in HDFS-1560. Instead, please change the hadoop-test dependency in start/pom.xml to 1.1.0. I talked with Eric about changing the hadoop dependency from 0.20.205 to 1.1.0 for Accumulo 1.5. I talked with Keith yesterday and I believe he is past the directory permission issue, he is now running into another issue that has to do with the configuration of his computer. Keith, bq. •In AccumuloVFSClassLoader and AccumuloClassLoader the methods replaceEnvVars(), addUrl(), findAccumuloURLs(), etc. look very similar. Are these methods just copies? If not, what is the essence of the diffs? If I remember correctly, they are copies of methods in AccumuloClassLoader. I did not want to extend AccumuloClassLoader as I do not know its lifetime. bq. •Seems like unit test AccumuloContextClassLoaderTest would benefit from using two seprate jars. The same jar is loaded into two different context. Seems like it would be better to load two different jars with different classes. Then verify that each context contains only the expected classes and nothing else. I was testing that the same jar/class was in fact being loaded by two different classloaders, and were therefore different classes. I will add your test suggestions to my to-do list. All, I believe that the discussion around which contexts are supported is a separate discussion. I can think of several different scenarios in which contexts could be defined: per user, per table, per scan session, per minc/majc session, per application, etc. Regarding the heirarchy of the context classloader, I can see Keiths point above, and would also counter with a different scenario. Say for example that I wanted to run different versions (api compatible of course) of the Accumulo iterators on my table. The current setup would allow me to run a 1.5.0 tablet server and 1.5.1 iterators on my table. I can do this because the context classloader for my application is not a child of the system classloader. Changing the context classloader to be a child of the system classloader is a very small change.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-708
17720	ACCUMULO-708	does it make sense to move the two open subtasks for this feature to the next release (not 1.5.0) and close this issue. The feature is in the 1.5.0 codebase. The two open tickets are not critical to 1.5.0.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-708
17721	ACCUMULO-706	This example sets the maxLatency to 2 minutes, but the code committed against this ticket sets the maxLatency to long.MAX_VALUE. I think we should have a default maxLatency of closer to 1 second or 1 minute. Otherwise people are going to have writers that sit around in long running processes and have data in their un-flushed buffers forever (I've seen this a couple of times), which is a source of confusion. Is there a counter-argument for making the default MAX_VALUE? Is there a performance problem with keeping it in the 1-100 second range?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-706

#	Requirement	Questions	Answered	Successfully Answered	URL
17722	ACCUMULO-706	bq. Is there a counter-argument for making the default MAX_VALUE? Is there a performance problem with keeping it in the 1-100 second range? No, not that I can think of. Not sure why I did that. Maybe to make it consistent with setTimeout(). I think 1 second would be too low, 1 or 2 minutes would be probably be an ok default. Seems like one second would cause small batches to be sent, which would be slower. I suppose if writing small batches were slower, then larger batches would build up. But it may oscillate. Seems like that could possibly cause unnecessary thrashing. Anyway, I think 2 minutes would be good. There was not a default previously, the user always had to specify something. If changed, would also need to update javadocs	1	0	https://issues.apache.org/jira/browse/ACCUMULO-706
17723	ACCUMULO-704	I think I may be missing something here... but I'll ask: Why does the build.sh script call pdflatex on the Accumulo user manual 4 times? http://svn.apache.org/viewvc/accumulo/trunk/docs/src/user_manual/build.sh?view=markup	0	0	https://issues.apache.org/jira/browse/ACCUMULO-704
17724	ACCUMULO-704	For review to see what people think: I moved the building of the user-manual from normal execution and placed it in its own profile that can be activated. I also updated the README. Thoughts? Does someone have recommendations on a more correct/better way to do this?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-704
17725	ACCUMULO-704	Why can't the user-manual's build.sh file be run manually? Does it need to be invoked by maven?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-704
17726	ACCUMULO-703	Could you add some info to help about this?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-703
17727	ACCUMULO-703	can you update docs/examples/README.bloom to use the new command... the example currently uses PrintInfo... should something be added to the user manual?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-703
17728	ACCUMULO-700	If we configure iterators using, say, comma-separated base64-encoded representations of IteratorSettings, a potential disadvantage is that the iterator information will no longer be readable in the job configuration. Does anyone need this to remain readable?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-700
17729	ACCUMULO-700	Will there be a tool that can convert the representations into human-readable form?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-700
17730	ACCUMULO-697	Does this work with client side iterators only? The top level iterator will usually be running server side, so you'll need to have an interface to set a serializer for some object at the top of the stack (and possibly another deserializer if you have custom iterators beneath it) and set a deserializer at the client level. At some point on the server side, the iterator will have to transform the user type into a {{byte[]}}, which is basically what a {{Value}} is. On the client side, the user will still have to supply code to deserialize the {{byte[]}}, which can already be accomplished with no code changes by using a library such as Google Collections/Guava or Apache Commons.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-697
17731	ACCUMULO-697	I like the concept, but does this go far enough? If Values aren't special, then are Keys special, and if so then why? Should we make our SortedKeyValueIterator implement Iterable<? extends Object> ? Then the bottom level iterator (RFile reader) would include KeyValue or Entry<Key,Value> objects, the top level iterator for scans would have to have objects that are serializable, and the top level iterator for compactions would have to implement Iterable<Entry<Key,Value>>. One of the problems we have with iterators now is that the Key and Value are accessed with separate methods, even though they're always read off of disk together. Splitting up the Key and Value on the server side is sort of arbitrary and could reduce our ability to parallelize iterators (if we ever decide that's something we want to do). Another problem is that SortedKeyValueIterator falls somewhere in between Java's Iterator and Iterable interfaces. SortedKeyValueIterator holds onto filters, aggregation parameters, etc. that make it act like a collection, and it keeps a pointer to somewhere in that collection like an Iterator. I think we should change SortedKeyValueIterator into more like an immutable collection, or a consistent, isolated, unchanging view of the data, and have it implement Iterable. That might open up opportunities for automating optimization of queries on the server side, or better support for built-in iterator tree definition languages.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-697
17732	ACCUMULO-697	I don't know why this is something we want to integrate into our API. A utility can easily be written to do whatever transformations you want on top of the scanner's iterator, so why push this down into our api? I think a change like this could only serve to make the api harder to use for little to no real gain.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-697
17733	ACCUMULO-697	What is K and V? Where are they defined? I know they mean key and value but I'd like to grok the fundamentals. Sorry for this basic question, and pardon me for asking it here, but I don't know what kind of web search would give me an answer.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-697
17734	ACCUMULO-697	bq. What is K and V? Where are they defined? I know they mean key and value but I'd like to grok the fundamentals. Sorry for this basic question, and pardon me for asking it here, but I don't know what kind of web search would give me an answer. http://en.wikipedia.org/wiki/Generics_in_Java	1	1	https://issues.apache.org/jira/browse/ACCUMULO-697
17735	ACCUMULO-693	[~medined], which version did you see this problem with? Can you provide more information on your environment?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-693
17736	ACCUMULO-677	Why should they depend on a different ACL? Grant/Revoke was intended to be an "ALTER USER" ACL, whereas Create User was intended to be a "CREATE USER" ACL, and this would *include* creating the initial authorizations. When you view separate it as "CREATE" and "ALTER" on the object "USER", it makes complete sense in an object oriented way. Separating them makes less sense, because it treats "CREATE USER" and "ALTER USER" as two completely independent actions, completely ignoring the common object you are manipulating ("USER"). If you implemented the above, then to create a fully functioning user, you'd have to have two separate permissions. I understand the desire to change the API to match this paradigm, if you were to desire to switch to it, but I personally think that leaving the "CREATE USER" and "ALTER USER" paradigm in place is better. That said... without deprecating or changing the "CREATE"/"ALTER" paradigm, you could add to the API a method to create a user without authorizations (unless that already exists).	0	0	https://issues.apache.org/jira/browse/ACCUMULO-677
17737	ACCUMULO-671	Is this easier now that we have a root table?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-671
17738	ACCUMULO-670	Can you clarify how you think this code should behave?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-670
17739	ACCUMULO-670	[~kturner] - I believe I addressed this. Can you confirm before I close this ticket again?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-670
17740	ACCUMULO-652	This is still open. What are your plans for merging/closing this for 1.7.0?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-652
17741	ACCUMULO-650	So far I have added a desc command to the shell to display the descriptions, added a flag to tables to display the tables and the descriptions, added a flag to createtable to set the description. the desc command will either display the description for the table or it will update it using a flag. EX: {noformat} user@instance table> desc table [description of table] user@instance table> desc -u 'new description' table [new description] {noformat} Should I add the ability to set the description when importing a table or a directory? Also, should I clone the description of the table when the table is cloned?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-650
17742	ACCUMULO-650	Does a cloned table have any provenance? Maybe a cloned table should have "Cloned from XXXX at YYYY-MM-DD HH:MM:SS" appended to the end of the description? I haven't thought about this deeply. Is there any UUID associated with a table? On the other hand, since cloned tables are mutable, does it matter?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-650

#	Requirement	Questions	Answered	Successfully Answered	URL
17743	ACCUMULO-650	Since we're thinking. I've used clone in the following manner. I import a lot of stuff into one table. Then clone it so that other people can work with that data. Then I continue to work with the original table. My changes don't affect the other people. Dumb question time ... can clones be used like git for data? Can a clone be thought of as a tag or branch?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-650
17744	ACCUMULO-650	Kevin, can you add some unit tests?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-650
17745	ACCUMULO-650	I think the per table config route would be best. Ultimately its still sored in zookeeper, just in a more systematic way. This would involve adding an enum to o.a.a.core.conf.Property could still have API methods in table operation to set and get desc. These would be similar to methods for manipulating locality groups and iterator settings, which are also per table configs. Also, if you are still thinking of adding something to create table, I still think we should add a NewTableConfig method. Would still have an option on tables command to list descriptions. Would we still need the desc command? I do not really like the name, but I am uncertain about the functionality. As far as functionality, it may make things slightly simpler for the user rather than using the config command. Also having a specific shell command for setting it puts a layer of indirection between the implementation and the user.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-650
17746	ACCUMULO-650	Do we want to include this specific specialized per-table property in addition to the user-defined properties added in ACCUMULO-2841? I think 2841 pretty much satisfies all the use-cases. Any objections to closing?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-650
17747	ACCUMULO-638	Can this ticket be pushed to v1.6?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-638
17748	ACCUMULO-638	Is it OK if I assign this to myself? Looks like there hasn't been much activity since it was created. I'd be very grateful for an extra pair of eyes on [my work|https://github.com/rweeks/accumulo/tree/ACCUMULO-638], if anybody has some spare cycles. I guess it's complicated by the fact that most of the code changes will be in the Titan codebase, but there are a [few iterators|https://github.com/rweeks/accumulo/blob/ACCUMULO-638/core/src/main/java/org/apache/accumulo/core/iterators/user/SeekingFilter.java] that I think would be generally useful in Accumulo.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-638
17749	ACCUMULO-638	All yours Russ! Would you like me to set a target version? Or should we just go for whatever it lands on?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-638
17750	ACCUMULO-638	I'll try to make some time to give your changes a look. Would comments on Github be best?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-638

17752	ACCUMULO-626	Github user keith-turner commented on the pull request: https://github.com/apache/accumulo/pull/50#issuecomment-155167375 For iterators that can be run at major compaction, how can we exercise delete keys?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-626
17753	ACCUMULO-626	Github user joshelser commented on the pull request: https://github.com/apache/accumulo/pull/50#issuecomment-155168971 > For iterators that can be run at major compaction, how can we exercise delete keys? Very good question! The completely mocked-out IteratorEnvironment is a sign that I haven't thought past the scan case. I'm not even sure if the ColumnFiltering iterator with SortedMapIterator is even a 100% valid in-memory reproduction of how it works in a TabletServer. I had left input entirely up to the user, so I'm not sure of a simple way to test deletions without potentially messing up some expected table structure. There are some tricky edge cases at compaction that I haven't yet considered how to encapsulate. Combiners on non-full compactions are another good example.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-626
17754	ACCUMULO-626	Github user joshelser commented on the pull request: https://github.com/apache/accumulo/pull/50#issuecomment-163673419 Drat, another thing I just thought of: this is meant to be user facing, and I think it should eventually hit public API. It might be premature to put it there immediately (since this hasn't been vetted by anyone but myself), but does anyone have thoughts on a path to "graduate" into public API status?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-626

That makes more sense. Some users may define iterators that expect a column family, whereas all the tests seek with `Collections.<ByteSequence> emptySet(), false`. There may be many other places where a user does something "non-normal" intentionally. If we make this public API, we should state that user iterators do not necessarily need to pass all the IteratorTestCases, or at least that failing an IteratorTestCase does not imply a bug.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-626
17757	ACCUMULO-626	Github user keith-turner commented on the pull request: https://github.com/apache/accumulo/pull/50#issuecomment-163715371 > but does anyone have thoughts on a path to "graduate" into public API status? Well currently iterators are not declared as public API.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-626
17758	ACCUMULO-625	There has not, and it is not slated for 1.5. Do you have thoughts on what you would like to see?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-625
17759	ACCUMULO-625	Currently there's a UniqueColumn map/reduce example (org.apache.accumulo.examples.simple.mapreduce.UniqueColumns). Ideally I would like to take that example and turn it into an iterator. Due to the tear up and tear down factor, is it safe to assume i can only perform this operation per row bases? So the iterator would find all the distinct column in a single row and the client would have to perform a final distinct for all the rows?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-625
17760	ACCUMULO-622	How do we determine where to make changes? When will we know all changes are complete?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-622
17761	ACCUMULO-618	Does this matter? We also now have "instamo", an unbranded module like cloudtrace. Should we also brand that artifact as "accumulo-instamo" and cloudtrace as "accumulo-trace"? All these are pretty trivial changes, but I can think of at least one benefit: searching in Maven repositories indicates that the artifacts are associated with the Accumulo software stack (vs. simply being produced by the Accumulo group, which is indicated by the groupId).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-618
17762	ACCUMULO-618	bq. Should we also brand that artifact as "accumulo-instamo" and cloudtrace as "accumulo-trace"? I think accumulo-trace is good. bq. searching in Maven repositories indicates that the artifacts are associated with the Accumulo software stack Hopefully instamo does not end up any maven repos. Its just meant to serve as an example accumulo maven project.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-618
17763	ACCUMULO-617	That should be the default behavior? Is this not the case and/or did it change in 1.5?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-617

#	Requirement	Questions	Answered	Successfully Answered	URL
17764	ACCUMULO-617	Will ACCUMULO-1479 satisfy this ticket? Can I close this as a duplicate?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-617
17765	ACCUMULO-600	Agree that its complex. Have you considered moving it out of the build entirely so that you don't have to keep it up to date. By moving it out (to GitHub as an example) it could be maintained on its own schedule.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-600
17766	ACCUMULO-600	Does anyone know if moving WikiSearch to Github would preclude us from including it as part of future releases? I know there's ASF policy saying that code for ASF projects must be kept in ASF's SVN repository -- does that extend to contrib parts of a release?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-600
17767	ACCUMULO-600	Hi Adam, and Keith: any reason to move it to Github if it's currently within the ASF Accumulo project? I guess I'm not seeing the logic about removing it in general? Won't that splinter the development?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-600
17768	ACCUMULO-600	Hi Josh: {quote} I think the biggest issue has been that most of us who have been a part of the wikisearch development are not currently Accumulo developers (in other words, without svn commit access). {quote} Sorry to hear that -- how much contribution would you say you've been doing? {quote} Correct me if I'm wrong, anyone, but I believe Github was suggested as an alternative to the ASF SVN if it was decided that those who will be maintaing the wikisearch example will stay disjoint from those who are Accumulo committers. {quote} Do you have any context on this? Like an email thread on list where this was discussed?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-600
17769	ACCUMULO-600	{quote} Sorry to hear that – how much contribution would you say you've been doing? {quote} The few patches I've made have been coordinated with Eric Newton. Some on jira, some off. {quote} Do you have any context on this? Like an email thread on list where this was discussed? {quote} No, most of this was discussed offline. I'd encourage those who fall into this category to chime back in with their opinion rather than me asserting an opinion for them. :)	1	0	https://issues.apache.org/jira/browse/ACCUMULO-600
17770	ACCUMULO-600	Billie, since you did the work to pull out of trunk and into contrib, can we close this? We can make new ticket(s) to address the TODOs you left.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-600
17771	ACCUMULO-588	David, the descriptions look good. Did you miss mapred? Also, I have a script that copies these READMEs into the Accumulo site and treats them as markdown (see http://accumulo.apache.org/1.4/examples/). I was able to modify this script to place the links to the individual examples next to your descriptions, so it will look good when we publish the 1.5 example.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-588
17772	ACCUMULO-588	Thanks for the fix-up. I'm fairly sure I did the mapred writeup. However, it probably disappeared when I reformatted. http://accumulo.apache.org/1.4/examples/ does not show the brief blurbs about each example. Would it be OK to add a .md extension to the READMEs file to indicate that markdown syntax can be used? Your script might need updating. Would that change affect anything else?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-588
17773	ACCUMULO-587	I finally got a chance to look into this. I don't think anything special needs to be done for {{MultiTableBatchWriterImpl}} other than adding the {{finalize()}}. The object that actually needs to be closed (the {{TabletServerBatchWriter}}) is private and not shared. The {{BatchWriter}} implementation returned by the {{getBatchWriter(String table)}} method is a non-static inner class and therefore all references to any {{BatchWriter}} created by the {{MultiTableBatchWriterImpl}} must be lost before {{finalize()}} could be called. The only wrinkle with {{MultiTableBatchWriterImpl}} is the {{close()}} method may throw a {{MutationsRejectedException}}, so that must be handled in the {{finalize()}} method. I'm not sure if you'd want to turn that into a logged 'non-exception' or a {{RuntimeException}}; I could see the argument for either way (although I'd lean toward the {{RuntimeException}}). Regardless of the choice for handling the {{MutationsRejectedException}}, the memory/thread leak would be avoided because {{TabletServerBatchWriter}}'s {{close()}} method closes the thread pool in a finally block even if it throws the {{MutationsRejectedException}}. So I think just adding a method like this to {{MultiTableBatchWriterImpl}} provides the needed check: {code} @Override protected void finalize() { if (!closed) { log.warn(MultiTableBatchWriterImpl.class.getSimpleName() + " not shutdown; did you forget to call close()?"); try { close(); } catch (MutationsRejectedException mre) { log.error(MultiTableBatchWriterImpl.class.getSimpleName() + " internal error.", mre); // ... AND/OR ... throw new RuntimeException("Exception when closing " + MultiTableBatchWriterImpl.class.getSimpleName(), mre); } } } {code}	1	0	https://issues.apache.org/jira/browse/ACCUMULO-587
17774	ACCUMULO-581	It looks like the following commands are covered at least in some fashion: * authenticate * config * createtable * createuser * debug * delete * deleteiter * deletetable * dropuser * flush * getauths * grant * help * insert * passwd * revoke * scan * setauths * setiter * table * tablepermissions * tables * user * userpermissions * users * whoami Which leaves these: * -?- * -about- * -addauths- * -addsplits- * -bye- * -classpath- * -clear- * -clonetable- * -cls- * -compact- * -constraint- * -deletemany- * -deleterows- * -deletescaniter- * -deleteshellter- * -deleteuser- * -droptable- * -du- * -egrep- * -execfile- * -exit- * -exporttable- * -formatter- * -getgroups- * -getsplits- * -grep- * -help- * -history- * -importdirectory- * -importtable- * -info- * -interpreter- * -listcompactions- * -listiter- * -listscans- * -listshelliter- * -maxrow- * -merge- * -notable- * -offline- * -online- * -ping- * -quit- * -renametable- * -setgroups- * -setscaniter- * -setshelliter- * -sleep- * -systempermissions- * -trace-	1	1	https://issues.apache.org/jira/browse/ACCUMULO-581
17775	ACCUMULO-580	Is the suggestion to add a new method to the BatchScanner interface to set the batch size?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-580
17776	ACCUMULO-569	Does an accumulo shell exposed through the monitor (ACCUMULO-196) accomplish this?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-569
17777	ACCUMULO-564	What is the status of hadoop 0.23 relative to hadoop 1.1 and hadoop 2? It seems like it's the worst of both worlds: alphaness of 2 without the HA stuff that's in the beta (1.1). Perhaps it's reasonable to say no hadoop 0.23 support?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-564
17778	ACCUMULO-550	I noticed yesterday when working on ACCUMULO-652 that the index entries at level 1 and higher are still interspersed between level 0 blocks with the current technique. Is there value in keeping indexes at a given level greater than 0 close to each other, or is that overkill?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-550
17779	ACCUMULO-532	Can this be closed or resolved?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-532
17780	ACCUMULO-532	I'm looking at this a bit closer, and was going to update this contrib to use Hama 0.6.0 release (latest release as of this writing) in the process of implementing ACCUMULO-769. However, I noticed a problem. Is there a reason BSPJob does not extend Job, and BSPJobContext does not extend JobContext? It seems it would be very convenient if it did.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-532
17781	ACCUMULO-527	The indentation of a few statements in shell.setInstance is incorrect, making it hard to read. Should the code error if multiple options are given? For example if -z, -zi, and -zh are given. I suppose the existing code did not error if -z and --fake were specified. I tried running the new unit test w/ eclemma and it showed no coverage in Shell... I wonder if this is because powermock.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-527
17782	ACCUMULO-527	[~bhavanki] I just pushed your commits and a commit of mine where I changed the unit test. Can you take a look at that change? Thats the first time I have used PowerMock, its interesting, seems to tightly couple the test to the implementation rather than the expected behavior. Does anyone have any issue w/ adding the dependencies? I reasoned that since they were scoped at the test level there was no need to seek consensus.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-527

#	Requirement	Questions	Answered	Successfully Answered	URL
17783	ACCUMULO-527	[~bhavanki], is this issue resolved?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-527
17784	ACCUMULO-527	It is. Keith had added some updates on top of mine and they are fine with me. I'm satisfied. [~kturner], are you good with it?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-527
17785	ACCUMULO-511	Before this was added listscans already suffered from the issue of too many columns. I am thinking we need to do something to help users select columns. I suppose user cans pipe the output to awk or cut. Maybe thats good enough? Are there other options to consider beside the following? * add options to list scans for selecting columns to print * do nothing and let users use awk or cut	0	0	https://issues.apache.org/jira/browse/ACCUMULO-511
17786	ACCUMULO-511	I see the words "too many columns" above, and I can't but think that perhaps we should just treat data from listscans as though it were results from a table scan. We already know how to deal with formatting output, filtering columns, etc. from any other real table. The problem is that the "listscans" isn't a real table... but it would be trivial to treat it as one, and get all the features that come with tables as a result. Why shouldn't we be able to get a virtual table view of metadata like this?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-511
17787	ACCUMULO-508	Doesn't the AccumuloInputFormat already do this? I'm pretty sure there's an autoAdjust feature that merges overlapping ranges, splits ranges on tablet boundaries, and then assigns them. This is done by default. If this feature is turned off, the ranges are given to mappers exactly as they were given to the job: 1 range per mapper.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-508
17788	ACCUMULO-507	Good point. Do you think we should make this change in 1.4 branch?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-507
17789	ACCUMULO-507	See ACCUMULO-826. Rolled back changes that created a file 1.4 : r1400976 1.5. : r1401004. What should we do for 1.5?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-507
17790	ACCUMULO-507	I'm tempted not to fix this since it seems impossible to satisfy both our requirements: not leaving large files around and not killing the job when the process exits. Is it too onerous to adjust the mapred.user.jobconf.limit property to allow for jobs with large numbers of ranges?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-507
17791	ACCUMULO-507	Can you clear the ranges from the conf after the splits are generated? Not sure how it's done now, but individual tasks should be able to reconstruct what they need from the split metadata, and then there's no reason to pass around all the ranges to each mapper.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-507
17792	ACCUMULO-507	I think this fix was reverted for the wrong reason. ACCUMULO-826 found that a MapReduce job would fail if the process that started the job was killed. This was an issue because we were writing the user's password to a file that was being deleted on exit. Whenever a new map task is kicked off it needs to read the password, so it was trying to read a nonexistent file. But the ranges don't need to be read by each map task, they only need to be accessed once when getSplits is called, which happens before the job is actually submitted. Thus it shouldn't matter if the file containing the ranges is deleted in the middle of a job -- if the process exits before the job is actually submitted, the job will fail, but that seems OK to me. The other issue pointed out in ACCUMULO-826 is valid, that the file was being written to the file system, added to the distributed cache, then read directly from the file system. The ranges file shouldn't have been added to the distributed cache at all, since it's not needed by the slave nodes. However, there may be little point in re-applying this fix if the mapred.user.jobconf.limit applies to the whole job submit directory. Using the ranges file method might effectively halve the size of the job submit directory, but you could still hit the limit if you had enough ranges. I guess I'll try to verify this is true. Does anyone have opinions about this issue?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-507
17793	ACCUMULO-507	bq. Does anyone have opinions about this issue? I do not have a problem with reverting the revert if the job keeps running. What about random files being left around? Was the file place somewhere that M/R will eventually clean up if the process that created it does not?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-507
17794	ACCUMULO-507	Happily, I have verified that my initial impression was incorrect: the size limit is on the job configuration file only. bq. What about random files being left around? It looks like the files are created in the user's home directory. I'm not sure how FileSystem.deleteOnExit works, but since the ACCUMULO-826 bug was about the files being deleted too soon, I'm inclined to think it's effective. This is what the javadocs say: "Mark a path to be deleted when FileSystem is closed. When the JVM shuts down, all FileSystem objects will be closed automatically. Then, the marked path will be deleted as a result of closing the FileSystem." I'll look at recreating a patch. For 1.5.0?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-507
17795	ACCUMULO-507	deleteOnExit works if the process is killed w/ SIGTERM. It will not work if the nodes dies or the process is killed w/ SIGKILL. A job submit directory was mentioned, I was wondering if the file would be placed there and if it would be periodically cleaned up by the job tracker. But the file was placed in user home dir, so that would be left in case of unclean shutdown. Could the file be placed somewhere that the jobtracker does cleanup?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-507
17796	ACCUMULO-507	I was wondering about that. The job submit directory is an example of such a temporary directory, but that wouldn't be created until after the user has called setRanges and submitted the job. Maybe I should revisit deleting the ranges from the job configuration when getSplits is called, after the ranges are read. Is there ever a case where a job would be submitted more than once? If so, this change would cause a failure on the second submit.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-507
17797	ACCUMULO-504	I am looking for offending log messages. I ran the following and did not see anything obvious. {noformat} grep "log\." ./src/server/src/main/java/org/apache/accumulo/server/master/Master.java | grep "erver" {noformat} I saw the following, but these log messages are already commented out. {noformat} // log.info("Current servers " + currentTServers.keySet()); // log.info("Current servers " + currentTServers.keySet()); {noformat} Other code besides Master.java could log. Does anyone know of log messages that log all of the servers?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-504
17798	ACCUMULO-502	David: did Keith's response answer your question, is the accompanying Javadoc addition sufficient, and can this ticket be closed?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-502
17799	ACCUMULO-498	Note that it is possible to have a Key with a visibility that is not a valid ColumnVisibility (see ACCUMULO-193). How should we handle calls to getColumnVisibilityParsed() in this case? Just let it throw the error? I don't think we should parse the CV unless someone asks for it, but I guess we could store it once someone asks for it, and drop what is stored if the CV changes.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-498
17800	ACCUMULO-498	Stumbled across this ticket and saw it's been sitting with a patch. Does anyone have anything else to weigh in for/against it or any possible adjustments which need to be made for it?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-498

#	Requirement	Questions	Answered	Successfully Answered	URL
17801	ACCUMULO-490	I have been thinking about this very problem for quite some time. What is the suggested approach, Thrift? I have some JRuby classes that wrap an earlier version of Accumulo's Java API and had hoped to find time to port that to the latest version. It would then be fairly easy to add a Rails app on top of that and provide a RESTful interface. The Rails app could easily run on the JVM via JRuby. I envisioned an API like this: GET table/colf/colq PUT table/colf/colq with the data being the value for a new record POST table/colf/colq with data being the value to update a record GET table/colf?startcolq=abc&endcolq=def DELETE table/colf/colq We could return xml, json, or whatever by adding a .json or .xml to the request. Handling authentication might take some work. Need to provide a way to give the user column visibilities. I have some generic ideas there as well. I haven't worked out in my mind yet how to handle paging. Expanding that, we could then provide client libraries in different languages, like the MongoDB drivers. If we provided a Javascript one, we would need to support JSONP, Dojo's window.name transport or some other hack to get around Javascript's SOP restriction so you could POST, PUT and GET from a different host. I have no idea how this approach would compare to a Thrift service. Whatever the design, I would love to help work on this.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-490
17802	ACCUMULO-490	Hey David, Interesting class. What exactly is it doing besides opening a socket? I would have expected to see it look at the incoming request and then either retrieve data or store data. Maybe I didn't understand the intent of your ticket. I can certainly appreciate simplicity. What I have in mind is more like http://wiki.apache.org/hadoop/Hbase/HbaseRest. It will take some effort to make it useful and performant. Looks this is still a ways off if ACCUMULO-482 needs to be fixed first. I'll start a separate project on github with my ideas and post a link when I have something useful. Thanks	0	0	https://issues.apache.org/jira/browse/ACCUMULO-490
17803	ACCUMULO-490	Does the proxy provided in ACCUMULO-482 satisfy your needs for this?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-490
17804	ACCUMULO-483	Does this boil down to a "randomize the location of all tablets in a range" operation? How would you test the effectiveness of this action?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-483
17805	ACCUMULO-482	It was a little hard to understand the problem the way you stated it, but I think I understand. You mean any part of the keyvalue pair might be sensitive and need to be protected and the !METADATA table might expose some of those. So you're saying if a proxy is created you don't want !METADATA entries to be sent to it, because the way most instances of Accumulo are deployed involves the Accumulo client being run on a protected machine, i.e. a machine on the security perimeter that the user can't just examine the memory of. But I don't think METADATA entries need to be exposed outside the trusted accumulo client in order for a proxy to work ... one could simply ferry scan parameters and the resulting keyvalue pairs to and from the client (for queries). The proxy could also be configured to simply disallow reading directly from the !METADATA table. Would that still leave the possibility of sensitive elements of KeyValue pairs being leaked?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-482
17806	ACCUMULO-482	Have there been any updates on this (Sapan/Jim)? Talking to devs from other start-ups makes me think this feature is more important than I originally thought. Not having a thrift proxy API or a built-in REST API is a real barrier to non-java/non-JVM devs using/adopting Accumulo. This barrier is not there for Cassandra and HBase since they both have Thrift APIs. I think many devs in our community discount this since Java is so dominant, but outside the government, esp. in smaller start-ups there is a real aversion to Java, instead favoring python, Ruby, Node JS, etc.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-482
17807	ACCUMULO-482	As I have been researching ways to make Accumulo accessible to other languages, I ran across JCC[1] used by PyLucene[2] and I thought it was interesting. Anyone have experience with this? Would it be an option for exposing Accumulo API to Python? [1] : http://lucene.apache.org/pylucene/jcc/index.html [2] : http://lucene.apache.org/pylucene/	1	1	https://issues.apache.org/jira/browse/ACCUMULO-482
17808	ACCUMULO-482	I think the continued use of PKeyValue obfuscates what is going on here: {noformat} struct PMutation { 1:binary row 2:list<PKeyValue> cells; 3:list<PKeyValue> deletedCells; } {noformat} Seems that I would expect {noformat} struct PMutation { 1: binary row 2: map<PColumnUpdate, binary> cells; 3: set<PColumnUpdate> deleteCels; } {noformat} Why would a PColumnUpdate would be confusing to create directly? It would be confusing to me to get a runtime error because I specified the row as something different in the PKeyValue.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-482
17809	ACCUMULO-482	bq. On the one hand, introducing a PColumnUpdate object violates 1.3 If the set of data objects is too small, it will make the API harder to use. How does introducing PColumnUpdate make it harder to use? Can you give an example?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-482
17810	ACCUMULO-482	bq. Make it maintainable I am thinking the maintenance headaches in the future will come from the many table, instance, and security operation methods exposed via the thrift API and less so from the the read and write methods. But maybe not. Does the thrift API only provide a way to create a batch scanner? No way to create a regular scanner?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-482
17811	ACCUMULO-482	bq. Does the thrift API only provide a way to create a batch scanner? No way to create a regular scanner? There's currently only a way to create a batch scanner. bq. I am thinking the maintenance headaches in the future will come from the many table, instance, and security operation methods exposed via the thrift API ... I can easily remove methods from the API if we think they are not needed for this interface. Let's discuss if any of the ones I implemented won't be needed on a regular basis.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-482
17812	ACCUMULO-482	More considerations * How do we let users specify that they want to let system set timestamp? * make it easy to write what you scan... writing PKey supports this * make it easy to make column updates to a row atomic... writing list<PKeyValue> really works against this * how easy is it to write code against the API and how does code that uses the API look ... I think this is really important... being forced to repeat the same row for a mutation works against this Thinking about this, we could really minimize structure overlap by making PKeyValue that was composed of PKey, Value. And then PKey composed of a row and PColumn. I am thinking that trying to minimize the structs like this makes it more cumbersome to write the code. {noformat} updates = [new PColumnValue(new PColumn("cf","cq1","cv",7),"val1"), new PColumnValue(new PColumn("cf","cq2","cv",7),"val2")] deletes = [new PColumn("cf","cq3","cv",8)] Mutation m = new Mutation("row", updates, deletes); {noformat} If we had PColumnValue that was flat, I think the following code is easier to write than the code above. But this makes it more cumbersome to write code that scans data and writes it to another table. {noformat} updates = [new PColumnValue("cf","cq1","cv",7,"val1"), new PColumnValue("cf","cq2","cv",7,"val2")] deletes = [new PColumn("cf","cq3","cv",8)] Mutation m = new Mutation("row", updates, deletes); {noformat} I do not think there will be any confusion when a user looks at these flat data structs. I suppose I think users will start with the functions and not the data structs. At least thats what I would do. For example I would look at the write method and see that it takes a mutation, then I would look at mutation to see what it needs.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-482
17813	ACCUMULO-482	bq. How do we let users specify that they want to let system set timestamp? I just modified PKey to make timestamp an optional value. If it is unset then the system will set the timestamp. I believe this is the best way to specify this so we don't have any "magic timestamp values" (0, -1, etc) that users may actually want to use for some reason.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-482

#	Requirement	Questions	Answered	Successfully Answered	URL
17814	ACCUMULO-482	bq. I just modified PKey to make timestamp an optional value Interesting, not a thrift feature I am familiar with. In a few of the popular languages, is the generated code for dealing with an optional field easy to write? Does this complicate reading data in anyway? When reading data, we would always expect the timestamp to be set, so it would be odd to have to constantly check if its set when reading.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-482
17815	ACCUMULO-482	bq. In a few of the popular languages, is the generated code for dealing with an optional field easy to write? Not exactly sure about all languages. In Java optional fields aren't in the constructor and need to be set via a method call. bq. Does this complicate reading data in anyway? When reading data, we would always expect the timestamp to be set, so it would be odd to have to constantly check if its set when reading. Well, I copy whatever is in the key coming out of accumulo into the response value. That value cannot be null since it is a primitive. So on a scan the timestamp will always be set. (This happens in Util.toThrift(Key)). In Java the timestamp is still a primitive so it won't throw an execption if you try to get an unset timestamp value, i suspect it will be 0 since it is appears to be an uninitialized long primitive. I think if you try to access an unset optional non-primitive, it will return null. There are also isSet* methods generated for optional values that tell you if the value is unset (as opposed to set to null).	0	0	https://issues.apache.org/jira/browse/ACCUMULO-482
17816	ACCUMULO-482	Is there anything else that we're still expecting to see accomplished for the 1.5.0 release in regards to the thrift proxy? It looks ready to go from where I'm standing!	0	0	https://issues.apache.org/jira/browse/ACCUMULO-482
17817	ACCUMULO-482	I looked at the proxy/README today and some things were unclear to me. When I compile Accumulo from the top level, isn't the proxy submodule included? Why would it need to be built separately? In order to build the proxy module from within the proxy directory, I needed to run 'mvn install' at the top level because of a dependency. The proxy.properties file which needs to be edited is not the one in the build directory, it's the one in the installation directory. Also, the 'accumulo proxy' command should be run from the installation directory. I also got a chance to look at the proxy/python/README file. Perhaps it's just that I know very little about python but "PYTHONPATH=path/to/generated/api:path/to/thrift/libs python TestClient.py" does not look right. Should there be a ';' before the python command? Will python people know what the 'path/to/generated/api' and 'path/to/thrift/libs' are?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-482
17818	ACCUMULO-477	What does deprecated since 1.4.1 imply? Does that mean we would remove the methods in 1.5? Also, the javadocs are incorrect. Syntax for methods is Classname#methodName (or just #methodName if it's the current class), and there's a link to a method that doesn't exist (setOptions presumably should be addOptions).	1	0	https://issues.apache.org/jira/browse/ACCUMULO-477
17819	ACCUMULO-473	Keith, when are you proposing doing the binary search? On the block after the block has been read into memory or before? I would advocate keeping block sizes small enough to be read into memory and if a binary search is done, do it on the block in memory. This is in order to restrict lookups and scans to one disk seek.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-473
17820	ACCUMULO-473	I experimented with dynamically indexing cached rfile blocks and the results were promising. For my experiments I created a Rfile with 100K entries and a 50 byte value. I ran the attached Test.java program. This program seeks every key in the file backwards, forwards, and randomly. The rfile block size was 100k and the file had 69 blocks, so each block had around 1.4K entries. ||Test||Lookup Rate w/o transient index||Lookup Rate w/ transient index|| |Backwards| 8.5K lookup/sec | 86K lookup/sec | |Random | 8.5K lookup/sec | 75K lookup/sec | |Forwards | 452K lookup/sec | 500K lookup/sec | For the backwards test I took the last three numbers, the first two were slower as a result of the JIT not kicking in. For these test there was a 9x to 10x speedup. For each block of 1.4K keys an index of 31 keys was eventually created, then it stopped indexing (I added some prints to the code to get this info). The code does not create indexes where the keys in the block are closer than 32 keys. These test show that seeking forwards is really fast, the code was already optimized for this. So if an iterator can seek forwards it should, but this change will help with seeking anywhere. I am not sure why seeking forwards is so much faster. My current theory is that alot more object creation is done when seeking backwards or randomly. I have not confirmed this. Even when I adjust dynamic index code to create larger indexes, its still does not approach the forward seek speed.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-473
17821	ACCUMULO-466	Could also make the Accumulo file output format do something similar. It would throw an error if you try to write a really large key. If the user really wants to do this, they can configure the output format to accept larger keys. Should this be a 1.5 fix?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-466
17822	ACCUMULO-461	The ConstraintLoader and ConstraintChecker are in the server module. Do we think they should be moved to the client module? It doesn't seem like a good idea to make a separate loader and checker for the client.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-461
17823	ACCUMULO-458	Probably the test.Test interface should be commented as well. How does the TestTemplate file get turned into the ClassLoaderTestA/Test.jar (and the other two jar files)?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-458
17824	ACCUMULO-457	Benson, would you like to remove that src directory, or would you prefer for me to give it a try? Should this patch be applied before removing src, or would you make a different patch once it's gone?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-457
17825	ACCUMULO-456	Does it make sense to build on top of an existing utility like Sqoop? I don't know how Sqoop could be expanded to consider split points and iterators. Maybe there is something else?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-456
17826	ACCUMULO-455	Does tool.sh only work when the class you're running is a Tool?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-455
17827	ACCUMULO-452	I had another thought on this: locality groups are good for features that are in a relatively constant, low cardinality set with a fairly dense distribution across the primary partitioning dimension. Also, queries must be aligned with the locality group frequently enough to amortize the cost of that partitioning. This means that the current column family-based locality groups only really help when cells in sorted order frequently oscillate between locality groups. I want to say that this type of feature tends to be something that is explicitly modeled based on how the user wants to query their data. If the user decides to put this information in the row or the column qualifier, could they just as easily put it into the column family? By the way, expressions like John mentions in ACCUMULO-164 help to groups high cardinality features into a low cardinality set of groups, so I think we're on the same page there. Partitioning based on the timestamp is an interesting consideration. In this case, you would want a small number of ranges of timestamps to be "active" (not aged off yet) at any one time. Timestamps are a bit special, though, because they tend to be inserted in increasing order. Instead of using the locality group mechanism, we might achieve better performance by modifying the major compaction selection algorithm to avoid merging files that have very different timestamp ranges. Keeping track of timestamps on a per-file or per-block basis would support bulk filtering, and would be as (or more) efficient than locality groups. Might this be another approach to consider? Like Aaron, I think we need some more details on envisioned scenarios in which more generic locality groups would be useful before we jump too deeply into implementing them.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-452

#	Requirement	Questions	Answered	Successfully Answered	URL
17828	ACCUMULO-452	I am thinking that keeping a min/max time stamp per file may satisfy some use cases but not all. It would certainly be helpful. The compaction algorithm may need to be modified as Adam suggested to make it more effective. The way major compaction currently works in Accumulo older data will eventually end up in the largest file. If your goal is to avoid this file under certain circumstances, then the user has no explicit control over that. Also if you want to age off older data, you will probably still need to read this entire file to do that. If they want to scan the last 6 months of data for example and the largest file overlaps this time range but only 10% of the data in the file matches the range, then a lot of data needs to be filtered. Does HBase do anything special to deal with case. Why limit locality groups to only column families? * Increases model complexity. I think this is true. I think the complexity of the locality group model is not increased. If you understand partitioning on column families, you will easily understand the concept of partitioning on any part of the key. It certainly does increase the complexity of the big table model as a whole though. It would certainly give users more rope to hang themselves. Personally I am not opposed to this. * Increases code complexity. I do not think this is true. This would actually simplify the code and make this functionality much easier to test in isolation. I have found this with iterators, they dramatically decreased the complexity of the scan code. When iterators were first introduced, the scan loop was starting to get fairly complex. This seems a lot cleaner than customizing the current code to meet needs. OF course, end users may not care about the complexity of the accumulo source code. They just want it to solve their problems. * There are no compeling use cases. These must exist. I think the original time based locality group is one, is their a better simpler way to achieve this? That would remove this use case. The HBase design is simpler in terms of the model, but the code sounds more complex. Also this model does not give the user explicit control w/o allowing them to configure the compaction process in some complex way.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-452
17829	ACCUMULO-452	Even if users use the server-provided timestamps or their own, the timestamp still falls after the row and column, and is used the same way: to limit values after the rows and columns have been identified. To me it seems as if this happened, as a little play: BigTable Guys: look you can physically partition your data automatically using the rows! Users: Great! That works, but maybe I want an additional, secondary partitioning? BG: hmm. ok, how about you can also partition on the column family? It's the next item in the hierarchy, doesn't add too much complexity, pretty straightforward. Just specify them into groups called locality groups and I think we can keep this under control. Users: Yay! You guys rock! BG: You're welcome. Other users: Hey, locality groups are cool, but can I partition on column qualifiers? BG: why are rows and column families insufficient? OU: well, I don't know, I just really like to slice things every way possible. BG: sigh .. Yet other users: Wait, what about timestamps? You know what's more general than partitioning on a few elements of the data model? Partitioning on ALL the elements of the data model! So sweet. More general means more better! BG: I'm quitting to go work at Facebook.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-452
17830	ACCUMULO-452	Users do want this capability. They keep asking for it. We do turn around them and tell them to sort their data differently. They don't always like that answer. The intent of this is to meet a user need. Storing temporal information in the column family is a possibility. It would work well for some cases, like having two locality groups one thats the current month and another thats everything else. You put the month in the column family and reconfigure the locality groups every month. However, if you would like something like LG1 = < day old, LG2 = < month old, LG3 = < year old this would not be possible w/ the current locality group implementation. However ACCUMULO-164 may make this possible. Store time to the day in the column family. John pointed out one problem w/ this, its hard to automatically determine that patterns match disjoint sets. I need to think through ACCUMULO-164 some more and see what the possible gotchas are. If you have to duplicate the data in the timestamp into your column family to accomplish your goals, does this indicate a problem with the model? It do not think its clean, but its ok w/ me.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-452
17831	ACCUMULO-448	Is the concept of 'diameters' explained somewhere? I think this is the first time I have heard the term in relation to Accumulo.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-448
17832	ACCUMULO-443	Does this mean that we should take the targetJDK=1.6 from the pmd configuration?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-443
17833	ACCUMULO-443	I don't think so. What is the harm in leaving it there?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-443
17834	ACCUMULO-442	The comments look great. They lead me to my next question. The script does not delete old generated Java files. I don't know much about Thift. Could it be possible for the templates to have changed so that some generated Java files are no longer needed? How would they be managed?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-442
17835	ACCUMULO-442	Is there any reason why this script should not delete the contents of the src/trace/src/main/java/cloudtrace/thrift directory for each run of the script? Is anything in that directory other than thrift-generated files?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-442
17836	ACCUMULO-441	I am down to one last javadoc warning which says: {{noformat}} [WARNING] javadoc: warning - Multiple sources of package comments found for package "org.apache.commons.collections" {{noformat}} Any idea how to resolve this message? Also, I have only changed javadocs comments. The code compiles and the tests run with no errors. Is there anything stopping me from committing to the trunk tomorrow night? 42 files were changed.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-441
17837	ACCUMULO-429	Perhaps check the user you're running as (like not root) Do we want to do PID level process checking? In addition to existence of certain directories, we also want to check writability.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-429
17838	ACCUMULO-429	Is there some standard to judge when to use /usr/bin or /usr/local/bin or even /usr/local/accumulo as a symlink to /usr/local/accumulo-1.4?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-429
17839	ACCUMULO-429	I cleaned up the symlink checking for ACCUMULO-1071 and added a couple new features. The patch also checks dependencies in a consistent way. Has anyone used (or a fan/hater) of monit (http://mmonit.com/monit/)? I could put together a set of monit configurations for the accumulo processes.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-429
17840	ACCUMULO-429	+! for monit. The more utlities we can preconfigure the better. Would you put the scripts in the contribs directory or somewhere else?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-429
17841	ACCUMULO-421	Is this something that can be easily simulated with [HDFS Attributes|http://blog.cloudera.com/blog/2014/06/why-extended-attributes-are-coming-to-hdfs/]?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-421

#	Requirement	Questions	Answered	Successfully Answered	URL
17842	ACCUMULO-420	This feature needs to work correctly in the case of concurrent compaction request. If two user request compaction of a table at around the same time and one passes iterators and one does not, then iterators should be applied to all relevant tablets for the user that passed iterators. Also, tablet servers can decide to compact all files in a tablet at any time. This another form of concurrency that must be considered. The current design is that there is a compaction counter in zookeeper. A compaction operation will increment this. As each tablet is compacted it records what the compaction counter was when it started. Compaction operations wait for the compaction counters for each relevant tablet in the metadata table to reach at least its count. The following is a possible new design. compact FATE op # set compaction iterators in zookeeper # increment compaction counter in zookeeper # wait until all tablets in compaction range have at least this operations compaction counter # remove compaction iterators in zookeeper TServer compact all operation # get compaction iterators from zookeeper # get compaction counter in zookeeper # compact with current compaction iterators # write compaction counter to metadata table Considerations * setting compaction iterators in zookeeper must accomodate concurrent request * the iterators are intentionally read from zookeeper before the counter. The iterators are written before the counter. Does zookeeper guarantee that iterators written before the counter will always be seen? If not there is a race condition. * If two users submit compaction request with iterators, this design could run compactions with both users iterators settings. Does anyone see an issue w/ this? * Iterators from one user compaction request could be applied to multiple compactions of a single tablet.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-420
17843	ACCUMULO-418	Would you like to see this in 1.4.x? If so, then we could possibly create a reader that uses the current file format and reads the index at the end of the file. For 1.5 we can change the file format to avoid reading the index.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-418
17844	ACCUMULO-418	I took a look at how sequence file and sequence file input format handles this. It writes a 128 bit sync marker between records in the file. The sync marker is unique per file. It reads the beginning of the file to read the sync marker and other info. Then for the HDFS block you are interested in it start scanning looking for the 128 bit sync marker. Once it finds that it keeps reading records until it passes the block boundary. So sequence file does some non local reads for the beginning fo the file. In 1.4 w/ the multilevel rfile index, reading the index may involve more than reading the end of the file. If the index is more than one level, then the nodes of the tree are sprinkled throughout the file.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-418
17845	ACCUMULO-415	Currently scan iterators are stored as per table config as shown below. {noformat} root@test14 ctt_001> config -t ctt_001 -f iterator.scan ---------+---------- SCOPE | NAME | VALUE ---------+---------- table | table.iterator.scan.vers ..... | 20,org.apache.accumulo.core.iterators.user.VersioningIterator table | table.iterator.scan.vers.opt.maxVersions .. | 1 ---------+---------- {noformat} One way to support iterator profiles is to use a different prefix in the per table config. For example table.iterator.profile.<prof name>.scan.<iter name>. The Scanner could have a method added to it that allows a user to select a profile to use. This is backwards compatible because it just adds a method to the scanner. Table operations API would need to be adjusted to support profiles, hopefully we can do this in a backwards compat way too.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-415
17846	ACCUMULO-415	Could this be accomplished entirely in client code, if iterator settings were serializable to a client config?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-415
17847	ACCUMULO-411	Once we are finished imporving the javadocs for 1.4 we need to put them on the web site. Seems like I remember reading about a way to put a tarball of javadocs in Aapache CMS when we were first setting up the web site, but I do not remember where.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-411
17848	ACCUMULO-407	Does this property file change need to be done on all nodes in the cluster? Do you think it would be hard to have log4j read from an hdfs file? Also note that Accumulo might be running in an environment in which the files are all 'locked down' (i.e. unchangeable). In the past, I have written a small web interface to change the log levels. The web application writes the log4j property file.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-407
17849	ACCUMULO-407	All nodes already need to have a valid local Accumulo installation (which includes the conf directory), so no, I don't see a point to having it read from HDFS currently. There could be some benefit from exposing something in the monitor. I'd like to see this rolled into the upcoming 1.4.0 release, so I didn't want to make a big change. I would assume that you have some sort of tool to copy a new log4j file out already installed on a cluster (e.g. pscp, pdcp). Same goes for making a read-only conf directory writable to do the copy. All that being said, I don't think anyone would object to you writing something to procedurally alter the log level either. Please have at it.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-407
17850	ACCUMULO-407	Would it make sense to set the default log level for org.apache.accumulo to INFO in generic_logger.xml and monitor_logger.xml as well? I suspect there's no need to generate these logs by default any longer if DEBUG level can be turned on dynamically.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-407
17851	ACCUMULO-407	Found some issues- + String propertyLogConfig = String.format("%s/conf/log4j.properties", System.getenv("ACCUMULO_HOME"), application); + if (new File(logConfig).exists()) { + PropertyConfigurator.configureAndWatch(propertyLogConfig, 5000); line 1 should not have the application argument line 2 should be new File propertyLogConfig To put aside these minor foibles, there are a few questions we need to ask ourselves in this implementation. 1. Do we want to be watching both the *_logger.xml AND the log4j.properties? 2. Do we want to provide a mechanism to pick up the introduction of an application specific logger.xml file after start up? 3. Do we want to continue to have, by default, 2 different logs for each application, or can we just have 1? As for me, 1. Not if we don't have to. I believe the log4j.properties is only used as a default until we start watching the *_logger.xml. 2. Not for 1.4, but definitely in the future. 3. Unsure, but not for 1.4	1	1	https://issues.apache.org/jira/browse/ACCUMULO-407
17852	ACCUMULO-407	{quote} 1. Do we want to be watching both the *_logger.xml AND the log4j.properties? {quote} Yes, because log4j.properties provides a mechanism for influencing the logging configuration for all applications regardless of whether they have a specific *_logger.xml or not. {quote} 2. Do we want to provide a mechanism to pick up the introduction of an application specific logger.xml file after start up? {quote} Would this involve picking up the new application specific configuration file and disabling the watch on the generic configuration file? This would involve implementing a custom config file watcher because log4j doesn't seem to have hooks to cancel a watch initiated by configureAndWatch. An alternative would be to watch both a generic and application specific logger, but I suspect that could quickly get confusing. {quote} 3 . Do we want to continue to have, by default, 2 different logs for each application, or can we just have 1? {quote} How about this: by default the A2 (debug) appender is commented out and default log level is set to INFO. This would produce 1 log per application. If someone wants to re-enable DEBUG logging they can uncomment the appender and set the levels to DEBUG to get the current behavior with 2 files per application OR they do whatever they they want.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-407
17853	ACCUMULO-403	It seems like the decisionIterator shouldn't be restricted to the same column families that are returned by the RowFilter. Is the suggested usage that the subclass reseek in the acceptRow method if it wants different columns?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-403

#	Requirement	Questions	Answered	Successfully Answered	URL
17854	ACCUMULO-397	I have not looked at any accumulo code .. and I apologize for making this suggestion blind ... but should static methods be avoided so make testing easier?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-397
17855	ACCUMULO-391	The patch is looking pretty good. An additional thing you'll need to do is update the fetchColumns method so that you're fetching columns for particular tables. Also, how would you feel about getting rid of TableKey and leaving this as an InputFormat<Key,Value>? I suggest this because the RangeInputSplit already contains the table name, and a Mapper can access it through ((RangeInputSplit) context.getInputSplit()).getTableName(). It's somewhat awkward, but the advantage of keeping InputFormat<Key,Value> is that you can have Mappers that don't care which table they're running over and can be used with either the single table or multi-table input format. If we want to make it easier to grab the table name, we could add a public static method that pulls it from a Context, or from an InputSplit. A separate thing I want to do is get rid of the AccumuloIterator and AccumuloIteratorOption configuration objects and just make IteratorSetting Writable so it can be used directly. I'll open another ticket about that, though.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-391
17856	ACCUMULO-391	I've addressed all the issues on this thread- is everyone okay with me merging this in?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-391
17857	ACCUMULO-391	Also it looks like TypedValueCombiner, TTimeoutTransport, and core/src/test/resources/log4j.properties shouldn't be included in the patch. Which IDE are you using? Something appears to be adding a space between a method name and the parenthesis, e.g. "getInstance (" which doesn't match our code style. Also, it may be your IDE that has changed the AccumuloInputFormatTest to import InputFormatBase.addIterator and other static methods instead of just InputFormatBase, changing calls to this method from AccumuloInputFormat.addIterator to just addIterator. I found this to be confusing.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-391
17858	ACCUMULO-391	bq. What happens if I configure iterators for a table that I did not set as an input? I was trying to stay away from enforcing the order in which the user calls the static configuration methods but maybe this is unavoidable. I could always throw an exception in the initialize() method but that would be too late.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-391
17859	ACCUMULO-391	What do you think about taking the union of all the tables configured as input tablets, or with ranges, iterators, or fetched columns?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-391
17860	ACCUMULO-391	bq. What do you think about taking the union of all the tables configured as input tablets, or with ranges, iterators, or fetched columns? I think this may be easier to use but more error prone. There are more places where you can mistype a table name. A fluent class for configuring tables to read would be another alternative. The class could serialize itself to job or a static method could take job and varargs of these table config classes. This completely eliminates the problem from the API, the API does not allow setting configuration for a table you are not reading and the table name is only specified once (in the constructor of the config object).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-391
17861	ACCUMULO-391	bq. There's nothing tying us to the current method of configuring jrrbs What are "jrrbs"? bq. I wouldn't worry about having things configured for tables that aren't going to be scanned. I can't see a bug happening from it that wouldn't be caught with minimal exercise/testing. I am pretty sure people will end up spending lots of time trying to figure out why their scan time iterators are not being executed because they mistyped a table name. I agree that they will most likely hit this while testing, but its still wasting a developers time.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-391
17862	ACCUMULO-391	[~sonixbp] I do not want to impede progress, this will be a very nice feature to have for 1.6.0. I would like to see the API improved and I can spend time on that. How can we move forward? One possible way we could proceed is that you iron out all of the issues identified except for configuring tables not read, and I can pick up from there. I can work in the branch you created (you could rebase it first if you wanted a more concise commit history).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-391
17863	ACCUMULO-391	Looks good to me. Nitpicking: can you run the formatter over TableQueryConfig and InputConfigurator before pulling into master? It looked like those were still a little goofy. A broader general question: InputFormatBase (mapred and mapreduce) both have a protected static method getTabletLocator method that is tagged with a {{@since 1.5.0}} whose signature was changed with these changes. Do we just update the javadoc from since 1.5.0 to 1.6.0 because it wasn't a part of the "public API"? Do we have any general practice for javadoc tags on internal API changes?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-391
17864	ACCUMULO-391	That's a great question Josh. Originally, I changed the @since tags to 1.6.0 but since I only changed a few lines in the method, I couldn't justify the change to the javadoc. It would be nice if we could define a general practice for this. On another note- are we planning on deprecating the existing legacy methods for adding input to a single table? I'll add those in before I merge as well but I wanted to make sure that's what everyone wanted.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-391
17865	ACCUMULO-391	[~kturner], [~bills], and any other interested parties, there didn't seem to be a final consensus on whether or not the current single-table API methods should be deprecated in favor of a new multi-table configuration input method. Can I merge over what I have without deprecating the methods for now? If everyone in this thread is comfortable with the API changes, should we just deprecate them?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-391
17866	ACCUMULO-391	[~sonixbp], can you clean up the warnings in trunk? I know you're not finished, but it's driving me a little crazy.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-391
17867	ACCUMULO-390	Would it make sense to create a deb package specifically for a standalone vm (like ubuntu on virtualbox)? This deb file could have the tiny configuration set up automatically.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-390
17868	ACCUMULO-390	Is that supposed to say 512MBB?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-390
17869	ACCUMULO-378	This sounds really cool. I looked at the HBase doc, it seems like it replays the walogs on the slave cluster through the client API. Where you thinking of doing this for all tables, or just select tables? What are your thoughts on replicating user and table metadata in zookeeper? What are your thoughts on enabling replication for existing data? (we clould clone the table, copy its existing data, and replicate new walogs created after the clone operation). How are you thinking of handling bulk imported data? (could possible copy to slave and bulk import on their also, this could be a FATE operation initiated by the bulk import FATE operation). What are your thoughts on replicating split and merge operations on the master cluster? I am wondering how much we can leverage FATE to make this easier and more reliable.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-378
17870	ACCUMULO-378	I need a bit of clarification- are you adapting the WAL to log to HDFS via appends or are you working on a mechanism to shove the logs into HDFS once they are complete?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-378
17871	ACCUMULO-378	I would like to collaborate w/ you on this. It seems like a starting point might be a design doc. Would you mind putting together a design doc detailing your thoughts on this? Any other suggestions on how we could collaborate? We could also meet at the meetup (http://www.meetup.com/Accumulo-Users-DC/events/45491582/) if you are in this area.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-378

#	Requirement	Questions	Answered	Successfully Answered	URL
17872	ACCUMULO-378	[~kturner], [~sapanbshah42], did you guys ever come up with any sort of design document? Looking back at the last chatter, we were still in a localfs WAL capability which is a bit out of date considering current Accumulo support :) Given [~rmutyala]'s question on dev@a.a.o about this, any interest in thinking about this as a major 1.7 feature? It will give something to think about while testing 1.6.0 :)	1	1	https://issues.apache.org/jira/browse/ACCUMULO-378
17873	ACCUMULO-376	- turns debug logging on or off listscans - list what scans are currently running in accumulo. 17874	ACCUMULO-361	Corey, would that effectively be a short cut to "clone and export" on a list of tables?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-361
17875	ACCUMULO-359	How would one track the cluster size, memory availability, machine power, and other tasks running during the testing? It seems like any given job has a lot of factors that affect performance.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-359
17876	ACCUMULO-359	Can we defer this to an external tool, like YCSB?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-359
17877	ACCUMULO-351	Are the options for compression codecs pluggable? Seems like it would be nice to just have a compressor/decompressor interface and tell people that they can just throw implementations in lib/ext. Does Accumulo do much with the compressors other than toss them over to HDFS for getting codecs?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-351
17878	ACCUMULO-351	bq. Are the options for compression codecs pluggable? Not really w/ Accumulo's copy of BCFile. See org.apache.accumulo.core.file.rfile.bcfile.Compression.Algorithm. Would be nice to change this or see if a newer version of BCFile has.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-351
17879	ACCUMULO-348	Could we batch the splits to tablet servers instead of sending them individually?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-348
17880	ACCUMULO-343	In for a penny ... I've run through all of the examples and the user manual but I managed to misunderstand what was happening with the setauths command and visibility labels. Can examples using no visibility labels (i.e., no -l option on the insert) be added to README.visibility for completeness? If there are no visibility labels is that equivalent to "public" so that anyone can see it? Please add something like "Accumulo does not keep sort of list of visibilities. Furthermore there is no definition of visibilities, so there is no such thing as defined and undefined visibilities. This might lead to an issue with misspelled visibility labels. Keep this in mind when debugging a misbehaving application." somewhere in the README.visibility file. Can you add a few scan examples to the "Inserting data with visibilities" section? For example, {noformat} # Clear authorizations test> setauths -c test> scan # no records are displayed because no authorizations are set and all records in the test table have visibility labels. test> scan -s broccoli 21 21:56:40,121 [shell.Shell] ERROR: java.lang.RuntimeException: org.apache.accumulo.core.client.AccumuloSecurityException: Error BAD_AUTHORIZATIONS - The user does not have the specified authorizations assigned test> setauths -s apple test> scan # no records are displayed because the one record in the table needs both "apple" and "carrot" authorizations due to the visibility label. test> setauths -s apple,carrot test> scan florida george:age [(apple&carrot)|broccoli|spinach] 50 test> setauths -s broccoli test> scan florida george:age [(apple&carrot)|broccoli|spinach] 50 test> setauths -s apple,carrot,broccoli # If you have several authorizations, you can use the scan command to display only specific authorizations. test> scan -s broccoli florida george:age [(apple&carrot)|broccoli|spinach] 50 # Of course, the visibility logic is still applied, therefore you must specify both apple and carrot test> scan -s apple,carrot florida george:age [(apple&carrot)|broccoli|spinach] 50 {noformat} Is there any way to set the VisibilityConstraint as a default constraint for all tables?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-343
17881	ACCUMULO-339	Looks good. Thanks for the ticket and the patch. Sapan, I've added you to our contributors list in JIRA. David, I'm adding you as well due to your sheer volume of reported issues. This will allow you to have more control over tickets.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-339

#	Requirement	Questions	Answered	Successfully Answered	URL
17882	ACCUMULO-303	I was initially poking around with the idea of being able to set multiple different formatters on a table, but eventually backed it out for the simplicity of a single formatter per table. I also have some concern regarding formatter "logic" being in the createtable, formatter, and config commands. I'd be interested in any feedback as to what you think a good strategy is moving forward. Does the formatter command still need to exist if all it's really doing is acting as a wrapper around a config call? Is it beneficial to preserve some backwards compatibility of the formatter command? Does anyone actually use the formatter command now?? :) I can look into adding a functional test as well.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-303
17883	ACCUMULO-303	If you are up to it, could you create a MockShell that would accept lines of input and provide lines of output to test this? It would make testing the shell a unit test, which would be much faster/frequent.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-303
17884	ACCUMULO-303	Yes, you would get a ClassNotFoundException if you tried to set a formatter that doesn't exist on the Accumulo classpath. Additionally, if there was one previously set on the table, you would, I think, see the same ClassNotFoundException when you try to switch to that table in the shell. This could very easily happen if someone upgrades Accumulo and forgets to copy the jars from the old Accumulo installation's lib/. Is there a desired benefit to falling back onto the DefaultFormatter if the specified formatter cannot be loaded (ClassNotFoundException, ClassCastException, etc)? Having a missing formatter class set *will* mess up all the scans until removed or the classpath being fixed; however, (Batch)Scanners won't be affected.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-303
17885	ACCUMULO-303	Sorry for the delay on this. Please poke around on this and let me know if I missed anything we discussed above. Things covered in ACCUMULO-303-bugfixes-with-mock-shell.patch: * Added argument to formatter option in CreateTableCommand * Removed any caching of formatter inside of Shell (will always check ZK) * Will fall back to DefaultFormatter if the configured Formatter cannot be loaded * Added option to ScanCommand to allows users to provide a formatter of their choice to scan with * Reworked Shell, created MockShell, and created FormatterCommandTest which uses MockShell	0	0	https://issues.apache.org/jira/browse/ACCUMULO-303
17886	ACCUMULO-291	I do not understand this ticket. Is this related to calling the init() method on an iterator, or something else?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-291
17887	ACCUMULO-290	Does the proxy provide essentially the same functionality requested by this ticket?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-290
17888	ACCUMULO-274	True. Is the main() method needed in FileDataIngest? If it stays, to me, that means that separate documentation is needed to show people how to use it.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-274
17889	ACCUMULO-274	I know that I am a nudge but could someone put this example in context. Why would someone *want* to store file data into Accumulo instead of directly into HDFS? Or into a super file?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-274
17890	ACCUMULO-263	What would we be checking here? The existence of the table?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-263
17891	ACCUMULO-261	Setting the number of entries can also be very useful. You can already set the batch size in bytes on a per-table basis through the table.scan.max.memory parameter. Do we need to be able to set it per scan?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-261
17892	ACCUMULO-259	Thought I made a ticket for this, but closest I can find is the comment in ACCUMULO-238 . This is step one. Step two is to do as you described- seperate the 'authority provider' from the 'authenticator'. This way we can let users authenticate against one system that may or may not be able of holding credentials. So, as you said, they could authenticate against one system and then use zookeeper for their various credentials. This still leaves us with the issue of coming up with a versatile interfaces that provides enough information for most providers. Also, should this be a seperate ticket, or just one large operation? And I agree on the errors.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-259
17893	ACCUMULO-259	What would be the reason for two tickets? Are you thinking of making some initial changes in 1.4 and doing more in 1.5?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-259
17894	ACCUMULO-259	Well, that's the question. How much do we want to do and when? 1.4 is nearing release and I worry that this change is too big, but I have a feeling that we want to get this pluggable interface in place (primarily due to the release of hadoop 1.0 which has kerberos support). Unless you have an objection, I'm proposing doing the full split (authenticator, authority provider, and proper utilization of these interfaces) for 1.4 so we have them available ASAP.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-259
17895	ACCUMULO-259	The functional tests are failing with: {noformat} java.lang.NullPointerException at org.apache.accumulo.core.client.ZooKeeperInstance.getSecurityTokenClass(ZooKeeperInstance.java:326) at org.apache.accumulo.core.util.shell.Shell.updateUser(Shell.java:937) at org.apache.accumulo.core.util.shell.Shell.config(Shell.java:279) at org.apache.accumulo.core.util.shell.Shell.main(Shell.java:374) at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method) at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:39) at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:25) at java.lang.reflect.Method.invoke(Method.java:597) at org.apache.accumulo.start.Main$1.run(Main.java:97) at java.lang.Thread.run(Thread.java:662) {noformat}	1	0	https://issues.apache.org/jira/browse/ACCUMULO-259
17896	ACCUMULO-259	SunnyDay ran fine, and I did a test and had the exact same tests failing in the branch and in the trunk the other day. Which tests are failing for you?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-259
17897	ACCUMULO-247	How do you install pdflatex on Ubuntu 11.10?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-247
17898	ACCUMULO-247	How do you install pdflatex on Ubuntu 11.10?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-247
17899	ACCUMULO-244	Eric, I think you had mentioned possibly using iptables to accomplish this. Is that still what you are thinking?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-244
17900	ACCUMULO-244	This ticket is over a year old. Is this still a concern?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-244
17901	ACCUMULO-241	We have a few goals for the language used in security labels (expressions made up of operators and authorizations): they should be easy to read by human and by computer, and they should be unambiguous, the Boolean logic operators should be easily distinguished from the atomic authorizations, labels should be backwards compatible forever, and the language should be extensible to anything we might want to do with it in the future. To support backwards compatibility while leaving room for extension, we originally reserved all non-alphanumeric characters and only allowed alphanumeric characters within authorizations. When our users asked for '_', '-', and ':' for use in authorizations, we added those to the white list. Moving to a black list approach is a bit more limiting to extensibility, but I think it can be done while preserving the possibility of adding future capabilities. Supporting escaping of reserved characters might be another option, but that might reduce the human readability. The big question is what do we want to do with cell-level security in the future? I think we probably want to support "not" at some point, so probably '!' and '~' should be reserved. If we do want to support escaping, we should probably reserve '\' or '#' and ';'. It has been hinted that we might want to support something like regular expressions, so '*', '?', '[', ']', '+', ... How about variable substitution, with '%' or '$'? Maybe it would be better to keep a white list for now?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-241

#	Requirement	Questions	Answered	Successfully Answered	URL
17902	ACCUMULO-241	Doh! For some reason I kept not seeing the word 'visibility'. Now I understand what labels are being discussed. Would it make sense to use syntax like NOT(FOO) instead of !FOO in labels. Using function-based syntax (if that terminology makes sense) reduces the need for fiddly single-character flags and should be more readable. It also leaves the door open for an extensible mechanism whereby keywords can be attached to user-supplied functionality.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-241
17903	ACCUMULO-241	I suspected the default encoding on the build server was different, but I was not sure. Does anyone know if there is a way to run something on the build server w/o committing? I will make changes to allow the encoding to be explicitly specified and see if that helps.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-241
17904	ACCUMULO-227	That makes sense - but then are you calling for an increase in the granularity of isolation (i.e. finer grained, down at the cell level) or the opposite? How does the mutation-level isolation disallow mutations with multiple identical cells? I was just looking at the isolation that Accumulo provides currently and it needs to be clearer to users. If this is largely an internal change that's fine, but if not we should make sure the isolation model makes sense for most users.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-227
17905	ACCUMULO-212	Maybe this ticket should be closed, it is not well defined. Whats actually being asked for? Is it the hooks? I do not understand why hooks would be called coprocessors? Accumulo already has some hooks/plugins (Iterators, Constraints, Balancer, Memory Manager, Authentication). If additional hooks are wanted, then why not open a ticket for each one? Maybe this ticket could be reopened in the future as a parent ticket for additional hooks. Also, the first two items mentioned in the ticket already exist.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-212
17906	ACCUMULO-199	Is this still something you want to do? I'm not sure I see the value of creating packages for a specific environment when we can create generic packages for generic environments, and provide ways to easily configure that environment. I'm not sure it makes much sense to manipulate modify our build profiles for users to rebuild. If anything, it'd be better to create an entirely separate project, which pulls in all the relevant accumulo dependencies, and repackages, with the desired configuration, if a user wished to do that.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-199
17907	ACCUMULO-196	Here are some instructions for enabling shell access in the monitor page. Generate keystore and truststore: keytool -genkey -alias <serverAlias> -keyalg RSA -keypass <keyPass> -storepass <storePass> -keystore keystore.jks keytool -export -alias <serverAlias> -storepass <storePass> -file server.cer -keystore keystore.jks keytool -import -v -trustcacerts -alias <serverAlias> -file server.cer -keystore cacerts.jks -keypass <keyPass> -storepass <storePass> Enter "yes" when prompted "Trust this certificate?" Set the following properties in accumulo-site.xml: monitor.ssl.keyStore - /path/to/keystore.jks monitor.ssl.keyStorePassword - keyPass monitor.ssl.trustStore - /path/to/cacerts.jks monitor.ssl.trustStorePassword - storePass (Re)Start the monitor and there will be a link for the shell. You can use it in mock mode, or log in as an Accumulo user.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-196
17908	ACCUMULO-164	John made the comment offline that determining if a set of patterns matches disjoint sets of column families may not be possible. I think this is may be true for regular expressions. However, it may be easy to determine this automatically with limited wildcarding. If only prefix wildcards were allowed, it seems like the following algorithm would ensure they are disjoint. {noformat} boolean isDisjoint(Set<String> prefixes){ while(prefixes.size() > 1){ String shortestPrefix = removeShortestString(prefixes); for(String prefix : prefixes){ if(prefix.startsWith(shortestPrefix)){ return false; } } } return true; } {noformat} Does this seem correct? For suffixes, startsWith() would be replaced with endsWith(). So maybe we can handle all prefix wildcards or all suffix wildcards. Can we verify anything else is disjoint? I do not think so. The following wildcards could match overlapping sets. {noformat} *a* *b* {noformat} And so could the following. {noformat} foo* *bar {noformat} So even though the literal parts of the above wildcards are unique, they can still match overlapping data.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-164
17909	ACCUMULO-164	A prefix wildcard is a simple form of a range. One other thing we may want to consider is simply having ranges. So the candidates for this ticket would be prefix wildcards, suffix wildcards, and/or ranges. These can be all be automatically verified as disjoint. Is allowing this type of setting in locality group configuration worthwhile w/o changing the scanner API? If we decided to allow prefix wildcards, then it would be easy to create a locality group with millions of actual column families. However there is no way on the client side to ask for everything in that locality group without enumerating all possible column families. It may not be possible to enumerate all possible columns families, therefore it may not be possible to read an entire locality group. To remedy this the client API and iterator API would need to be changed to allow specification of column prefixes (or ranges, or column suffixes).	1	1	https://issues.apache.org/jira/browse/ACCUMULO-164
17910	ACCUMULO-164	Well put, [~ctubbsii]. I agree with everything you say. A bit off to the side: I think one of the best lesser-realized "features" of Accumulo falls into the fact that column families are not fixed. To this extent, I think your final point about creating this functionality in an "expert" mindset further enhances the ability to support unlimited column families. The feature in its simplest sense does conflict with the original idea behind locality groups, but is that always "bad"? I'm not sure, but it's definitely different. Do you have any ideas on how to present such a feature that would avoid steering the common user toward it? Is healthy warning/documentation sufficient?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-164
17911	ACCUMULO-164	{quote} The feature in its simplest sense does conflict with the original idea behind locality groups, but is that always "bad"? I'm not sure, but it's definitely different. {quote} We've already extended the original idea behind locality groups, by allowing users to specify more than one column family for a locality group. And, I think that is definitely not "bad" ("good", even). This is just an easier way to select multiple families to put in a locality group, based on a common characteristic (like common prefix). However, I question why something like "common prefix" should be a desirable selection mechanism for multiple families in the first place. Not only are (in the case of the common prefix) these data naturally grouped locally without any use of locality groups, it's not clear to me that something like "common prefix" is the most sensible way to group related families in the general case. I'm not sure there *is* a general case, though. Perhaps len < 4 is more useful than identifying a common prefix for some users? Further, the only application for this, that I can think of, is when users introduce variability into the family that allows the number of distinct families to grow continuously (which, I think can be, and should be, done in the qualifier instead). So, I personally see little benefit to it (at least, for the common prefix case; though full regexes or suffixes would certainly have greater benefit). Maybe the most useful, and general, thing we could do to provide users the most utility to select families for a locality group, is to allow users to inject a user-defined hash function (maybe in JEXL?) to bin families into discrete localities by the arbitrary method of their choosing? {quote} Do you have any ideas on how to present such a feature that would avoid steering the common user toward it? Is healthy warning/documentation sufficient? {quote} If implemented, I think documentation should be sufficient to address all of my concerns. The main thing is just make it clear that the feature is used to *select* multiple column families, so that it's not implied that families with variability *are* the same "family". The API treats non-equal families as distinct, and that's how we should discuss them.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-164

#	Requirement	Questions	Answered	Successfully Answered	URL
17912	ACCUMULO-156	The trie used to be used for the visiblity filter parsing. We ended up switching it to a hashmap shortly before it arrived on the apache SVN, hence it's continued existence for Keith's toy project. Also, what do you mean the acceptance test?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-156
17913	ACCUMULO-143	Hi Brian, Did you have a chance to work on that? We are considering HCatalog->Hive->Accumulo and the work you are doing on Hive->Accumulo sounds very promising.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-143
17914	ACCUMULO-142	can this ticket be closed?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-142
17915	ACCUMULO-140	Would it be worthwhile adding fadvise like support to HDFS, where it can be given hints about the application plans to access a file?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-140
17916	ACCUMULO-139	Is it possible to make the compression used pluggable? I thought at one point this was the case - people could choose between LZO, Gzip, etc ..	1	0	https://issues.apache.org/jira/browse/ACCUMULO-139
17917	ACCUMULO-138	{{/do-component-build}} uses {{-Dhadoop.version=0.20.205.0}} to select a specific Hadoop version. Not only is this a very old version, it's at odds with the Bigtop "build everything together" view. Is there a way to to pull this out, to have it pick up the central bigtop-managed versions?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-138
17918	ACCUMULO-138	[~vines] I'm interested in adding accumulo to bigtop. Can I assign this jira to myself and post a patch? Is that okay with you?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-138
17919	ACCUMULO-138	In keeping with our general policy of "integrate within external projects where possible", this should be done as a part of the relevant BIGTOP ticket (BIGTOP-1175). [~gkesavan], could you please work with the assignee of that ticket to move forward? If no one objects, I plan to close this ticket as wontfix in favor of BIGTOP-1175.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-138
17920	ACCUMULO-136	Any movement on this topic? Should this ticket be resolved?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-136
17921	ACCUMULO-132	If the problem is slow tablet servers, then another way to deal with this is to detect and decommission slow tablet servers. If the problem is a slow datanode, many of the proposed solutions may still result in slow reads. In this case a solution may be to detect and decommission slow data nodes. When decommissioning datanodes and tablet servers, would need to ensure the whole cluster is not decommissioned :) Another source of slow reads I have seen is at the network level. Once I observed an entire rack running slow. After manually removing all nodes in this rack, everything sped up.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-132
17922	ACCUMULO-118	Why was this switched to a blocker? What is it blocking?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-118
17923	ACCUMULO-118	bq. It's time to start thinking about 1.6, and I intend for this to be part of that release. My goal is a working branch in 2 months. Do you plan to post a design doc outlining your approach to tackling this?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-118
17924	ACCUMULO-118	How does this related to ACCUMULO-722? Seems like if we implemented ACCUMULO-722 then we wouldn't need this, but this is a much easier ticket, right?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-118
17925	ACCUMULO-118	bq. Would avoding storing direct pointers to namenodes in the metadata table be sufficient to satisfy this? Always have a level of indirection like viewfs? Yes, a simple direct mapping is what I would like to see. Using a hash function is not simple or direct and I don't see why its needed. If I have a backup of the files from ns1 on ns2 and vice versa (think hot backup) and ns2 fails, then I can just change the mapping so that both ns1 and ns2 point to the same Hadoop HDFS instance. No update of the metadata table needed.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-118
17926	ACCUMULO-118	I was looking at some docs on viewfs. If possible, I am thinking we should not do anything that would preclude using viewfs. It seems like if URIs were supported for tablet dirs and files (along with a way to choose a tablet dir) that this would almost be enough to support viewfs. {noformat} 1;m srv:dir viewfs://clusterX/accumulo1/tables/abc 1;m file:viewfs://clusterX/accumulo1/tables/abc/F0000002.rf [] 196,1 1< srv:dir viewfs://clusterX/accumulo2/tables/abc 1< file:viewfs://clusterX/accumulo2/tables/abc/F0000003.rf [] 196,1 {noformat} If we want to further develop our own indirection layer, then maybe we should define our own URI prefix. Something like ans://. How independent should this URI be? Something like ans://<namespace name>/<path> would assume that you know where to look <namespace name> up. If the URI were like ans://<zookeepers>+<instance id>+<namespace name>/<path> then it would be more self contained. I do not think its necessary to make it self contained, its for internal use and would be translated by as needed. I was thinking about how bulk import will work in this federated world. Below is one way this could work. * Client calls import dir w/ /foo1 * Accumlo client code uses local config to convert /foo1 to URI hdfs://nn1/foo1 * hdfs://nn1/foo1 is passed to Accumulo server code via thrift * Accumulo server code looks at URI to determine where to move to, determines it has accumulo dir hdfs://nn1/accumulo. * moves files in hdfs://nn1/foo1 to hdfs://nn1/accumulo/tables/abc * Replaces hdfs://nn1/accumulo/tables/abc with ans://ns1/accumulo/tables/abc * Does bulk import of files in ans://ns1/accumulo/tables/abc Is this how this should work? The scenario above implies that Accumulo needs a dir on each namenode and way of mapping URIs to the appropriate Accumulo dir. Need to wor through this scenario w/ viewfs also.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-118
17927	ACCUMULO-118	bq. This suite of tickets is really starting to concern me. I am also concerned, I am worried about administrators having a really bad experience (bricked Accumulo instance). In hindsight I think this feature was merged in before it was complete and should not have been merged in. What can we learn from this to make development go more smoothly in the future? Personally I think if a new feature is incomplete (in terms of test, usability, documentation, etc), breaks other features of Accumulo, or introduces new problems it should not be merged in. I did not realize all of the problems absolute paths could cause until well after it was merged in. In hindsight I think the design of this feature should have started with administrative use cases. Maybe that would have brought to attention the problems w/ absolute paths much earlier. bq. I would like to start the conversation about marking this item and items around it as @Experimental I wish it were that simple. Wether you use multiple namenodes or not, Accumulo will use absolute paths in 1.6 and administrators do not have a reliable way to manage those paths. I have a fix for ACCUMULO-1832 in the works, I should be done w/ that very soon. I think that fix will address my major concern w/ this issue.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-118
17928	ACCUMULO-118	My comment about voting on design documents was a possible solution to a problem. The problem is how can we get peer reviewed designs? How can we motivate each other to spend a good chunk of time critically thinking about our designs. This issue had a design document and I remember reading and thinking "makes sense". I do not remember investing much time trying to find flaws with it, I think I just wanted to get back to whatever I was immersed in at the time. My thinking is that calling for a vote on the dev list after writing a design doc for a feature seems like a simple thing to try w/o any additional overhead because we have the dev list in place.	1	0	https://issues.apache.org/jira/browse/ACCUMULO-118
17929	ACCUMULO-115	Is this something we still want to do at all, with all of the test framework work being done?	0	0	https://issues.apache.org/jira/browse/ACCUMULO-115
17930	ACCUMULO-115	We currently use both EasyMock and PowerMock. [~jesse_yates], are you interested in rebasing your test for TabletServerBatchDeleter onto a current branch (namely 1.4.6-SNAPSHOT)?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-115
17931	ACCUMULO-87	grid_or2 is pretty good, although it might be a little hard to read. Aaron, can you make rearrange the letters into a line to see how it looks?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-87
17932	ACCUMULO-87	Aaron, Can you try creating starburst using a rounded rectangle? I would like to see how it looks w/o the corners.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-87

#	Requirement	Questions	Answered	Successfully Answered	URL
17933	ACCUMULO-87	Also - is the idea that the community votes for the best logo 'concept' which could be reworked a bit, to make it pretty, etc., or will the vote determine the golden master PNG file to be used going forward?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-87
17934	ACCUMULO-87	I committed an initial version of the logo display page to site/trunk/accumulo/misc/logo_contest_20111111.html. Can somebody make that available on the accumulo page? I'm about to hop on a plane.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-87
17935	ACCUMULO-87	Here's a site where you can look at all of the logos, sized evenly(ish), and grouped under categories that I made up: http://incubator.apache.org/accumulo/misc/logo_contest_20111111.html What do you think about this for the voting: 1. In the first voting round, everybody votes for as many groups of logos as they like, taking names from the page linked above (e.g. +1 "Greek God", +1 "Bond-O", ...). 2. We will rank the groups by popularity and take the top N for a second voting round. 3. In the second voting round, everybody votes for one group, and the top vote-getter wins. Shall we say 23:59:59 EST on Wednesday, 2011-11-16 for the first round deadline, and 23:59:59 EST on Friday, 2011-11-18 for the second round deadline?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-87
17936	ACCUMULO-84	A couple of requirement questions. 1. If the Cloudbase WAL fails to log the mutation (e.g. out of disk space), the requirement is for the WAL to continue in "READ-ONLY" mode as opposed to stopping as it does now. By continuing without WAL logging, can the Table still be recovered? 2. After the WAL enters READ-ONLY mode, is the requirement to start logging again once disk space becomes available? Or is the requirement that once the WAL enters READ-ONLY mode, it will always be in READ-ONLY mode until it is stopped and restarted? JimZ	1	0	https://issues.apache.org/jira/browse/ACCUMULO-84
17937	ACCUMULO-81	Is there an standard eclipse format for the accumulo source or for apache in general?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-81
17938	ACCUMULO-77	Can you be more specific about which errors are obscured (preferably in the form of a unit test, says ecn)?	1	0	https://issues.apache.org/jira/browse/ACCUMULO-77
17939	ACCUMULO-76	Can you clarify which tests should be converted, or close this ticket? Some tests may be able to be converted to integration tests using MiniAccumuloCluster.	0	0	https://issues.apache.org/jira/browse/ACCUMULO-76
17940	ACCUMULO-49	mlockall_agent sounds pretty cool. We have experimented w/ mlock. We wrote some JNI code, but the user had up the ulimit for it to work. One issue we ran into is that thread stacks seem to be preallocated when mlock is enabled. Without mlock, memory is only allocated on the stack as it is used. So w/ the default 1M stack, each thread would allocate 1M of mem when it was created. Used pmap to verify this. Have you had any issues w/ this?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-49
17941	ACCUMULO-49	ah - interesting. No, I haven't done any real testing of the above agent. Do you mean that, even if threads started and then stopped, the memory would be left allocated and thus "leak" over time? Or just that you have to set the limit to at least heapsize + maxThreads*1M?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-49
17942	ACCUMULO-19	Thanks Scott, I patched the 1.4 branch, and was able to build a .deb and install it on my Ubuntu laptop. I had to install Cloudera cdh3u2 to satisfy the "hadoop" dependency. Shouldn't the package depend on default-jre instead of jdk? Is this a difference between debian and ubuntu? I naively tried to run the resulting install, and as expected, it failed horribly. I created ACCUMULO-210 to build on this package for a better user install experience. If you wanted to take on this ticket, that would be great!	1	1	https://issues.apache.org/jira/browse/ACCUMULO-19
17943	ACCUMULO-19	Thanks Scott, I patched the 1.4 branch, and was able to build a .deb and install it on my Ubuntu laptop. I had to install Cloudera cdh3u2 to satisfy the "hadoop" dependency. Shouldn't the package depend on default-jre instead of jdk? Is this a difference between debian and ubuntu? I naively tried to run the resulting install, and as expected, it failed horribly. I created ACCUMULO-210 to build on this package for a better user install experience. If you wanted to take on this ticket, that would be great!	1	1	https://issues.apache.org/jira/browse/ACCUMULO-19
17944	ACCUMULO-14	Oh, I had no idea that there were functional tests. Those are definitely a solid tool. However, I still think that having a set of integration tests (before functional tests) is a reasonable goal. By developing a pipeline of tests, developers will have a shorter iteration time when building new features with more confidence that they aren't breaking anything. Side note: are we running these functional tests on the nightly build? I couldn't see where we were. This is something important that actually needs to be run as part of *a* build cycle to make sure we aren't breaking anything. Integration tests would be great for this on jenkins since we don't need to spin up hadoop or zk. On top of the utility for developers, users should still get a good way to test things, to make sure that they are writing 'good' functionality (e.g. new iterators). A more 'real' mock instance would go a long way to help that.	1	1	https://issues.apache.org/jira/browse/ACCUMULO-14
17945	ACCUMULO-14	Jesse, I took a quick look at the patch. It was hard to see what changes were made to the tablet server and master to achieve the goals of this ticket. There were formatting changes, many additions of final, additions of @Override. All of this noise makes it hard to know what changes where made to these very important classes. If you think things in the master and tablet should be marked final, I think that work should be done in a separate ticket w/ separate patches. If you are you using eclipse, are you using formatter mentioned at http://incubator.apache.org/accumulo/source.html? Would it be possible to submit a patch that did not have so many extraneous changes? Or point out what the critical change to the master and tablet server were?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-14
17946	ACCUMULO-14	I think instamo at least has to have the Apache pom as its parent to get maven repository deployment to work. Keith, is there a reason you didn't want to make the examples pom the parent of instamo (so it could inherit version numbers for its dependencies)?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-14
17947	ACCUMULO-14	bq. Keith, is there a reason you didn't want to make the examples pom the parent of instamo. Yes, I wanted to it to be a self contained example that a developer could use to quickly get up and running with Accumulo. I do not want to deploy it. An instamo jar in maven repos would have no use. I added it as a child of the examples pom just so it would automatically be pulled into eclipse, should I remove that?	1	1	https://issues.apache.org/jira/browse/ACCUMULO-14
17948	ACCUMULO-1	Commit 2c9dee325c6407b6ce7221521ba536ec0f633061 in branch refs/heads/master from [~ecn] [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=2c9dee3] ACCUMULO-1.5.1-SNAPSHOT need to store location without full path	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1
17949	ACCUMULO-1	Commit cfc0e18ec40648d3a75eca7c57058dbf0ed34811 in branch refs/heads/1.4.5-SNAPSHOT from [~ecn] [https://git-wip-us.apache.org/repos/asf?p=accumulo.git;h=cfc0e18] ACCUMULO-1.5.1-SNAPSHOT need to store location without full path	1	1	https://issues.apache.org/jira/browse/ACCUMULO-1
17950	ACE-414	The agent current doesn't keep track (in a persistent way) whether a DP is completely downloaded or not. And due to ACE-413, it simply restarted the download of a DP when the agent was restarted. With ACE-413 now fixed, it no longer does this, and simply will install the DP *once it has verified with the server that it indeed has the complete DP downloaded*. I'm a little hesitant to built in all kinds of completion checks to reduce the number of HTTP calls upon startup. I do see a functional requirement to allow offline DPs to be installed as a kind of bootstrapping mechanism for new agents, but this is also what ACE-162 is about (albeit described in a more cryptic way). IMO, implementing that issue solves this problem as well. [~wilsib], do you agree?	1	1	https://issues.apache.org/jira/browse/ACE-414

#	Requirement	Questions	Answered	Successfully Answered	URL
17951	ACE-394	Currently the Workspace implementation is located in the REST client. The WebUI client has a similar functionality. Do you want to consolidate this as well? E.g. having a project assembling the ACE JAVA Client API & implementation and the 3 projects mentioned above are the user/consumer of such a project?	1	0	https://issues.apache.org/jira/browse/ACE-394
17952	ACE-390	Can we reuse the new Maven functionality of Bnd(tools) for this?	1	0	https://issues.apache.org/jira/browse/ACE-390
17953	ACE-390	Applied the patch from [~brampouwelse] in rev#1727101. We now only create POM files for the agent, do we need to create them for other bundles as well? [~marrs] WDYT?	0	0	https://issues.apache.org/jira/browse/ACE-390
17954	ACE-388	2 cents: On 1) I think this should not be limited to downloads. Any webservice should be able to defer an agent request. On 2) What will be our default implementation (Eg. Configurable max concurrent requests)? It should indeed be pluggable; a use-case discussed is lazy deployment store calculation. In this case the logic should issue a retry-after for targets request a version list where the calculated deployment store is out of date.	1	0	https://issues.apache.org/jira/browse/ACE-388
17955	ACE-382	Under ACE-347 we have added FeedBackHandler as a control delegate and the FeedbackChannel interface (see below) This allows a custom controller to lookup and write to channels as well as deciding to send the feedback to the server. In addition I propose; * What channels are available is a configuration aspect that must match channels on the servers * What the local log maximum size is before truncating is a configuration aspect (see ACE-381) * DefaultController will simply send feedback every sync iteration for all available channels Does this cover the "control all aspects" as mentioned in the description of this issue? {code} public interface FeedbackHandler { /** Returns the feedback channels names */ List<String> getChannelNames(); /** Returns the feedback channel for a name */ FeedbackChannel getChannel(String name); } {code} {code} public interface FeedbackChannel { /** Synchronizes the feedback with the current server. Ensures the server has at least as much feedback data as we do. */ void sendFeedback() throws RetryAfterException, IOException; /** Logs a new message to the channel.*/ void write(int type, Map<String, String> properties) throws IOException; } {code}	0	0	https://issues.apache.org/jira/browse/ACE-382
17956	ACE-381	Ronald, the patch does not apply to trunk. I tried it with: patch -p1 <file Could you take a look and supply an updated patch?	0	0	https://issues.apache.org/jira/browse/ACE-381
17957	ACE-380	Configuring multiple serverURLs was implemented under ACE-379. The (default) DiscoveryHandler will use these in order and (if not disabled) check if it can connect to them before returning. Thus if 2 serverURLs are configured the first will be used as long as it is available. Once the first become unavailable it tries the second etc. Two notes: * This allows load of a large set of agents to be balanced by configuration. It is not a round-robin implementation per agent. * This only checks if a serverURL can be connected to. It does not check/interpret statuscodes (eg. the "too busy". Thus the default implementation does not cover "if the first is busy, go on to the next", a custom DiscoveryHandler could. Should we incorporate some checking/interpreting of statuscode in the check? I am not convinced. WDYT? [~marrs] [~jajans]	1	0	https://issues.apache.org/jira/browse/ACE-380
17958	ACE-377	I've updated the patch to work with r1527533 (merging StatefulTargetRepositoryTest). However, the LogIntegrationTest does not compile, because of a package constraint on org.apache.ace.log . Could you have another look at that?	0	0	https://issues.apache.org/jira/browse/ACE-377
17959	ACE-375	Following the analysis, could you please start working on the implementation? I will post the analysis soon. :)	1	1	https://issues.apache.org/jira/browse/ACE-375
17960	ACE-347	I'm currently still evaluating ACE in total and especially the MA. Our environment is very maven centric. Therefore it's not very easy to understand and handle the current project structure and the built bundle artifacts and the run configurations. Therefore I agree to your idea of redesigning the ACE MA very much. I would also prefer your project structure instead of spreading the services over multiple projects and assembling them again to a single jar. I also found your launcher implementation very interesting and inspiriting. What do you think about implementing nearly all stuff regarding the artifact management outside of the OSGi container. I mean: within or as part of this launcher?? And providing a service as mentioned by you into the OSGi container? This would have several benefits: * separating artifact management (the artifact distribution part) from the deployment / installation * allowing to even update the felix version etc. * stopping and (re)starting the framework, even with different settings/properties (e.g. in case of failures: restarting with deleted bundle cache) I (we) have several conceptual ideas how such an interface could look like. How can I provide my suggestions? Thx Wilfried	1	1	https://issues.apache.org/jira/browse/ACE-347
17961	ACE-347	Thanks for the feedback guys! [~wilsib] I can see the value of totally separating the MA from the deployment and, as you say, being able to update the container as well or even running different containers. Another approach we discussed before is to let the MA fork an entirely separate process so that, even when the deployment crashes or exits, the MA lives on and could restart. It would potentially also allow updating the MA itself without affecting the deployment... However, there are some cases where we want to punch holes in the isolation. First, the DeploymentAdmin spec itself requires us to deploy Resource Processors in the deployment and these at least require deployment admin packages. Second, strictly speaking we should raise appropriate events during deployment through eventadmin (there are some spec issues here and therefore I do not really care too much for this one). Finally, I would like it to be possible for the deployment to talk to MA services (eg. write something in a logstore or trigger/authorize an update) and I would like the MA to be extensible/customizable (preferably through services).. The again, as Marcel states, the MA should also be able to deploy as a bundle in a standard container.. are we talking about one MA that can do it all or different forms of the smae core logic? I'm not sure yet :) [~marrs] Agreed.. I can start stripping/simplifying more pending final deliberations on the discussion above. But getting down to 100k will require some drastic measures :) Wrt eliminating CM/EA note that only the interface packages are in there. Do you mean even decoupling from these interfaces?	1	1	https://issues.apache.org/jira/browse/ACE-347
17962	ACE-343	Hi Bram, I dont think it is good to specify the version in "packageinfo", because mostly it's just pick up the version you specified for the packages in the appropriate Bndtools view. Unfortunality, Bndtools automatically creates a "packageinfo" file with "version=1.0" as soon as you export the package. I faced the same problem in the past, but prefer to use "package-info.java" to add javadoc for my packages as well. Maybe we should do the same? So as I said, I would still change versions for packages inside the Bndtools view and not in the "packageinfo" file. What do you think? Yes it is a workspace patch :) And I used subclipse to checkout the projects, because it is easier to just let it also create a patch, and had never problems until now :P The fact that "svn:propset" are inlcuded is, because I had to add "generated" folders to the ignoring list. Or not?	1	1	https://issues.apache.org/jira/browse/ACE-343
17963	ACE-343	Ok got it ;) Learned something new. Didnt know that it is also working if putting it to the "packageinfo" file. But should Bndtools not responsible to synch the versions between "packageinfo" and the version you put in for the exported package in the "bnd.bnd" file?! Another question: Can we put javadoc comments on package level into that file as well? (never did it before, just used .java or .html) :) With respect to patch files, haven't thought that there is a difference between the generated files and I will keep that in mind and try to not use subclipse.	1	1	https://issues.apache.org/jira/browse/ACE-343
17964	ACE-343	BTW: Will provide another patch soon ;)	1	1	https://issues.apache.org/jira/browse/ACE-343

#	Requirement	Questions	Answered	Successfully Answered	URL
17965	ACE-335	To start with your last question, you can attach a patch by pressing "More Actions" and then choosing "Attach Files". What kind of classes could not be found before you used a specific version of osgi.core, because I assumed that all OSGi releases so far have been backward compatible. Or was something even older than 4.1.0 being used? The changes so far make sense, Having the repository on the local drive is just a speed optimization and ideally we should still support both. However, we can do this one step at a time. Let's first make sure we migrate and can run the server and targets, plus all our tests, and then worry about the continuous build and how to setup everything for releases. Timing wise, it makes sense to do this migration now, since everybody will upgrade to Bndtools 2 now anyway.	0	0	https://issues.apache.org/jira/browse/ACE-335
17966	ACE-333	Do you want to use the sub-bundle feature from Bndtools?	1	1	https://issues.apache.org/jira/browse/ACE-333
17967	ACE-333	Got it. The only thing you have to be careful is if someone wants to use Maven for the Bundle build. Sub-bundles makes a headless build more difficult. But at this discussion: https://groups.google.com/forum/?hl=en&fromgroups=#!searchin/bndtools-users/sub$20bundles/bndtools-users/R3LnHluaTaM/kXuaBV2VxEMJ you explained a good strategy to solve that. Did you ever tried it?	1	1	https://issues.apache.org/jira/browse/ACE-333
17968	ACE-333	Great! Shall I take steps for this issue? Would write a list of components I see and their sub-bundles as a comment and after we discussed and adjusted that structure if needed, I can start to map it the current trunk. What do you think?	1	1	https://issues.apache.org/jira/browse/ACE-333
17969	ACE-333	Sure. So lets talk about it next week?	0	0	https://issues.apache.org/jira/browse/ACE-333
17970	ACE-316	Going towards R5 repositories seems an interesting direction. What would be the effects from a functional perspective?	0	0	https://issues.apache.org/jira/browse/ACE-316
17971	ACE-316	Comitted in r1468366. The OBR is now in control of the location on disk an this is reflected in the API. A create is will return an 201 with a location header identifying where the resource is located. The layout is based upon bsn/version (eg. org/apache/bla/org.apache.bla-1.0.0.jar). The default strategy for determining bsn/version is based upon the bundle manifest headers. If the resource is not a bundle a fallback to the now optional filename parameter is attempted expecting something like <bsn>(-<version>)?(.<extension>)?. If a bsn but no version is found the version defaults to "0.0.0". A complicating factor proved to be the VelocityArtifactPreprocessor that also uploads processed templates. As i duplicates the OBR upload logic and made assumption on that it could assume filename I had to make some behavioral changes there. As for configuration resources we must use the filename strategy mentioned above it does the following; Assuming the template is of form <bsn>-<version>.<extension> a generated variant will be of form <bsn>.<targetID>-<targetVersion>.<extension>. Questions: * OBR upload code is duplicate over the ArtifactRepositoryImpl and the VelocityArtifactPreprocessor passing the OBR around as a string uri. Should we not introduce a client service and/or will that be adressed when we introduxe real repository services? * Should the VelocityArtifactPreprocessor (mis)use the obr? We can not assume that that will work with an actual (upstream) repository service in the future and it is creating a lot of garbage in there. Why not keep those generated variants local?	1	0	https://issues.apache.org/jira/browse/ACE-316
17972	ACE-302	I definitely don't object to adding the lists to Nabble. Would others be interested in this as well?	1	1	https://issues.apache.org/jira/browse/ACE-302
17973	ACE-302	Since no one seems to be interested, what do you think [~marrs] to close this one?	1	0	https://issues.apache.org/jira/browse/ACE-302
17974	ACE-301	Is this still an issue? At present the build source/target is at 1.6 and I have no trouble building with this setting or even 1.7 :) My jdk: {code} "1.7.0_17" Java(TM) SE Runtime Environment (build 1.7.0_17-b02) Java HotSpot(TM) 64-Bit Server VM (build 23.7-b01, mixed mode) {code}	1	0	https://issues.apache.org/jira/browse/ACE-301
17975	ACE-289	what about "after->configureAdditionalServices" and "before->configureProvisionedServices"?	1	0	https://issues.apache.org/jira/browse/ACE-289
17976	ACE-289	Please can someone review and apply that patch that we can close this issue :)	1	0	https://issues.apache.org/jira/browse/ACE-289
17977	ACE-249	Can you take a look and fix this?	1	1	https://issues.apache.org/jira/browse/ACE-249
17978	ACE-232	Attached a simple patch that seems to do the job. Needs testing. Note that I had to do a few import/export tweaks that may or may not make sense eg. excluding condperm 1.1	0	0	https://issues.apache.org/jira/browse/ACE-232
17979	ACE-217	Could you take a look at this?	1	0	https://issues.apache.org/jira/browse/ACE-217
17980	ACE-217	2) The artifacts column shows all artifacts in the current artifact-repository and you can remove them at will using the 'X'. I can see how tree-views and filters may help, but there is a separate issue for that at ACE-319 1) The 'Repository view' in the "Add bundles" dialog is filtered against the current state of the artifact-repository. An initial approach is to allow deletion of these resources. There are some considerations though; * The fact that a resource is not referenced from the current artifact-repository doe NOT mean it is not referenced from older revision in the deployment-repository. Thus deleting a resource could break deployment packages for target at old/rollback versions. I see two ways to address this (at some point); First we could check all deployment revisions and state of targets and disallow deleting resources within some reasonable limit. However, this is probably pretty complex, expensive and hard to communicate to the user. The second approach is to introduce resource caching on the server so that it is no dependent on the user-managed / upstream repository when constructing a deployment package. I discussed this with Marcel before and IMHO that would be a far more robust approach that will also prepare us for multiple (upstream) repositories. * OBR management is somewhat scatted around the code base. In this case the OBR upload is encapsulated by the ArtifactRepositoryImpl and it does ot support delete. As proposed in ACE-341 the repository should become a first-class service allowing us to decouple repository management. Again something that will prepare is for multiple (upstream) OBRs where some will be manageable and some wont. This also relates to the R5 discussion at ACE-314. In the scope of this issues I propose to; * Allow deletes of resource in the OBR view because, as Paul argues, the OBR is private and are assumed to know what your are doing. * For the time being implement the delete functionality in the webui code, pending a OBR solution that covers the broader issues. WDYT?	0	0	https://issues.apache.org/jira/browse/ACE-217
17981	ACE-211	From that page; {quote} Binary Distributions What applies to canonical source distributions also applies to all redistributions, including binary redistributions: Any redistribution must obey the licensing requirements of the contents. The best way to do that will likely depend on the binary packaging form. When assembling binary distributions, it is common to pull in and bundle additional dependencies which are not bundled with the source distribution. These additional dependencies must be accounted for in LICENSE and NOTICE. As a result, the LICENSE and NOTICE files for a binary distribution may well differ from those in the source distribution it was built from. In any case, the principle remains the same: LICENSE and NOTICE must exactly represent the contents of the distribution they reside in. {quote} I interpret this as " we must maintain and include a LICENSE/NOTICE per bundle as well. Some may use a generic variant, some may be specific. Is that correct? The current build does not include any LICENSE/NOTICE into the bundles.	1	1	https://issues.apache.org/jira/browse/ACE-211
17982	ACE-194	Cool! That would be an interesting feature to add. Is there any progress on this to report?	0	0	https://issues.apache.org/jira/browse/ACE-194

#	Requirement	Questions	Answered	Successfully Answered	URL
17983	ACE-191	Three comments after reviewing this: Firstly, the ServerType (enum) class seems to be missing from this patch. Secondly, right now, you more or less "hardcode" the server types by explicitly creating an enum for them. That means that every time we want to add a new server type, we need to modify this code. I think we should try to make the server types configurable. Finally, there is a hardcoded link to an S3 file in the codebase right now. I understand that's where you now "parked" the GF zip file, but I think we should not hardcode such links. By solving remark #2 I'm hoping this one goes away as well. WDYT?	1	1	https://issues.apache.org/jira/browse/ACE-191
17984	ACE-191	I agree this shouldn't be hardcode. After discussing some options today I changed the amazon launcher to have more configuration options. With these changes, the code is completely generic as before, but can now be configured to download extra files from either the ACE obr or any external url. This is sufficient to bootstrap Glassfish, and I expect most other servers too. WDYT?	0	0	https://issues.apache.org/jira/browse/ACE-191
17985	ACE-191	The current composition of the ace-target-devserver always includes de amazon-nodelauncher. This component, on startup, always connects directly to amazon, with in my case, incorrect credentials. This gives a nasty and lengthy stacktrace in the logfile: 2011.10.27 14:24:29 WARNING - Bundle: org.apache.ace.nodelauncher.amazon - Invocation of 'start' failed. - org.jclouds.rest.AuthorizationException: POST https://ec2.us-east-1.amazonaws.com/ HTTP/1.1 -> HTTP/1.1 401 Unauthorized at org.jclouds.aws.handlers.ParseAWSErrorFromXmlContent.refineException(ParseAWSErrorFromXmlContent.java:117) (....) Is this as it should be ? I can image Ace being used without deployment to Amazon.... Is the idea to have a separate assembly for deployment to Amazon and for non-Amazon deployment, or will there be one Ace assembly for all kinds of deployments ? In the latter case, it might not be desirable to always connect directly to Amazon on the startup ?	1	0	https://issues.apache.org/jira/browse/ACE-191
17986	ACE-185	Thanks, Marcel. No problem about the empty blocks. I'm fully aware of different styles between people and between projects. Having a style guide around implies that it should be respected, thus my contributing the checkstyle file. Common sense is good and a zero warning policies evil (I know a place where some people really want that (and a zero FindBugs policy, too)). Interpreting the style guide, I've set many checks to produce "errors", rather than "warnings", since I did not know how seriously the style guide is to be taken inside the project. I encourage the Ace team to tweak those settings to their liking. My contribution is just a starting point. I suggest to leave at least the "tab" check and the "file header" check on "error" level. Placing the ZIP on the style guide page would not have been my first choice, though. I already mentioned that I had trouble finding that page. I fear that most people will miss it. Personally, I'd have added the two files to https://svn.apache.org/repos/asf/incubator/ace/trunk. There you're bound to stumble over it.	1	1	https://issues.apache.org/jira/browse/ACE-185
17987	ACE-180	Issue has been resolved for a long time, waiting for potential confirmation from the reporter. Closing it now.	0	0	https://issues.apache.org/jira/browse/ACE-180
17988	ACE-146	These features will probably be subsets of the total assemblies we use now for these different targets. We can leave out Pax Runner that currently bootstraps a target and loose the existing shell. Other than that, it's probably straightforward to come up with these features. Do we want to create a new module 'ace-karaf' as a home for these descriptors?	1	1	https://issues.apache.org/jira/browse/ACE-146
17989	ACE-136	Has long been moved to branches/legacy-ant so it's no longer part of the normal build.	0	0	https://issues.apache.org/jira/browse/ACE-136
17990	ACE-106	Is there a current version somewhere?	1	0	https://issues.apache.org/jira/browse/ACE-106
17991	ACE-103	Implemented, can someone else test this and give me some feedback?	0	0	https://issues.apache.org/jira/browse/ACE-103
17992	ACE-102	Issue has been resolved for a long time, waiting for potential confirmation from the reporter. Closing it now.	1	1	https://issues.apache.org/jira/browse/ACE-102
17993	ACE-101	Given the latest sources, this would now be possible. You can disable the default discovery service by adding "-Dorg.apache.ace.discovery.property=disabled" to the MA startup, and plug in your own discovery service by adding the MA-option "bundle=my.own.discovery.Activator" (given that the custom discovery bundle is added to the class path). For example: [localhost:~/]$ java -cp org.apache.ace.launcher-0.8.1-SNAPSHOT.jar:my.own.discovery-0.0.1.jar -Dorg.apache.ace.discovery.property=disabled bundle=my.own.discovery.Activator identification=MyTarget Does this cover this issue? If so, can it be closed?	0	0	https://issues.apache.org/jira/browse/ACE-101
17994	ACE-100	Issue has been resolved for a long time, waiting for potential confirmation from the reporter. Closing it now.	0	0	https://issues.apache.org/jira/browse/ACE-100
17995	ACE-94	This is somwhat strange, can you give a hint: which goals do you run ? e.g. "clean install" ?? Also, can you provide a full log? I am not fully aware that we do use 2.0.x incompatible plugins - but may be. Besides that, i would rather recommend running with Maven 3, as i don't see the benefit of using outdated Maven versions. Its a tool, its free and you get everything but old strange issues with 2.0.x versions. Its true, corporates cannot move with any Maven release cycle, but on the other hand, tools get better over time, you lose less time running into corner-issues, get better error messages, faster builds. -> I know, you just point to adding the "prerequisites" configuration. Just wanted to get behind the reason of keeping 2.0.x alive.	0	0	https://issues.apache.org/jira/browse/ACE-94
17996	ACE-94	> This is somwhat strange, can you give a hint: which goals do you run ? e.g. "clean install" ?? > Also, can you provide a full log? Attached > I know, you just point to adding the "prerequisites" configuration. Just wanted to get behind the reason of keeping 2.0.x alive. It is not by choice! I have to keep some software compatible with it. I switch between 2.0.11, 2.1.1. en 3.0 all day. My env just happend to be set to 2.0.11 when I tried to build Ace. So be my guest and add prerequisites 3.0. I would do the same for my package if the boss would let me ;)	0	0	https://issues.apache.org/jira/browse/ACE-94
17997	ACE-79	Angelo, could you take a look at these?	1	1	https://issues.apache.org/jira/browse/ACE-79
17998	ACE-79	A couple of tweaks I needed to to to get tests going under mvn... 1) Hack IntegrationTestBase by adding empty public cleanup() to get things to compile. Do you have a local modification somewhere? 2) Add explicit surefire plugin configuration doing two things: 2a) Tweak pax-runner config to run on integration-test phase instead of test phase so you will anoy less people with all this testing :) 2b) The parent brings in a testng dep which messes up the testrunner somehow. Disable it in the execution by specifying a non existing testNGArtifactName Now I still have some test failing but I'm not sure thats a mvn problem as I get the same exceptions in eclipse? Tests in error: foo(org.apache.ace.it.server.AssemblyConfigureTest) initializationError0(org.apache.ace.it.server.MinimalGatewayTest)	1	1	https://issues.apache.org/jira/browse/ACE-79
17999	ACE-78	This task indeed applies to the unit tests. Porting the integration tests is ACE-79. If you're confident all are ported, you can close the issue. Great work!	1	1	https://issues.apache.org/jira/browse/ACE-78
18000	ACE-74	dont we have that already ?	1	0	https://issues.apache.org/jira/browse/ACE-74
18001	ACE-71	Depending INFRA has just been resolved. Can someone with enugh rights create a CI build for both, the ant build as well as the maven build ? Once this is done, it would be great to have the maven artifacts being deployed somewhere (original reason of the hudson move).	0	0	https://issues.apache.org/jira/browse/ACE-71

#	Requirement	Questions	Answered	Successfully Answered	URL
18002	ACE-69	I've checked in some changes for this, but I'm not sure of the environment that the webapp is supposed to live in. Assuming it's a bundle, but there's some other strangeness that follows if the project type isn't 'war', so it's probably going to take a few extra steps to get the bundle manifest generated with the war. What is the typical deployment container for an OSGi-based webapp?	1	1	https://issues.apache.org/jira/browse/ACE-69
18003	ACE-69	Hi Brian, yeah, about the "packaging=war" in ace-webui: well, usually you can deploy wars right away with paxweb or new R4.2 (enterprise) web container impls. Though i've seen that the ant based web ui is packaged as a normal bundle, also setting their own osgi headers. So, i would do the same in our build: make it a normal bundle, put resources into src/main/resources instead src/main/webapp and try to tweak things the way the original looks like for now Sure, in the very end we could end up with a single war, too but then we change things already in this transition phase. wdyt ?	1	0	https://issues.apache.org/jira/browse/ACE-69
18004	ACE-67	Toni, are you still working on this? Currently, this is not a blocking issue for the Maven conversion, but I'm leaving it open in case you still intend to do this. If not, feel free to close it.	1	1	https://issues.apache.org/jira/browse/ACE-67
18005	ACE-62	Brian, I tried: git push git@github.com:topping/Apache-Ace-Mavenization.git But I got! ERROR: Permission to topping/Apache-Ace-Mavenization denied to jbonofre. fatal: The remote end hung up unexpectedly Could you give write permission on the repo for my github user (jbonofre) ? Thanks JB	1	1	https://issues.apache.org/jira/browse/ACE-62
18006	ACE-62	Hi Jean-Baptiste, I've added you and Tony. Can you confirm that you have access? Cheers, Brian	1	0	https://issues.apache.org/jira/browse/ACE-62
18007	ACE-62	Hi gang, sorry I've been AWOL, I'm just getting a new client squared away from a narrowly-avoided catastrophe. I'm not much of a git user, Toni, do you need to push something? I am cloned off github, and if I look at http://github.com/topping/Apache-Ace-Mavenization, I don't see any of your changes. I'm grateful you did the import and can manage that though, because I have no experience with this svn<->git coexistence thing yet. Otherwise, your approach looks great to me. Maybe we should use this jira issue for module synchronization so we don't step on each other. Question about source moves: Under SVN, the history is kept with a move, but will that history be kept in git or will it need to be done again manually in svn once we have the POM set finished? Just curious, seems like we can manage it in any event. Anyway, I am checked out, looking forward to putting in some time on this now that this client has some tasks to do on their end. Cheers, Brian	1	0	https://issues.apache.org/jira/browse/ACE-62
18008	ACE-61	New exception (used in previous patch) to simplify error handling in rest servlets. Once in a while, this exception should be (if finally accepted) staged up to a higher package. Will then probably be used by other ace rest servlets.	1	0	https://issues.apache.org/jira/browse/ACE-61
18009	ACE-56	How to use latest patch: - apply from ace root, you will get a new subproject called devtools - just src are included - compile-dependencies: java5, osgi core api - runtime dependencies: equinox 3.5+ or felix 2.0+ There is a unclear behaviour when using felix, which has to be debugged from a felix point of view (unrelated to ace). However both should work. I used equinox (for the time being).	1	0	https://issues.apache.org/jira/browse/ACE-56
18010	ACE-56	How relevant is this patch? It's been around for a while, and probably could be updated to work with the new Maven build, but mostly I use a remote debugger whenever I want to debug an ACE node (server or target). Moving to OSGi 4.2 and using the new launcher API should make this patch a lot easier though. Toni, do you still want to pursue this?	1	1	https://issues.apache.org/jira/browse/ACE-56
18011	ACE-46	There are three directions we could go in here: 1) Adding a feature to the "choose your bundle" dialog to import artifacts from Nexus. Each imported bundle is then copied to the "internal" OBR of ACE. 2) Adding a feature to the "choose your bundle" dialog to import artifacts from Nexus without copying them to the "internal" OBR of ACE. 3) Using Nexus as the "internal" OBR of ACE. I would prefer going with option 1, or maybe 2. 3 is more work since we would then have to support "uploading" bundles to Nexus too (and the "internal" OBR also supports adding different types of artifacts). A more advanced version of 1) would be a version where, if you select a bundle in Nexus, it: a) wraps it into a bundle if it is not already one (probably by using Pax URL), or b) analyze dependencies and present you with options to import those too, maybe even automatically create a group for all those dependencies. WDYT?	1	1	https://issues.apache.org/jira/browse/ACE-46
18012	ACE-33	I noticed that Pax Web 0.6.0 can find a port itself; might that help us in this case? see http://wiki.ops4j.org/display/paxweb/Pax+Web+-+0.6.0 , http://issues.ops4j.org/jira/browse/PAXWEB-126	1	0	https://issues.apache.org/jira/browse/ACE-33
18013	ACE-32	Patch adds two new things to the "ant package" phase for dev-server. I just went for one particuar target to let you cross check which direction we go and what to expect. 1. core/deploy/target/dev-server/paxrunner/ A folder with just a script that calls the original pax runner at runtime. just call "./run.sh" on the folder stated above. 2. core/deploy/target/dev-server/standalone this calls pax runner at build-time (inside ant) and let it construct a particuar platform output. The final folder contains routly (or should at least) an output that very much looks like the current target output. So, you also can call "run.sh" here. Look inside to see that there is no pax runner involved anymore. Benefit when compared to the current approach: framework independence Where is the configuration ? No real user configuration is done in the build scripts. All configurations are read from core/conf/<target>/ For Pax Runner we have two configurations there: --> platform.setup There you specify the normal pax runner options. This includes the selection of the framework (felix,equinox,knopflerfish,concierge) and its versions. --> platform.properties additional properties that are needed to be configured as "environment" properties (-D) like http.port and others.	1	0	https://issues.apache.org/jira/browse/ACE-32
18014	ACE-32	thanks for applying! I think now is also a good time to get rid of (now unused) checked in libraries like felix. Having them still in leads to the assumption that thats being used (which it is - at least shoud - not). wdyt ?	0	0	https://issues.apache.org/jira/browse/ACE-32
18015	ACE-29	Committed quite a big refactoring this morning. This should now work. Does anybody want to validate that it actually does (beyond "my machine" ;))?	0	0	https://issues.apache.org/jira/browse/ACE-29
18016	ACE-27	This patch adds a working bundle columns, which filters out all other artifacts than bundles. Next up: bundle creation.	1	1	https://issues.apache.org/jira/browse/ACE-27
18017	ACE-27	This patch adds the possibility to import bundles from an OBR running on the same server. Furthermore, some minor layout changes.	1	1	https://issues.apache.org/jira/browse/ACE-27
18018	ACE-23	Also, wouldn't it be better to group the related tasks for the GWT based web UI under a common WebUI Task ? That way we can see the relationship and also see your idea a bit better what is missing to satisfy the initial goal.	1	0	https://issues.apache.org/jira/browse/ACE-23
18019	ACE-23	@Angelo: Pax web extender does not exist anymore. Its now part of pax web: org.ops4j.pax.web-extender:pax-web-ex-war -> org.ops4j.pax.web:pax-web-extender-war But 0.7.0 has not been released yet. Should i bounce alin ??	1	0	https://issues.apache.org/jira/browse/ACE-23
18020	ACE-23	@Toni Right, I got this jar from the pax-web website. It would be nice if we could get a release, could you do the honors for that?	1	0	https://issues.apache.org/jira/browse/ACE-23
18021	ACE-20	About the off-the-shelf Felix: The Felix downloads website still pointed to 1.8.0. I built this framework from the svn tag, and we have some custom properties in the config.properties file. About the MultiFrameworkStarter: do you know whether something like Pax Runner can be made to run multiple frameworks in the same VM? That would solve the same problem.	1	1	https://issues.apache.org/jira/browse/ACE-20

#	Requirement	Questions	Answered	Successfully Answered	URL
18022	ACE-20	Yep i am actually using just Pax Runner/Exam to start Ace stuff.. but i am not 100% sure about what the MuliFrameworkStarter is about.. what is it good for ?	0	0	https://issues.apache.org/jira/browse/ACE-20
18023	ACE-19	@Marcel, are you doing this as part of the svn import or should i provide a patch ?	0	0	https://issues.apache.org/jira/browse/ACE-19
18024	ACE-19	Would be good if we also can get rid of the "liq" naming ? Or does it have any meaning in ace ? I would replace it with "core" if we stay with the current structure.. (server,liq/core,gateway). Same is true for liq referals in build.xml (project name) Patch not necessary i guess ;)	1	0	https://issues.apache.org/jira/browse/ACE-19
18025	ACE-18	Is it normal that i cannot assign tasks to myself ?	1	0	https://issues.apache.org/jira/browse/ACE-18
18026	ACE-18	@Marcel, what is about this one, do we have concrete idea on what is need in addition for this? Ideas ? You mentioned the automatic versioning thing from DevCon, but i don't see the short term releationship to this (simple) maven export.. hints? Would help out here if i would know "what to do" ;)	1	0	https://issues.apache.org/jira/browse/ACE-18
18027	AMQ-6585	[~chris@die-schneider.net], Do you have any thoughts on the best way to go about this? I think one issue is going to be that the spring-xbean bundle still has a dependency on Spring 3.2.x and there is no updated bundle for Spring 4.x so we may need to repackage it.	1	1	https://issues.apache.org/jira/browse/AMQ-6585
18028	AMQ-6585	I think it would be better to move the whole camel code into the camel repository. Not sure if the camel plugin would then still be feasible though. How important is the camel plugin for activemq users? I personally never used it and also do not know anyone who used it.	0	0	https://issues.apache.org/jira/browse/AMQ-6585
18029	AMQ-6585	I'm not really sure how important it is, I've never used it either. [~tabish121] and [~gtully], what are your thoughts on this?	1	1	https://issues.apache.org/jira/browse/AMQ-6585
18030	AMQ-6581	It's always tough to pick the right log level for some messages as the level really depends on the use case. In the case of expired messages, sometimes they are expected and other times it might indicate a larger issue that needs troubleshooting as in your case. It seems like logging expired messages at level WARN is too high to me even though, generally speaking, most messages would probably be expired on the broker side before dispatch so this scenario shouldn't happen too often. Would the INFO level be acceptable in your use case?	1	1	https://issues.apache.org/jira/browse/AMQ-6581
18031	AMQ-6571	Thank you for the quick turnaround - much appreciated. Is there a rough timeline for 5.15.0 vs. 5.14.4 (and other 5.14.x)?	1	1	https://issues.apache.org/jira/browse/AMQ-6571
18032	AMQ-6503	You need to have an ICLA on file to be granted access to modify the wiki. https://www.apache.org/dev/new-committers-guide.html#cla Have you submitted one yet?	0	0	https://issues.apache.org/jira/browse/AMQ-6503
18033	AMQ-6428	Can you squash the commits and rebase? After a quick glance this looks pretty good and I saw that you commited a similar patch to Artemis so it makes sense to have matching test utilities in this project as well.	1	1	https://issues.apache.org/jira/browse/AMQ-6428
18034	AMQ-6428	I tried squashing my two commits, but I think I screwed something up - the PR is showing a bunch of other commits from other people. I'm not exactly sure how to fix this other than closing the current PR and opening a new one. Is there an easier way?	1	1	https://issues.apache.org/jira/browse/AMQ-6428
18035	AMQ-6408	Commit 8e994366b3c5e7540296d80a12ae2569010743cb in activemq's branch refs/heads/activemq-5.14.x from [~tabish121] [https://git-wip-us.apache.org/repos/asf?p=activemq.git;h=8e99436] https://issues.apache.org/jira/browse/AMQ-6408 Update to latest proton-j 0.14.0 (cherry picked from commit 1595912bbf3225c8d1a92cf9a0d54746756c6c12)	1	1	https://issues.apache.org/jira/browse/AMQ-6408
18036	AMQ-6403	Commit 5a874816b74a485822bcb60e1cf7fc550644d62a in activemq's branch refs/heads/master from [~gtully] [https://git-wip-us.apache.org/repos/asf?p=activemq.git;h=5a87481] AMQ-6403 - add indexDirectory attribute to kahadb plist impl - settable via broker service tempDataStore	1	1	https://issues.apache.org/jira/browse/AMQ-6403
18037	AMQ-6403	Commit f0d898cc9d7cbeea19ee54334e504ac52ef854cc in activemq's branch refs/heads/activemq-5.14.x from [~gtully] [https://git-wip-us.apache.org/repos/asf?p=activemq.git;h=f0d898c] AMQ-6403 - add indexDirectory attribute to kahadb plist impl - settable via broker service tempDataStore (cherry picked from commit 5a874816b74a485822bcb60e1cf7fc550644d62a)	1	1	https://issues.apache.org/jira/browse/AMQ-6403
18038	AMQ-6397	This change makes sense as the value should apply to both sends/receives. One thing I did notice is that with this change the timeout period will now be cached permanently since it will be set only once on the client creation which is then cached. The way it is currently constructed, the timeout is set on every send so in theory the timeout could be changed later via the setter. I don't really think this is an issue as the original intention was probably to configure the setting once and not change it later. What do you think [~tabish121] ?	1	1	https://issues.apache.org/jira/browse/AMQ-6397
18039	AMQ-6362	Commit a65f5e7c2077e048a2664339f6425d73948d71ce in activemq's branch refs/heads/master from [~gtully] [https://git-wip-us.apache.org/repos/asf?p=activemq.git;h=a65f5e7] AMQ-6362 - merge duplicated code - fix regression in AMQ4889Test and ExceptionListenerTest	1	0	https://issues.apache.org/jira/browse/AMQ-6362
18040	AMQ-6349	I already have an edited version of the web console on my desktop. Is there a way to upload it?	1	1	https://issues.apache.org/jira/browse/AMQ-6349
18041	AMQ-6339	Commit 34d7b0bfcb3a3d61ffe961f53ed5824d54aac232 in activemq's branch refs/heads/master from [~tabish121] [https://git-wip-us.apache.org/repos/asf?p=activemq.git;h=34d7b0b] https://issues.apache.org/jira/browse/AMQ-6339 Update to latest Netty 4.0.x release	1	1	https://issues.apache.org/jira/browse/AMQ-6339

#	Requirement	Questions	Answered	Successfully Answered	URL
18042	AMQ-6301	but was temporarily disabled because of the Karaf issues) The problem is now that spring dm is embedded, it avoids the Karaf issue but the OsgiBundleXmlApplicationContext still has a dependency on Spring and doesn't work properly with Spring 4. Specifically I'm seeing a NoSuchMethodError because it relies on a deprecated method that was removed. Spring DM probably needs to go away entirely for the correct fix. {noformat} java.lang.NoSuchMethodError: org.springframework.core.CollectionFactory.createConcurrentMap(I)Lorg/springframework/core/ConcurrentMap; at org.springframework.osgi.util.internal.ClassUtils.<clinit>(ClassUtils.java:164) at org.springframework.osgi.context.support.TrackingUtil.getService(TrackingUtil.java:160) at org.springframework.osgi.context.support.OsgiBundleXmlApplicationContext.lookupNamespaceHandlerResolver(OsgiBundleXmlApplicationContext.java:243) at org.springframework.osgi.context.support.OsgiBundleXmlApplicationContext.createNamespaceHandlerResolver(OsgiBundleXmlApplicationContext.java:201) at org.springframework.osgi.context.support.OsgiBundleXmlApplicationContext.access$000(OsgiBundleXmlApplicationContext.java:60) at org.springframework.osgi.context.support.OsgiBundleXmlApplicationContext$1.run(OsgiBundleXmlApplicationContext.java:124) at java.security.AccessController.doPrivileged(Native Method)[:1.8.0_60] at org.springframework.osgi.context.support.OsgiBundleXmlApplicationContext.loadBeanDefinitions(OsgiBundleXmlApplicationContext.java:119) at org.springframework.context.support.AbstractRefreshableApplicationContext.refreshBeanFactory(AbstractRefreshableApplicationContext.java:129) at org.springframework.context.support.AbstractApplicationContext.obtainFreshBeanFactory(AbstractApplicationContext.java:605) at org.springframework.context.support.AbstractApplicationContext.refresh(AbstractApplicationContext.java:509) at org.springframework.osgi.context.support.AbstractDelegatedExecutionApplicationContext.access$301(AbstractDelegatedExecutionApplicationContext.java:69) at org.springframework.osgi.context.support.AbstractDelegatedExecutionApplicationContext$1.run(AbstractDelegatedExecutionApplicationContext.java:186) at org.springframework.osgi.util.internal.PrivilegedUtils.executeWithCustomTCCL(PrivilegedUtils.java:85) at org.springframework.osgi.context.support.AbstractDelegatedExecutionApplicationContext.normalRefresh(AbstractDelegatedExecutionApplicationContext.java:182) at org.springframework.osgi.context.support.AbstractDelegatedExecutionApplicationContext$NoDependenciesWaitRefreshExecutor.refresh(AbstractDelegatedExecutionApplicationContext.java:89) at org.springframework.osgi.context.support.AbstractDelegatedExecutionApplicationContext.refresh(AbstractDelegatedExecutionApplicationContext.java:175) at org.apache.activemq.osgi.ActiveMQServiceFactory.updated(ActiveMQServiceFactory.java:102) at org.apache.felix.cm.impl.helper.ManagedServiceFactoryTracker.updated(ManagedServiceFactoryTracker.java:159)[7:org.apache.felix.configadmin:1.8.8] at org.apache.felix.cm.impl.helper.ManagedServiceFactoryTracker.provideConfiguration(ManagedServiceFactoryTracker.java:93)[7:org.apache.felix.configadmin:1.8.8] at org.apache.felix.cm.impl.ConfigurationManager$UpdateConfiguration.run(ConfigurationManager.java:1753)[7:org.apache.felix.configadmin:1.8.8] at	1	1	https://issues.apache.org/jira/browse/AMQ-6301
18043	AMQ-6301	Can we target this issue for ActiveMQ 5.14? I would hate to see it get released and have OSGi compatibility with Spring 4.X still remain broken.	1	1	https://issues.apache.org/jira/browse/AMQ-6301
18044	AMQ-6274	There is already a property called originalDestination that is part of a Message. It should be set by the CompositeDestinationBroker so I don't think this is necessary. Can you see if that works for you? We try not to add headers to messages if we don't have to so that there are no conflicts with user defined headers. Also, in general, it's best to include a test or two when submitting a patch to verify that behavior works as intended. But in this case I think what you are trying to accomplish should already exist by using the property I pointed out above.	1	1	https://issues.apache.org/jira/browse/AMQ-6274
18045	AMQ-6274	The basic use case is wiretapping JMS Destinations to feed copies of the messages to another system for auditing purposes. The composite destinations work great for the wiretap - I can use a pattern to specify a group of destinations and where to forward copies. The problem is tracing the data in the audit system - I need a way to tell where the message originally came from. I worked around not having this feature in the past by putting my own JMS User Property on every message when I published it, but that proved to be error prone (i.e. it wouldn't get done once in a while for new destinations). Adding this type of functionality to the broker will eliminate those user-errors. Does that makes sense?	1	1	https://issues.apache.org/jira/browse/AMQ-6274
18046	AMQ-6274	OK - I updated the PR. Will this make it into 5.13.4? The customer I'm doing this for is using 5.13.2 right now and they need this - I'd rather not make them wait until 5.14 if at all possible.	1	1	https://issues.apache.org/jira/browse/AMQ-6274
18047	AMQ-6239	Thanks for the patch. This makes a lot of sense to me, no real reason I can see to create an array list when we can just use iterators. The only thing would be is if for some reason we wanted the iterator to not see future modifications. (since items are copied into lists, any future adds or removes while using the iterator wouldn't be seen). What do you think [~tabish121]?	1	1	https://issues.apache.org/jira/browse/AMQ-6239
18048	AMQ-6239	By the same logic, should we handle the situation of the underlying list getting extended concurrently? If so, then the "if (!orderedPendingList.isEmpty())" optimization (which was already there) in the ctor should be removed. I wonder if we are contemplating a use case that's not actually required..	0	0	https://issues.apache.org/jira/browse/AMQ-6239
18049	AMQ-6239	Would it be possible the change goes into the next release? The issue wastes an amazing amount of CPU, as can be seen for example by attached JFR.	0	0	https://issues.apache.org/jira/browse/AMQ-6239
18050	AMQ-6192	Using the content length is a simple way to check if it is a bytes message or should be converted using a transformer. That being said, I don't see why the logic couldn't be changed to first check for a transformation header and to honor that if it exists before going the byte message route. If that header is specifically set it seems like it would be best to honor that regardless of whether or not the content-length is set. (as you pointed out the spec says it should include it anyways) [~tabish121], What do you think about this change?	1	1	https://issues.apache.org/jira/browse/AMQ-6192
18051	AMQ-6184	We need the best of both worlds, depending on the use case. The default is a SynchronousQueue as before. I added:{code} org.apache.activemq.transport.nio.SelectorManager.workQueueCapacity{code} when > 0, it will swap out the SynchronousQueue for a capacity limited queue with the specified workQueueCapacity In this way, a limited pool (one that is at maximumPoolSize) can queue up some work before getting rejected and falling back to use the calling thread.	0	0	https://issues.apache.org/jira/browse/AMQ-6184
18052	AMQ-6182	The security dept ask me to disable "TRACE method" on this port 61614. I saw that it's disable for default on port 8161 where are the webapps admin, hawtio, etc. (at org/eclipse/jetty/webapp/webdefault.xml for jetty webserver there is a <security-constraint>) Is possible disable it on port 61614 too ? Please could someone tell me how to do that ...	1	1	https://issues.apache.org/jira/browse/AMQ-6182
18053	AMQ-6182	Hi Christopher, I hope this is the version https://git-wip-us.apache.org/repos/asf?p=activemq.git;h=473b328 which disables http trace method. Could you please help me to figure it out. Thanks in advance	1	1	https://issues.apache.org/jira/browse/AMQ-6182

#	Requirement	Questions	Answered	Successfully Answered	URL
18054	AMQ-6147	Did a quick test of Qpid JMS against a 5.14.0-SNAPSHOT build that sets the 'setEmitFlowEventOnSend' to false and the zero prefetch integration test 'JmsZeroPrefetchTest.testTwoConsumers' fails every time so there's some work needed to understand the nature of the change in behavior.	1	1	https://issues.apache.org/jira/browse/AMQ-6147
18055	AMQ-6135	Is there anything else I need to do to get this accepted?	1	0	https://issues.apache.org/jira/browse/AMQ-6135
18056	AMQ-6135	Is there a timeframe for getting this merged, rejected or at least commented upon?	1	0	https://issues.apache.org/jira/browse/AMQ-6135
18057	AMQ-6119	Can you indicate where the documentation was that you refer to, so that it can be updated? ActiveMQ has required at least Java 7 for a while now.	1	1	https://issues.apache.org/jira/browse/AMQ-6119
18058	AMQ-6118	When you say you tried to set it in the activemq file, do you mean activemq.bat? Because I think you can set ACTIVEMQ_SSL_OPTS in activemq.bat for Windows and it should get passed the java command.	1	1	https://issues.apache.org/jira/browse/AMQ-6118
18059	AMQ-6118	Thank you Christopher. Do you mean to set it like this in activemq.bat: set ACTIVEMQ_SSL_OPTS="-Dcom.sun.security.enableCRLDP=true -Docsp.enable=true -Docsp.responderURL=http://myOCSP-url" When I echo the ACTIVEMQ_SSL_OPTS, I get exactly my configured line. Could you please tell me when I have to execute the activemq.bat? Also I asked myself when does Activemq check the CRL via OCSP (when Client is connecting or earlier)? Sorry for that many questions but I got no luck on the mailinglists. many thanks in advance, Marko	1	0	https://issues.apache.org/jira/browse/AMQ-6118
18060	AMQ-6118	Okay, I've set the OCSP command in the activemq.bat and started the broker via activemq-admin.bat. Now my JVM has this arguments stored. I'm able to see it through jconsole. My Client, which is revoked by the ocsp responder, connects successfully as before - without any log entry. Also I can't see any try to connect my ocsp responder via http port 80 in my Firewall logs. Any ideas how to get it work? What could it be? (And how does it work with linux?) I've attached a screenshot showing my jconsole output with the jvm arguments successfully applied.	1	0	https://issues.apache.org/jira/browse/AMQ-6118
18061	AMQ-6118	Hey Christopher, thanks for your opinion. The post you linked in above, is from me. Could you tell me how to raise this request into "needs_review" section? Or how to create a feature request? I spent some time on an alternative idea with the static crl list. I could bring in an idea for adding the crl list loadup to the runtime configuration. So it's possible for the users to load it manually without broker restart. That's an alternative way to get client certificates managed. It would be very glad, when this feature would be reviewed in total.	0	0	https://issues.apache.org/jira/browse/AMQ-6118
18062	AMQ-6118	Wow, thank you! Dejan you're the man. Could you introduce me into the Windows Distribution? I'm confused setting the ACTIVEMQ_SSL_OPTS. Where do I have to set all the configurations in Windows Distribution? Thanks for reply. much regards	0	0	https://issues.apache.org/jira/browse/AMQ-6118
18063	AMQ-6106	Thanks for the pull request...this is a good start but the main thing missing would be a way to configure the BrokerService before calling start. Maybe having an initialization method that gets called before starting the broker would be a good idea. Each test typically has a different broker configuration and being able to do something like the following in a unit test would be necessary to make the Rule usable. {code:java} @Rule public EmbeddedActiveMQBroker broker = new EmbeddedActiveMQBroker() { @Override public void init() { brokerService.setKeepDurableSubsActive(false); } }; {code} [~tabish121], Do you think this is a good spot for this which is currently a new subproject called activemq-junit under tooling? It seems like a good place to me because then it can be included in other modules for testing like activemq-http or activemq-unit-tests as a testing dependency.	1	1	https://issues.apache.org/jira/browse/AMQ-6106
18064	AMQ-6106	Would it be possible to get this incorporated into the upcoming 5.11.x/5.12.x/5.13.x releases? I know it works with these because I started using it with 5.11.x. There was the issue with AdvisoryMessages not working when a memory store was used, but that's been resolved and that was the only issues I've seen with this. The reason I ask is I've used this quite a bit in my Camel tests and I've had to copy it into several source structures - I'd really like to start using this version instead.	1	0	https://issues.apache.org/jira/browse/AMQ-6106
18065	AMQ-6100	Can we close this one out now [~dejanb]?	1	0	https://issues.apache.org/jira/browse/AMQ-6100
18066	AMQ-6099	Also, I'm not convinced you'd ever have more than 2 versions at once; you'd have to have messages that were stuck in the store for longer than the lifetime of a particular version, and only when the from version, intermediate version, and to version all used different versions of OpenWire. I guess it's possible, but it doesn't seem very likely. Either way, though, once you can handle two versions, is the code to support three actually that complicated? Is there even any code at all, once you have support for two versions?	1	1	https://issues.apache.org/jira/browse/AMQ-6099
18067	AMQ-6007	I wrote a little test and I was able to verify this behavior. It looks like this is a result of a rewrite done with the SchedulerBroker. If a scheduledJobId is already set on message send, the broker won't schedule the message and will send it immediately. This was done to prevent duplicates from being scheduled when running a network of brokers and to prevent overwriting a scheduled job. This jobId needs to be preserved on the message for things like the management destination. In your specific scenario, I think the best thing to do is probably to configure camel to exclude that property when re-sending. Will this work for you? I will add some documentation to the scheduler page to highlight this so that users know to make sure that property is not set when sending a scheduled message either manually or some other process such as Camel doing it.	1	1	https://issues.apache.org/jira/browse/AMQ-6007
18068	AMQ-6001	Commit 789419ab9d87b735688adb5843427fb4deaea590 in activemq's branch refs/heads/activemq-5.12.x from [~tabish121] [https://git-wip-us.apache.org/repos/asf?p=activemq.git;h=789419a] https://issues.apache.org/jira/browse/AMQ-6001 Refill credit at a slightly faster rate. (cherry picked from commit bbcd93803207f22d6c549bc79dd7d0c28e16be26)	1	1	https://issues.apache.org/jira/browse/AMQ-6001
18069	AMQ-5962	Commit caac4f784ff93de71b776cce19804907dda868ca in activemq's branch refs/heads/master from [~tabish121] [https://git-wip-us.apache.org/repos/asf?p=activemq.git;h=caac4f7] https://issues.apache.org/jira/browse/AMQ-5962 http-client v4.5.1 now latest.	1	1	https://issues.apache.org/jira/browse/AMQ-5962
18070	AMQ-5958	Commit ad00e1fe52bba3efab77f528712953fa8e9666ca in activemq's branch refs/heads/master from [~tabish121] [https://git-wip-us.apache.org/repos/asf?p=activemq.git;h=ad00e1f] https://issues.apache.org/jira/browse/AMQ-5958 Update commons pool2 to latest release: 2.4.2 as of now. This closes #139	1	1	https://issues.apache.org/jira/browse/AMQ-5958
18071	AMQ-5958	Commit 3ffbaf9d896f3bf16274438cdf53aac88bca26e9 in activemq's branch refs/heads/activemq-5.12.x from [~tabish121] [https://git-wip-us.apache.org/repos/asf?p=activemq.git;h=3ffbaf9] https://issues.apache.org/jira/browse/AMQ-5958 Update commons pool2 to latest release: 2.4.2 as of now. This closes #139	1	1	https://issues.apache.org/jira/browse/AMQ-5958
18072	AMQ-5949	Understood. Could we instead adjust the log level statements for failed deliveries from INFO to WARN?	0	0	https://issues.apache.org/jira/browse/AMQ-5949
18073	AMQ-5941	[~ben_nisbet] I have made this change on master which is 5.13-SNAPSHOT. Would you be able to test this out and verify the change works for you? I don't have a Weblogic instance to test on. I can also backport this to the 5.12 branch if needed.	1	1	https://issues.apache.org/jira/browse/AMQ-5941

#	Requirement	Questions	Answered	Successfully Answered	URL
18074	AMQ-5915	[~gtully], The main issue with the RuntimeConfigurationPlugin is that a lot of times I'll configure a broker just using the BrokerService and not the xml config. I've been looking at how the Runtime plugin works to add virtual destinations and I'd probably use a similar strategy that the plugin uses (ie call reapplyInterceptor() in AbstractRegion to reapply the virtual destinations) but I was thinking about adding addVirtualDestination/removeVirtualDestination methods to BrokerService so I could programmatically modify them without having to use xml config. What do you think?	1	1	https://issues.apache.org/jira/browse/AMQ-5915
18075	AMQ-5889	http://activemq.2283324.n4.nabble.com/nio-buffer-memory-problem-td4712706.html could the changes in this ticket lead to the behavior in this problem?	1	0	https://issues.apache.org/jira/browse/AMQ-5889
18076	AMQ-5879	Pretty sure it would log the stack trace if the log level is set to debug, many folks find the full stack trace on those error annoying when they are at warn level as there are valid cases where the transport can throw out an error such as connection drop. Can you peek again at the code and make sure just turning on debug level logging isn't enough?	0	0	https://issues.apache.org/jira/browse/AMQ-5879
18077	AMQ-5867	[~gtully] I have the need to support Networkconnector (Network connector needs to use SSL client authentication). This is not working because the sslcontext is being shared between the serverfactory and client factory and there is no way to tell the java ssl api to use a specific key for the server socket. I am thinking of the following changes Enhance the SSLContext to enable two stores one for server another one for other uses namely Networkconntector. <sslContext> <sslContext keyStore="file:${activemq.conf}/broker.jks" keyStorePassword="test" trustStore="file:${activemq.conf}/broker.ts" trustStorePassword="test" serverKeyStore="file:${activemq.conf}/broker-server.jks" serverKeyStorePassword="test" serverTrustStore="file:${activemq.conf}/broker.ts" serverTrustStorePassword="test" /> If the server store is not configured use the default store. This preserves the backward compatibility. Enahnce the sslContext class to handle both stores appropriately. Let me know your thoughts Thanks -MM </sslContext>	1	1	https://issues.apache.org/jira/browse/AMQ-5867
18078	AMQ-5777	The latest patch looks good, one thing I think you ought to consider though. Now that you've simplified the checks for action and header length I think the value of the StompFrameSize inner class in StompWireFromat is pretty small and the whole thing could be replaced by a single long value in StompWireFormat (reset on return from unmarshal) and also in StompCodec which does currently reset a class wide object on codec reset. This avoids the need to keep calculating the length on every byte read from the socket stream and if kept as a class variable in StompWireFormat it avoids the garbage of creating a the size object on each unmarshal call. What do you think? Given that StompFrameSize is passed to a couple methods you might keep it and just have it be an accumulator or just use an AtomicLong.	1	1	https://issues.apache.org/jira/browse/AMQ-5777
18079	AMQ-5774	How would you differentiate the use case for this vs the current maxFrameSize setting that is available on the transports now?	1	1	https://issues.apache.org/jira/browse/AMQ-5774
18080	AMQ-5774	The use case is similar in that the max size would be set to prevent a DOS attack. However, {{maxFrameSize}} is specific to OpenWire and a max message size is a more generic setting that can apply to any protocol. What about other formats like AMQP, MQTT, STOMP, etc....would {{maxFrameSize}} still apply with those other formats?. Also, what is the relation of an OpenWire frame to a message? Is the frame size always going to be the same size as the message or are the values different? (ie can a message be chunked up into more than one frame) It seems more logical to me to apply the limit to a specific message size than to specify it for a specific protocol.	1	1	https://issues.apache.org/jira/browse/AMQ-5774
18081	AMQ-5751	[~xabhi], this issue is something that is useful to me as well so I went ahead and implemented this and submitted a pull request. If this commit is accepted then this feature can be enabled by setting a property on a destination policy, called "maxDestinations". This will limit the number of created destinations to that number all destinations under that policy. For example: {code:xml} <policyEntry queue="q.>" maxDestinations="500" memoryLimit="1mb"> <!-- The maximum number of queues for this policy will be limited to 500 --> </policyEntry> {code} Can a commiter review my pull request and let me know if any changes should be made to it? Thanks, Chris	1	1	https://issues.apache.org/jira/browse/AMQ-5751
18082	AMQ-5748	Hi Christopher, this is a substantial contrib and it looks good :-) My first thought was how different would the be from mKahaDB with a store per destination and the existing store size metric. I guess that would be more coarse, but it would be per destination. I think that would need a tweak on mKahaDb to isolate the store size but that would be trivial in comparison. How would that map with your use case? On the change to messageStore, if the intent is some metric that is accessed frequently, maybe introduce a destinationStatistic that is backed and initialised by the index. It would mean that the calculation is always up to date and there will be not store block on the index iterations. Am I correct in thinking this is a precursor to doing flow control based on total message size, if that is the case it extending the destination statistic to encompass this would make sense. That is the pattern for messageCount.	1	1	https://issues.apache.org/jira/browse/AMQ-5748
18083	AMQ-5748	[~gtully] and [~tabish121], I have updated my pull request to add a new statistics object, {{MessageStoreStatistics}}. This bean is now used to track both the message count and message size of the store (and can be used for future stuff too). I updated {{getMessageCount}} to now be non-blocking as it delegates to the statistics bean instead. Can one of you take a look and let me know what you think? I believe the counters should be updated in the proper locations (and recovered properly on restart) but I could have missed something. Right now the bean is only updated in Kaha and the Memory message store. Would it be possible to get the final version of this patch into 5.12? I also noticed that a unit test was failing, the testRecoveryAfterCorruptionCheckSumExistingIndex method in JournalCorruptionEofIndexRecoverTest. I looked at for a little while but I haven't figured out what is wrong with it yet. I'll keep looking at it but if you notice anything obvious before I figure it out let me know. Thanks, Chris	1	1	https://issues.apache.org/jira/browse/AMQ-5748
18084	AMQ-5748	Yeah that makes sense. Did any other tests fail for you? If you want I can go back through and lower the values in all the tests to where I know it will always work versus trying to guess. For example, I could lower the messageSize test assertion that you pointed out to "> 20000". Since 20 messages are being sent and the payload is 1000 bytes it will always be at least 20000 no matter what happens in the future.	1	1	https://issues.apache.org/jira/browse/AMQ-5748

18085	AMQ-5748	- Store COMMIT FAILED: java.lang.NullPointerException at org.apache.activemq.store.memory.MemoryMessageStore.removeMessage(MemoryMessageStore.java:99) at org.apache.activemq.store.memory.MemoryMessageStore.removeMessage(MemoryMessageStore.java:86) at org.apache.activemq.store.memory.MemoryTransactionStore$4.run(MemoryTransactionStore.java:375) at org.apache.activemq.store.memory.MemoryTransactionStore$Tx.commit(MemoryTransactionStore.java:107) at org.apache.activemq.store.memory.MemoryTransactionStore.commit(MemoryTransactionStore.java:272) at org.apache.activemq.transaction.LocalTransaction.commit(LocalTransaction.java:70) at org.apache.activemq.broker.TransactionBroker.commitTransaction(TransactionBroker.java:252) at org.apache.activemq.broker.MutableBrokerFilter.commitTransaction(MutableBrokerFilter.java:117) at org.apache.activemq.broker.TransportConnection.processCommitTransactionOnePhase(TransportConnection.java:499) at org.apache.activemq.command.TransactionInfo.visit(TransactionInfo.java:100) at org.apache.activemq.broker.TransportConnection.service(TransportConnection.java:334) at org.apache.activemq.broker.TransportConnection$1.onCommand(TransportConnection.java:188) at org.apache.activemq.transport.ResponseCorrelator.onCommand(ResponseCorrelator.java:116) at org.apache.activemq.transport.MutexTransport.onCommand(MutexTransport.java:50) at org.apache.activemq.transport.vm.VMTransport.iterate(VMTransport.java:270) at org.apache.activemq.thread.PooledTaskRunner.runTask(PooledTaskRunner.java:133) at org.apache.activemq.thread.PooledTaskRunner$1.run(PooledTaskRunner.java:48) at java.util.concurrent.ThreadPoolExecutor.runWorker(ThreadPoolExecutor.java:1145) at java.util.concurrent.ThreadPoolExecutor$Worker.run(ThreadPoolExecutor.java:615) at java.lang.Thread.run(Thread.java:745) 2015-07-07 18:37:36,937 [/localhost#61-2] - WARN Service - Async error occurred: javax.transaction.xa.XAException: STORE COMMIT FAILED: Transaction rolled back at org.apache.activemq.transaction.LocalTransaction.commit(LocalTransaction.java:75) at org.apache.activemq.broker.TransactionBroker.commitTransaction(TransactionBroker.java:252) at org.apache.activemq.broker.MutableBrokerFilter.commitTransaction(MutableBrokerFilter.java:117) at org.apache.activemq.broker.TransportConnection.processCommitTransactionOnePhase(TransportConnection.java:499) at org.apache.activemq.command.TransactionInfo.visit(TransactionInfo.java:100) at org.apache.activemq.broker.TransportConnection.service(TransportConnection.java:334) at org.apache.activemq.broker.TransportConnection$1.onCommand(TransportConnection.java:188) at org.apache.activemq.transport.ResponseCorrelator.onCommand(ResponseCorrelator.java:116) at	0	0	https://issues.apache.org/jira/browse/AMQ-5748
18086	AMQ-5736	I would like to see this feature implemented as well but for now my project has worked around it by using Virtual Destinations to share subscriptions. ActiveMQ Artemis (the proposed name for the HornetQ donation) already supports JMS 2.0 so if Artemis becomes ActiveMQ 6 at some point in the future then ActiveMQ will get JMS 2.0 support at that point. Can someone from the PMC comment on whether or not there are any plans to add JMS 2.0 support to the 5.x broker? I'm assuming the answer is no since the current focus seems to be on getting Artemis to be the next generation of ActiveMQ.	0	0	https://issues.apache.org/jira/browse/AMQ-5736
18087	AMQ-5734	Dejan - can u peek at https://fisheye6.atlassian.com/changelog/activemq-git?cs=f5283a904589eb4a9344fe42885cdacf92de68dd i found that the retained message (body size ==0) was not being accounted for in the test. Can you verify that that message should be dispatched?	1	0	https://issues.apache.org/jira/browse/AMQ-5734
18088	AMQ-5706	That will be more difficult to achieve than it seems because durable topic subscribers share a single instance of the message. Flipping the redelivered flag for one would effect all of the rest. I guess the use case is valid for durable subs - but it would require some major surgery. Would virtual topics work in your use case?	1	0	https://issues.apache.org/jira/browse/AMQ-5706
18089	AMQ-5696	I'd like to see a set of messaging tools as well, but wouldn't want to pollute the activemq-client jar which should probably stay as slim as possible. What about a activemq-msgtool that uses activemq-client? It could combine simple put / get w/ the performance features? Other products have a simple msgput, msgget type cli that make it handy for admins to quickly assess brokers and broker networks	0	0	https://issues.apache.org/jira/browse/AMQ-5696

18091	AMQ-5692	Hi, It looks to me the soWriteTimeout way is just for this kind of issues and should be used. The inactivity monitor shouldn't do anything to terminate the connection when it is in writing status. The reason is that any connection in writing status means it is 'busy working', not inactive. What do you think? Howard	1	0	https://issues.apache.org/jira/browse/AMQ-5692
18092	AMQ-5678	I guess this is very similar to the AMQ-5522 case. Great idea though	1	1	https://issues.apache.org/jira/browse/AMQ-5678
18093	AMQ-5662	[~northlander], Do you mind doing a rebase on this and updating your PR now that 5.13.1 is out (there were some fixes done on the webconsole recently). This seems like a good candidate to be merged into a 5.14.0 release.	1	0	https://issues.apache.org/jira/browse/AMQ-5662
18094	AMQ-5659	thanks for the patch. One thought. Would it not be simpler to just break out of the loop on an exception? {code} } catch(IOException e) { break; // ensure we don't loop }{code}	1	0	https://issues.apache.org/jira/browse/AMQ-5659
18095	AMQ-5603	Is there any estimate for when this feature will be designed and implemented? Thanks -Bill	0	0	https://issues.apache.org/jira/browse/AMQ-5603
18096	AMQ-5603	[~ceposta] I extended scope to have a preallocate_async option - so that we fire a job to preallocate the next data file when we rotate. This seems to reduce latency jitter on publish but it needs validation on real hardware. On the kernel_copy strategy - I did not see any point to deleting/recreating the template file so that is changed. Can you peek at that? In an effort to keep this safe, the sync is very explicit in journal. The whole class was synchronized which had to change to allow contention on the nextWriteId between the appender and the async task.	1	1	https://issues.apache.org/jira/browse/AMQ-5603
18097	AMQ-5603	Commit 231679d936e986a00930a96cc859b0a5b6d77486 in activemq's branch refs/heads/master from [~gtully] [https://git-wip-us.apache.org/repos/asf?p=activemq.git;h=231679d] https://issues.apache.org/jira/browse/AMQ-5603 - don't async preallocate to keep match data file count	1	1	https://issues.apache.org/jira/browse/AMQ-5603
18098	AMQ-5573	Can you please document this option on http://activemq.apache.org/tcp-transport-reference.html also. I had to dig a lot into google and ActiveMQ nabble to find this little option. I have just one question, since it is a transport connection will this affect the TCP and NIO transport connections also? Because for them we already have maxFrameSize Thanks, Abhi	1	0	https://issues.apache.org/jira/browse/AMQ-5573
18099	AMQ-5558	[~dejanb], There's a user thread about this change here http://activemq.2283324.n4.nabble.com/activemq-all-jar-tight-coupling-with-log4j-td4710022.html in regards to adding the log4j confuration to the activemq-all jar. Do you think it makes sense to provide the log4j conf file separately? I know it's kind of nice to also provide the config file for a default logging configuration. There's probably not really a good answer as some people would want it included and some people would want the config separate to customize it.	1	0	https://issues.apache.org/jira/browse/AMQ-5558
18100	AMQ-5554	I think there are 2 separate issues, this is the simplest one. Steps to reproduce: Plain vanilla Karaf (2.3.9 or 2.4.1). Install *only* the activemq-blueprint feature (otherwise we end up in the 2nd scenario, a bit more complex). ActiveMQ 5.11.0 behaves the same way. {code} karaf@root> features:chooseurl activemq 5.10.1 Adding feature url mvn:org.apache.activemq/activemq-karaf/5.10.1/xml/features karaf@root> features:install activemq-blueprint karaf@root> features:list | grep activemq [installed] [5.10.1] activemq-client activemq-core-5.10.1 ActiveMQ client libraries [installed] [5.10.1] activemq activemq-core-5.10.1 ActiveMQ broker libraries [uninstalled] [5.10.1] activemq-broker-noweb activemq-5.10.1 Full ActiveMQ broker with default configuration [uninstalled] [5.10.1] activemq-broker activemq-5.10.1 Full ActiveMQ broker with default configuration and web console [uninstalled] [5.10.1] activemq-camel activemq-5.10.1 [uninstalled] [5.10.1] activemq-web-console activemq-5.10.1 [installed] [5.10.1] activemq-blueprint activemq-5.10.1 {code} From the console deploy the broker-blueprint.xml (attached to the deploy directory. It will work. However, using a custom plugin (uncomment one of the two lines) gives different errors. Arguably, using the spring namespace is not a smart idea and shouldn't even be attempted.	0	0	https://issues.apache.org/jira/browse/AMQ-5554

#	Requirement	Questions	Answered	Successfully Answered	URL
18101	AMQ-5552	I agree with some of the comments, I am mostly against this proposal. Will try to explain why. I agree for instance that running tests for hours unreliably gives a bad first impression. Quite horrible, I'd think, and not only first impression, second and third too. This proposal only addresses releases from the title of this issue. Time is not a problem as this is a one time excercise. Any entity/company who uses internal builds have no problem running it overnight, however long it takes, as long as the result is pretty much guaranteed. For us as a community is it enough to say that it's a good release it passed the smoke testing? I would say not, the ASF guidelines say the same thing. If the PMC votes an official release, we guarantee that it actually works, which is demonstrated by the tests that pass. Those that don't should be fixed or removed (if they serve no purpose). I understand the need to be pragmatic. However, even if we run the tests with -fae, if tests fail in a <module>, tests in all other modules that depend on it will not be run. Therefore failing tests may hide other failing tests, very hard or impractical to discover. There is another practical reason. At some point, I introduced a regression while merging to a branch. One of the best ways to identify the source is to use git bisect. Given the number of commits I needed some 7 iterations. Now with activemq, where it takes some 10 mins for a build skipping tests, plus running the test(s) you're interested, it would take at least 15-20 min per iteration. While a significant chunk of time, at least it's feasible. If the tests you start with are unreliable, it's a much, much harder effort. There are other arguments, community related. I don't know what would constitute resolution of this issue. In my opinon certainly not something that would be at odds with the ASF guidelines for releases, or at least they way I understand them.	0	0	https://issues.apache.org/jira/browse/AMQ-5552
18102	AMQ-5537	I hope I was not too rude by specifying Fix Version as 5.11. Where is the place or the mechanism to discuss such enhancement requests?	0	0	https://issues.apache.org/jira/browse/AMQ-5537
18103	AMQ-5509	Using the code above to create a test program, I get the following reported via log4j: {noformat} 2015-01-08 15:47:38,890 INFO [com.artnaseef.RunBroker.main()] org.apache.activemq.store.SharedFileLocker - Database /tmp/amq5509/data/testAmq5509Broker/scheduler/lock is locked... waiting 10 seconds for the database to be unlocked. Reason: java.io.IOException: Failed to create directory '/tmp/amq5509/data/testAmq5509Broker/scheduler' {noformat} Is a similar message not logged, or are different results expected?	1	0	https://issues.apache.org/jira/browse/AMQ-5509
18104	AMQ-5503	Regarding failed ActiveMQ-PR-Build #20 (https://builds.apache.org/job/ActiveMQ-PR-Build/20/console): I have no idea whats going wrong here - i did not touched any of the files the job is complaining about. I did a resync by the following procedure: {code} git remote add upstream git@github.com:apache/activemq.git git fetch upstream git checkout trunk git merge upstream/trunk git push {code} What can i do?	1	1	https://issues.apache.org/jira/browse/AMQ-5503
18105	AMQ-5471	If this is just a service for hosting and serving XML files, why can't you just use an existing COTS product? Apache, for example, or one of the various products that allow you to host Maven repos? What justifies re-inventing the wheel here?	1	1	https://issues.apache.org/jira/browse/AMQ-5471
18106	AMQ-5471	If you just want to server static content, httpd, nginx are fine. If the content is more dynamic it starts to get more complicated. Sure you can map the http resource to a directory that is a git repository and then have hooks or some other external mechanism that deals with the fs content. I thought about maven repos, but I think they'd be overkill for this. If you want to use this service to provide not just configuration but also status of the brokers in the nob, in which case no cots product would help you. I don't see this as innovation in the wheel industry. Is there a simpler solution I miss?	1	1	https://issues.apache.org/jira/browse/AMQ-5471
18107	AMQ-5398	What is the impact of making the following change <broker xmlns="http://activemq.apache.org/schema/core" brokerName="localhost" dataDirectory="${activemq.base}/data" destroyApplicationContextOnStop="true"> <plugins> <discardingDLQBrokerPlugin dropAll="true" dropTemporaryTopics="true" dropTemporaryQueues="true" /> </plugins> </broker> What I really want is to put a policy whereby messages in DLQ older than 5 days are automatically deleted.	1	0	https://issues.apache.org/jira/browse/AMQ-5398
18108	AMQ-5383	Is it worth to invest that on ActiveMQ 6? there is some support required for reference countings on the server for temporary queues on the anonymous subscriptions... I'm not sure how difficult it would be to impleent that on ActiveMQ 6 (current master). Maybe it could be a result of the merging between HornetQ and ActiveMQ which we will be focusing now.	0	0	https://issues.apache.org/jira/browse/AMQ-5383
18109	AMQ-5378	I submitted the ICLA at 19/Sep/13. Is it necessary to submit a new one?	1	1	https://issues.apache.org/jira/browse/AMQ-5378
18110	AMQ-5378	Why is the service wrapper not needed anymore?	0	0	https://issues.apache.org/jira/browse/AMQ-5378
18111	AMQ-5378	Hi Marc, this still doesn't work properly on osx {code}mkdir: illegal option -- n usage: mkdir [-pv] [-m mode] directory ... INFO: Using default configuration (you can configure options in one of these file: /etc/default/activemq /Users/dejanb/.activemqrc) INFO: Invoke the following command to create a configuration file bin/activemq setup [/etc/default/activemq | /Users/dejanb/.activemqrc] INFO: Using java '/Library/Java/JavaVirtualMachines/jdk1.7.0_12.jdk/Contents/Home/bin/java' ERROR: '-n /Users/dejanb/workspace/oss/mq/assembly/target/apache-activemq-5.11-SNAPSHOT/bin/..//bin/activemq.jar' does not exist, define ACTIVEMQ_HOME in the config{code} Is there a real reason to change all that logic that deals with ACTIVEMQ_HOME? The current one works fine for years.	1	1	https://issues.apache.org/jira/browse/AMQ-5378
18112	AMQ-5378	Hi Marc, there's still problem with the proposed solution on osx. Also, I think we're adding more complexity to the already complex script, which already gave us problems in the past (as it's not easy to test it properly on all platforms). I'd like to propose a simpler solution that should still give us the desired results. It's presented in the attached patch (AMQ-5378.patch). The new file is added in the bin directory called "env" which contains default configuration. With this we have a simple file where users can tune jvm and other runtime options. This file is added to the list of files configuration files and will be executed by default. Setting up a global configuration is then just a matter of copying this file to the users folder or /etc. With this we simplify the main shell script and get the desired functionality without touching the other logic which has been stable for a while now. Also, we can maybe remove "setup" operation as it's just a matter of copying this script to the appropriate place. I haven't touch setup yet, just wanted to discuss general principle first. What do you think of this approach?	1	1	https://issues.apache.org/jira/browse/AMQ-5378
18113	AMQ-5378	Hi Dejan, thanks for spending time in the init-script infrastructure. I´m sure we are not far from a working solution. Which problems do you still experience on macosx? Can you send me the output of the problematic command? (send the file to ms-activemq@256bit.org) {code} /bin/sh -x ./activemq <the-problemtic-option> 2>&1|tee debug-the-nasty-initscript-improvement-of-marc.txt {code} It's a good idea to have default configuration in the distribution directory. I agree - that is more userfriendly. I will have a look for your patch at monday. (i tried to apply to my fork at https://github.com/breuninger-ecom/activemq, but it seems that you created it based on the original, outdated and buggy init script)	1	1	https://issues.apache.org/jira/browse/AMQ-5378
18114	AMQ-5378	BTW. Do you have a wiki account? I couldn't find it by your name.	1	1	https://issues.apache.org/jira/browse/AMQ-5378

#	Requirement	Questions	Answered	Successfully Answered	URL
18115	AMQ-5378	[~dejanb] No, i do not own a wiki account. How can i get one? (...where can i find the wiki login) Have a look at my patches - i fixed various problems i the old script: - the setup option was broken"bstat," - the "bstat" does not throw exception anymore if the broker is not running - the values of the default configuration creation were improved - it is now possible to chain various symlinks to the installation/the initscript (also classpath issues) /etc/init.d/activemq --> /opt/activemq/current/bin/activemq /opt/activemq/current/ --> /opt/activemq/apache-activemq-5.10.0/ - options like create, encrypt and decrypt are now working if the broker is not running - the help output was improved - if there is more than one defaults file, only the first one is loaded I think it would be a huge step back to restart with the inital state. I thought about the default configuration. I think we should not do this, because this renders automatic calculation of the current step to be useless. The creation of the old defaults file was broken, therefore strange if/then/else constructs were contained in the file created by the "setup" option. A working init script is a important thing for system administrators, i think it would be a good idea to get the changes upstream in a fast way. (Probably it's good idea to write a small integration test suite for the init script)	1	1	https://issues.apache.org/jira/browse/AMQ-5378
18116	AMQ-5378	Hi Marc, I cherry-picked and committed most of your changes. What I didn't commit is: - default configuration - I still think sourcing the separate script is the way to go - checkrunning changes - the commands like browse, bstat, are not limited to only working with local broker (you can use --jmxurl to connect them to remote ones), so it's not a job of a script to check if broker is running locally. We need to improve implementation of these commands, which should be done under a new Jira - changing the name of pid files - I know you mentioned multiple instances as the reason for this change. I'm not sure if you played with "create" command which should create a new "base" for multiple brokers if you want to do that. That should make those instance shell scripts also obsolete, as we can just copy "env" script to the new bin directory. I think we should focus on improving "create" functionality as the solution for multi-tenancy. - I think the test script is a great idea, but didn't include it for now, as there's a problem with it. There's general issue with using "sed -i" and "sed ~s" on osx (and probably other platforms), so we should avoid it. We should continue working on the good test script - I also removed setup command from the script. Thanks for your contribution so far. Please continue to provide fixes and improvements against the current trunk. But please, keep you patches focused on a single fix/improvement. It will make it easier to test and merge. I'll try to include some of the QA folks from RedHat to test the script on different platforms and verify it. For the future (especially for 6.x), I'd like us to get more in line of the Apollo and Karaf scripts. As for the Cygwin, as you managed to make it work, I'd leave it for now and see how to best support windows users in the future.	1	1	https://issues.apache.org/jira/browse/AMQ-5378
18117	AMQ-5344	Is there any reason why the suggested patch (https://github.com/apache/activemq/pull/45) has never been merged to trunk?	1	0	https://issues.apache.org/jira/browse/AMQ-5344
18118	AMQ-5294	Have made the necessary changes and will send a pull request. The logic that has been implemented attempts to make the configuration as minimal and sane as possible without breaking existing workflows. The logic works by deferring the sampler behaviour to client (producer/consumer) settings by default. If the client asks to send/receive messages by count, both the duration of the samplers and the ramp up/down times are ignored; this is due to the non-deterministic nature of the completion time. If the client asks send/receive messages by time, the default behaviour for a sampler is: * use the client duration as its duration, unless explicitly overridden (e.g. tpSampler.duration=15000) - then it's the user's call * set the ramp up time to 0, and the ramp down time to 0 A user may override the default behaviour by either: * setting the rampUpTime/rampDownTime - this is the highest level override * setting two new properties rampUpPercent/rampDownPercent. These properties cannot exceed 100 in total, and boundary checks are in place.	1	0	https://issues.apache.org/jira/browse/AMQ-5294
18119	AMQ-5272	Ok, I can take a stab at it when I have some spare time. Be advised that any patch will necessarily be somewhat partial, as the small solution presented here is only intended to handle our own STOMP requirement (not MQTT), will not provide documentation, and will not necessarily fit neatly into the larger conceptual/architectural framework of ActiveMQ (with which I am less than familiar). Will this be valuable? It was my hope that this example would illuminate the logic and necessity and motivate the development of a fully fleshed out first party solution along the same lines. I cannot commit to developing such a solution myself unfortunately.	0	0	https://issues.apache.org/jira/browse/AMQ-5272
18120	AMQ-5210	Is anyone working on this issue. Or anyone has idea, how to solve this issue. Due to this issue, we are not able to use to activeMQ - network broker and finally we are not able to scale it	0	0	https://issues.apache.org/jira/browse/AMQ-5210
18121	AMQ-5192	Hi [~tabish121], Thanks for your update on this one. Are we correct in thinking that this would only tell us how many times a particular job had fired? We're looking for a count of messages scheduled for each delivery, per queue. Thanks	1	0	https://issues.apache.org/jira/browse/AMQ-5192
18122	AMQ-5192	Hi Tim, What if we implemented the scheduler persistence with JDBC, would it then be possible to get the count of messages scheduled for re-delivery per queue? See AMQ-5238.	0	0	https://issues.apache.org/jira/browse/AMQ-5192
18123	AMQ-5191	And btw where in the user manual do you intended this should be added? eg can you provide a link etc?	0	0	https://issues.apache.org/jira/browse/AMQ-5191
18124	AMQ-5157	Did anyone get a chance to look at this ? Thanks, Anuj	1	0	https://issues.apache.org/jira/browse/AMQ-5157
18125	AMQ-5137	While it may make sense to have true be the default, this is a significant change. Anyone using multiple consumers distributed across a NOB in order to load-balance will find themselves with a big change between 5.9 and 5.10 as none of their cross-network consumers are sharing load from local producers. Depending on the topology, that could - in the worst case - cut down total consumption by a large amount. Especially if anyone has a topology with few local consumers... I recommend not changing the default. It's configurable. Is there a real need here?	0	0	https://issues.apache.org/jira/browse/AMQ-5137
18126	AMQ-5114	The title of this JIRA refers to AbortSlowAckConsumerStrategy, whereas the commit was in AbortSlowConsumerStrategy, so it affects both classes. When I first read the title, I assumed that the bug didn't apply to my 5.8.0 broker, since AbortSlowAckConsumerStrategy wasn't added until 5.9.0 and the Affects Version is 5.9.0. Looking at the commit, it looks like this would affect both slow consumer strategies, and that it would affect and pre-5.9.0 versions; can we update the title and Affects Version to clarify its scope, to avoid misleading future readers?	0	0	https://issues.apache.org/jira/browse/AMQ-5114

18128	AMQ-5077	some thoughts - without having looked at the particulars. for async producers - are you setting a producerWindow? that should allow pending sends to accumulate broker side. I think the root problem is ack contention for the index lock - some sort of ack batching would help there. one other thought - for composite dests - we could send to each dest in parallel - I don't think we do atm.	1	1	https://issues.apache.org/jira/browse/AMQ-5077
18129	AMQ-5077	Hi, We weren't setting a producer window before, so whatever's default was used. Have tried some quick tests now - setting abnormally high/low sizes have no effect (1k, 10k, 100k, 1mb, 10mb). Is this used if flow control is disabled? Client side, we've seen calls blocked at the network level, rather than any AMQ specific code - i think regardless of the window size, it's not been hit at the time the network call is blocked. I've been using mostly NMS clients for the testing as we'd thought the problem was initially in the NMS library - i'll get a java test set up next week and go through the code path it takes and where the time is spent waiting. I think we can either say that singular acks contending on the index lock is a problem, or that we write the messages to the index too quickly in the first place - if we just want to handle the ideal case, where consumers are able to ACK the message near-instantaneously, then we could remove the need to write the messages and then remove them in short order from the index just by delaying the writes by the roundtrip time from consumer to broker. It might reduce durability, but we've already accepted that tradeoff with other settings - so it makes sense to me to try and optimise away the index writes/contention, rather than attempt to batch up the acks, which might cause less contention but probably guarantees that the messages are written in the first place. Thanks, Richard	1	0	https://issues.apache.org/jira/browse/AMQ-5077
18130	AMQ-5077	Attached is an XML config which i think shows the issue more clearly. There is a topic with routings set up to 5 queues: TopicRouted.5.Embedded There is an embedded bean which uses a VM transport to publish from TopicRouted.5 to TopicRouted.5.Embedded If i publish to either, eventually the messages will end up on the correct queues 1-5. However, if i publish to TopicRouted.5, i'm only limited by the broker receive rate, and eventually the memory limit on the topic (~13k published/second until this point), while if i publish to TopicRouted.5.Embedded i'm limited by the speed at which the broker is able to persist messages to the queues (~3k/sec published). While i understand that this is likely to lead to message loss if the broker were to restart while the embedded router had messages pending, it would also allow us to scale a lot better with bursts of messages. Is this expected behaviour? Do you know of any way to make the broker behave like this by default? Thanks, Richard	1	0	https://issues.apache.org/jira/browse/AMQ-5077

#	Requirement	Questions	Answered	Successfully Answered	URL
18131	AMQ-5077	Leaving aside the question of message loss on failover, We have 2 goals here: - getting the maximum possible throughput to consumers - Never blocking/delaying a producer until the JMS hits an understood/visible limit (memory/diskstore). I need to come up with a better test case to see how a larger ProducerWindowSize affects this, but for the moment i don't believe it's working as we would want it to. Currently the limit on the rate which we're able to deliver messages from producers to consumers is the speed at which the JMS can write/remove messages from the index & diskstore. This happens in such a way that producers block on the send() call. org.apache.activemq.store.kahadb.KahaDBStore: public Future<Object> asyncAddQueueMessage(final ConnectionContext context, final Message message) public void removeAsyncMessage(ConnectionContext context, MessageAck ack) My reading of the code is that messages can be dispatched before the store task has completed, and if the ACK arrives before the store completes, then the store operation is cancelled. This also implies that a message could be delivered without being written to disk. I'm not sure at what point in this process the producer receives the ACK. If the consumer were quick enough to receive, process and ACK the messages in question, then we'd optimise away the need to ever write to the diskstore, and not have an issue here. However, our SAN seems to be fast enough, combined with network latency, to ensure that the disk writes are nearly always in progress before the ACK arrives. In this case, all the work to write/remove messages from the diskstore & index, and the synchronisation overheads of doing this, happen on the NIO worker threads. This delays the producers in a way that isn't visible to the producer. Whether sending messages synch or async, all the producer code sees is that calling send() takes longer. My understanding is that increasing the producer send window would allow it to keep more messages in flight before it has received ACKs for them - but would not help when it's blocked at the network level. I'll see if i can come up with a more specific test case that shows the effect of varying the producer send window. What i think we're looking for is some option along the lines of ConcurrentDispatchThenStoreIfNeeded - first dispatch the message, then wait for a timeout period, and then only persist the message to the diskstore incurring the disk/synchronisation penalties if an ACK doesn't arrive on time. This would be for a low (<100ms?) time, respect memory limits on the broker for total messages in flight, and would allow the producer send rate to scale with the slowest consumer receive speed, rather than the sum of all queue writes possible on the JMS. Current behaviour: Producer -> broker with topic -> queue routings -> consumers: - Producer is blocked by speed at which broker can write to all queues. Consumers receive messages at speed JMS can write. Queue write limit is global. Producer -> broker with embedded routing bean -> consumers (router waits for send call to complete before acking the message received): - Producer is able to write up to producer window size. Embedded bean is blocked by broker write speed - consumers receive messages at speed JMS can write. Queue write limit is global. Ideal situation: Producer -> broker with topic -> queue routings and ConcurrentDispatchThenStoreIfNeeded set: Producer is able to write up to producer window size. Broker is able to dispatch to consumers at consumer receive rate limit, only writing to disk if consumers slow down. Does that make sense, or do you think i'm misunderstanding the issue here? Thanks, Richard	1	0	https://issues.apache.org/jira/browse/AMQ-5077
18132	AMQ-5077	producer catch it in code like: {noformat} "main" prio=10 tid=0x000000000bc3b000 nid=0x4109 runnable [0x0000000041ebe000] java.lang.Thread.State: RUNNABLE at java.net.SocketOutputStream.socketWrite0(Native Method) at java.net.SocketOutputStream.socketWrite(SocketOutputStream.java:113) at java.net.SocketOutputStream.write(SocketOutputStream.java:159) at org.apache.activemq.transport.tcp.TcpBufferedOutputStream.flush(TcpBufferedOutputStream.java:115) at java.io.DataOutputStream.flush(DataOutputStream.java:123) at org.apache.activemq.transport.tcp.TcpTransport.oneway(TcpTransport.java:176) at org.apache.activemq.transport.AbstractInactivityMonitor.doOnewaySend(AbstractInactivityMonitor.java:304) at org.apache.activemq.transport.AbstractInactivityMonitor.oneway(AbstractInactivityMonitor.java:286) at org.apache.activemq.transport.TransportFilter.oneway(TransportFilter.java:85) at org.apache.activemq.transport.WireFormatNegotiator.oneway(WireFormatNegotiator.java:104) at org.apache.activemq.transport.failover.FailoverTransport.oneway(FailoverTransport.java:658) - locked <0x000000050f60c5e8> (a java.lang.Object) at org.apache.activemq.transport.MutexTransport.oneway(MutexTransport.java:68) at org.apache.activemq.transport.ResponseCorrelator.oneway(ResponseCorrelator.java:60) at org.apache.activemq.ActiveMQConnection.doAsyncSendPacket(ActiveMQConnection.java:1321) at org.apache.activemq.ActiveMQConnection.asyncSendPacket(ActiveMQConnection.java:1315) at org.apache.activemq.ActiveMQSession.send(ActiveMQSession.java:1853) - locked <0x000000050f60c668> (a java.lang.Object) at org.apache.activemq.ActiveMQMessageProducer.send(ActiveMQMessageProducer.java:289) at org.apache.activemq.ActiveMQMessageProducer.send(ActiveMQMessageProducer.java:224) at org.apache.activemq.ActiveMQMessageProducerSupport.send(ActiveMQMessageProducerSupport.java:269) {noformat} My understanding of flow control & the producer window size: Client side: - window size is set. - Before each send, current size of all messages in flight is checked to see if window is exceeded. - if producerWindow.waitForSpace() doesn't block, then the message is sent. - After the message is sent, the producer in flight size is incremented by the message size (and decremented when the ack is received). Broker side: - Each queue has a memory limit set, as well as overall memory limit and disk store limit. - For each message dispatched for a given queue, each of these limits is checked. - if any limit is set and sendFailIfNoSpace is set to true, the producer should get an exception sent back. In none of my tests have i caught any thread stuck inside the flow control handling logic. In all cases they're inside network code - producer side as above, broker side in something like: {noformat} "ActiveMQ NIO Worker 29" daemon prio=10 tid=0x000000001775d000 nid=0x6a0d runnable [0x000000004473d000] java.lang.Thread.State: WAITING (parking) at sun.misc.Unsafe.park(Native Method) - parking to wait for <0x0000000638b62430> (a org.apache.activemq.store.kahadb.KahaDBStore$StoreQueueTask$InnerFutureTask) at java.util.concurrent.locks.LockSupport.park(LockSupport.java:186) at java.util.concurrent.FutureTask.awaitDone(FutureTask.java:425) at java.util.concurrent.FutureTask.get(FutureTask.java:187) at	1	0	https://issues.apache.org/jira/browse/AMQ-5077

18133	AMQ-5077	Hi, I'm happy that those 2 changes would help the producer in not getting blocked by the JMS. It is also likely to improve throughput to the consumers, but i think we could make further improvements there. A new executor using Concurrent store and dispatch is likely to result in more messages in flight to the consumers - but i'm still concerned that the performance of this (this being the ultimate queue writes/sec the broker can achieve) will be hard to determine, as it will be a function of how quick the underlying disk store is as well as the average roundtrip time for the consumer to receive, process and ACK each message. If we have a large queue of messages being written to the diskstore, and relatively quick consumers, then we can optimise away the disk writes - but i'm not sure that this is visible at the moment. I would still be interested in i guess some form of delay queue for the diskstore writes - a configurable property for a minimum delay to wait before writing messages through to the index/diskstore, which you could benchmark against your expected consumer ACK roundtrip time to determine if you expect to be able to optimise away the disk writes completely under most situations. If this delay is small enough, and the producer window doesn't get decremented till either the diskstore write completes or the consumer ACK arrives, we could still have some resilience against message loss with this in place. Do you think that would be a useful option, or cause more problems than it could solve? Thanks, Richard	1	0	https://issues.apache.org/jira/browse/AMQ-5077
18134	AMQ-5030	Is there any reason why Camel cannot be upgraded to 2.13.1 instead of 2.12x?	0	0	https://issues.apache.org/jira/browse/AMQ-5030

18136	AMQ-5009	i updated the release page - the point of the single -all jar is just ease of use. But there is a maven ease of use and ease of exclusion use case for sure - maybe we can have both the -all.pom and the artifact. Is that possible?	0	0	https://issues.apache.org/jira/browse/AMQ-5009
18137	AMQ-5008	Hi. Why there is no feedback here? It is very important feature for "security freaks". Patch needs additional work as it uses label jumps (technique known from such languages like BASIC known from 1960s). But with a little tuning and some unit test it might be very useful and a kind of green light for "security freaks"- most often financial sector like banks. Of course once this functionality will be done, there will be a problem of knowing that certificated used to establish connection was compromised. So once established using not yet compromised certificate, client app can still work as long as will not disconnect. But this is second side of the problem. Greetings Piotr Klimczak	1	0	https://issues.apache.org/jira/browse/AMQ-5008
18138	AMQ-4940	Before I start any work -- would a patch for this (upgrading Jetty to the latest stable release) be welcomed? I just don't want to waste my time if it's something that isn't desired.	1	1	https://issues.apache.org/jira/browse/AMQ-4940
18139	AMQ-4940	Steve, how far did you get with this? I think the old version of jetty is causing issues with java 8 so was interested in trying a patch. Just found AMQ-5517 adding support for Jetty 9.	1	0	https://issues.apache.org/jira/browse/AMQ-4940
18140	AMQ-4903	Does this work with Karaf 2.x also?	1	1	https://issues.apache.org/jira/browse/AMQ-4903
18141	AMQ-4888	I guess since you turn off persistence you assume the broker is memory only? Yeah maybe the disk check should not happen if its not persistent? Not sure if we have improved this in 5.9? Can you try with that release?	0	0	https://issues.apache.org/jira/browse/AMQ-4888
18142	AMQ-4888	Well, it's more that it issues an ERROR, but then somehow works anyway (should that message rather be a WARN?). And perhaps the default size of 50GB is a bit high. I understand temp space may be used for swapping messages, perhaps I need to use VM cursor to avoid potential disk use. I also realize that when creating a Broker just with new BrokerService(), I have no idea how its default configuration looks like.	0	0	https://issues.apache.org/jira/browse/AMQ-4888
18143	AMQ-4885	Agreed. Fernando, can you clean up the patch? not sure how the package.html patches are necessary for this jira... as well as the binary diffs on the .class files...	0	0	https://issues.apache.org/jira/browse/AMQ-4885
18144	AMQ-4867	I am also using Master/Slave configuration for ActiveMQ broker and faced the similar issue. Is there a way to initialize the plugin for failover broker ?	0	0	https://issues.apache.org/jira/browse/AMQ-4867

#	Requirement	Questions	Answered	Successfully Answered	URL
18145	AMQ-4867	what is this plugin doing? A slave broker blocks on creating the persistence adapter which is typically locked by the master. When the persistence adapter starts then it starts the broker, pluigns and transport/network connectors. The idea is that a client can only connect to a broker when it is started and has exclusive access to the store. So any plugin will not be able to do much b/c the broker can't do much. You could init your plugin as a spring bean and have it created when the context is loaded but maybe a plugin is not the way to go. Please provide some more context on what you are trying to achieve and why two instances of your plugin logic need to coexist.	1	0	https://issues.apache.org/jira/browse/AMQ-4867
18146	AMQ-4867	Can you wire the monitoring heartbeats to a JMX operation? JMX mbean server is started before we start the persistence adapter so you can query the brokerView Mbean. The isSlave attribute will reflect the current state of the failover broker.	1	0	https://issues.apache.org/jira/browse/AMQ-4867
18147	AMQ-4848	GitHub user zmhassan opened a pull request: https://github.com/apache/activemq/pull/28 https://issues.apache.org/jira/browse/AMQ-4848 - added NetworkConnectors... Fixed activemq:list command and it now displays the following output in karaf: ```javascript JBossA-MQ:karaf@root> activemq:list TransportConnectors = {openwire=tcp://localhost:38009?maximumConnections=1000} BrokerName = amq-broker TransportConnectors = {openwire=tcp://localhost:61616?maximumConnections=1000} BrokerName = amq ``` You can merge this pull request into a Git repository by running: $ git pull https://github.com/zmhassan/activemq AMQ4848 Alternatively you can review and apply these changes as the patch at: https://github.com/apache/activemq/pull/28.patch To close this pull request, make a commit to your master/trunk branch with (at least) the following in the commit message: This closes #28 ---- commit 40b1909256522ccccbcf6e3547eae48039d097f7 Author: zmhassan <zak.hassan1010@gmail.com> Date: 2014-06-17T20:24:43Z https://issues.apache.org/jira/browse/AMQ-4848 - added NetworkConnectors to activemq:list command ----	1	1	https://issues.apache.org/jira/browse/AMQ-4848
18148	AMQ-4848	GitHub user zmhassan opened a pull request: https://github.com/apache/activemq/pull/59 https://issues.apache.org/jira/browse/AMQ-4848 - Karaf update added Netw... This was a fix that I sent pull request #28 which was from Jun 17, 2014. I fixed activemq:list command and it now displays the network connectors available for the broker on karaf. Can anyone review this patch. If the fix is good then can this be merged? ![screen shot 2015-02-11 at 4 14 05 pm 2](https://cloud.githubusercontent.com/assets/1269759/6156952/a8b3eae2-b20b-11e4-8cd1-7ae9bca809d0.png) Also I've updated the pax exam unit test so the integration test does not fail. ![screen shot 2015-02-11 at 4 26 39 pm 2](https://cloud.githubusercontent.com/assets/1269759/6156968/cfaef740-b20b-11e4-9dd7-1fe04a2e84b9.png) You can merge this pull request into a Git repository by running: $ git pull https://github.com/zmhassan/activemq AMQ-4848-master Alternatively you can review and apply these changes as the patch at: https://github.com/apache/activemq/pull/59.patch To close this pull request, make a commit to your master/trunk branch with (at least) the following in the commit message: This closes #59 ---- commit 669f6078bf3c7d25ea346917e70913ca6472c06b Author: zmhassan <zak.hassan1010@gmail.com> Date: 2015-02-11T21:31:44Z https://issues.apache.org/jira/browse/AMQ-4848 - Karaf update added NetworkConnectors to activemq:list command ----	1	1	https://issues.apache.org/jira/browse/AMQ-4848
18149	AMQ-4831	I think the current implementation is ok. I agree that on the presentation part it would be the job of the console to display something appropriate and aesthetically pleasing. The mbean should supply an accurate value as it may be used by machines as well, not only human consumption. As far as jconsole goes, it presents the raw data it gets as expected. I'd suggest closing this as a won't fix, or move it to need-review. wdyt?	0	0	https://issues.apache.org/jira/browse/AMQ-4831
18150	AMQ-4831	Typically, I like to see formatting handled entirely on the UI front, and that applies here. Also, the display looks acceptable to me. With that said, tracking average message size as a real number seems excessive. Even for very small message sizes (say 1-10 bytes), it doesn't seem to add much value (would you monitor and have a threshold at 1.5 bytes?). So, changing it to an integer or long seems viable.	1	0	https://issues.apache.org/jira/browse/AMQ-4831
18151	AMQ-4825	Why should there be OpenShift/Fuse-specific logic in the ActiveMQ code? Why not use AMQ_PORT environment variable?	0	0	https://issues.apache.org/jira/browse/AMQ-4825
18152	AMQ-4819	Sounds good Matt, do you wanna take a stab at implementing this?	0	0	https://issues.apache.org/jira/browse/AMQ-4819
18153	AMQ-4819	Sure thing. I'll work up a patch in the next day or so. Can you check out my patch for AMQ-4818? I want to make sure I'm going through the motions properly. Thanks	1	1	https://issues.apache.org/jira/browse/AMQ-4819
18154	AMQ-4818	Yeah, its just add'l fields to existing attributes, but a unit test is always a good idea. I'll look to extend/add. Are the unit tests for the 'master' branch out of Git building for you? I'm getting errors.	1	0	https://issues.apache.org/jira/browse/AMQ-4818

18156	AMQ-4759	We need an OSGi bundle for it. Currently 1.4.4 is the last version we have http://repo2.maven.org/maven2/org/apache/servicemix/bundles/org.apache.servicemix.bundles.xstream/	1	1	https://issues.apache.org/jira/browse/AMQ-4759
18157	AMQ-4738	@Deven - have a peek at https://issues.apache.org/jira/browse/AMQ-4682 - which allows runtime mods to the xml configuration. does that meet your use case?	1	1	https://issues.apache.org/jira/browse/AMQ-4738
18158	AMQ-4701	Hi, I am also facing a similar problem. The number of threads are not decreasing after using NIO transport. Can somebody tell in what scenarios this kind problem occurs? Thanks, Sam	1	0	https://issues.apache.org/jira/browse/AMQ-4701
18159	AMQ-4701	I have provided my configuration and test results. Can someone from ActiveMQ developers team help me with this. As Timothy said it reduces clients for large number of clients, So can you please specify what should be this large value. I have tried with 20 clients. After how many clients nio starts reducing threads ? Thanks, Anuj	1	0	https://issues.apache.org/jira/browse/AMQ-4701
18160	AMQ-4694	JNA appears to be (at least based on what distribution says) dual licensed under LGPL and ASL from version 4.0.0 onward. Does Apache preclude the use of open source work that isn't exclusively ASL? The version of JNA referenced in the patch is 3.5.1, but version 4.0 could be used instead.	1	1	https://issues.apache.org/jira/browse/AMQ-4694
18161	AMQ-4693	Hi ActiveMQ team, Could you please let me know if there is a plan to add GSS API based Kerberos Authentication to ActiveMQ TCP/STOMP connectors anytime soon. Could you please also provide rough estimate on timelines/version when this will be available? We use ActiveMQ and would like to expand its usage to authenticated message exchanges. Unfortunately, the simple text based user/password authentication supported currently by ActiveMQ will not be enough for our use cases and we want to use single sign on based authentication. Thanks!!	1	0	https://issues.apache.org/jira/browse/AMQ-4693
18162	AMQ-4693	Hi Timothy, Thanks for the quick response. Can you please atleast tell me what are the rough timelines when ActiveMQ team could take this up? Would this be available in ActiveMQ-6.0 over next few months or is this too far away? Since Apache Qpid already supports Kerberos, I was thinking that code from Qpid can be ported to ActiveMQ without much effort? Is this too much of work? Are there any challenges in implementing kerberos for activemq? I see various ppl are interested in this in various communities. Thanks, Sam	1	1	https://issues.apache.org/jira/browse/AMQ-4693
18163	AMQ-4693	Also, how do you suggest somebody implement Kerberos support in ActiveMQ? Can it be done via ActiveMQ plugins? Since a user writing plugin does not have handle of the actual socket/connection, it may be difficult to add kerberos protocol/support via a broker plugin. Even if socket is accessible from broker plugin, activemq will use the socket for its own communication protocol and user will not be able to superimpose kerberos protocol on top of that connection stream parallely. Also, its not clear how will server authenticate itself to the user in such cases. I think kerberos authentication support will have to be inbuilt in activemq and cannot be done via plugins. This is the main problem due to which i cannot implement kerberos via plugin unless this is added into core activemq code. Thanks, Sam	1	1	https://issues.apache.org/jira/browse/AMQ-4693
18164	AMQ-4693	Thanks for the pointer. The problem is how does an ActiveMQ client (both JMS/STOMP) pass kerberos credentials to the ActiveMQ broker. I don't see any customized headers/fields in the connect/handshake call that clients can use to pass the kerberos credential/token. Clients also don't have access to the socket created by ActiveMQ library, so kerberos credentials cannot be written directly on the socket. Also, since ActiveMQ has its connect/handshake own protocol and message formats, how would client's kerberos credentials be passed to broker while activemq is doing its down protocol -- this seems complicated to overlap the two. Also the other way around, how would the broker authenticate itself to the clients? -Sam	1	1	https://issues.apache.org/jira/browse/AMQ-4693
18165	AMQ-4693	Hi Timothy, Please give the rough timelines when can we expect kerberos authentication in ActiveMQ. I can see many people are interested in this issue and actually if kerberos authentication can be added into the next coming version, it will be a great help. And as Sam suggested that Qpid already supports Kerberos, it won't be much overhead to port the code into ActiveMQ. Thanks, Anuj	1	0	https://issues.apache.org/jira/browse/AMQ-4693

#	Requirement	Questions	Answered	Successfully Answered	URL
18166	AMQ-4693	Let's step back a moment. In order to support modern authentication methods such as Kerberos, you need the capability for the client and server to exchange an arbitrary number of messages at the beginning of a session in order to set up a security context. That performs authentication, and provides a context which the peers can use protect subsequent messages. Is there a way in ActiveMQ whereby we can plug in to do this? It's been suggested to me that there is not.	1	0	https://issues.apache.org/jira/browse/AMQ-4693
18167	AMQ-4693	Hi, As per my understanding, in order to add Kerberos authentication for ActiveMQ client and broker to mutually authenticate themselves to each other (using Kerberos or GSS API), we need to have a common channel using which client and broker could arbitrarily exchange some messages (tokens) before the GSS Security Context is established. Only after two way exchange of messages (tokens) over a common channel, the client and broker can authenticate themselves to each other. However, in order to exchange such messages initially, we would need common channel for client/broker to communicate. With the current plugin/interceptor support provided in ActiveMQ, there is no way for client and server to mutually exchange some messages before they are considered authenticated to each other. I only see one way passing of user name and password from client to broker which isn't sufficient to establish GSS security context and mutual authentication. It looks like there has to be some additional mechanism for doing this two way authentication (and exchange of tokens) before any other other communication can take place. So, it does not look like we can add kerberos based authentication to activemq with the current plugin support. Could ActiveMQ developers please confirm my understanding here? Thanks, Deepak	1	0	https://issues.apache.org/jira/browse/AMQ-4693
18168	AMQ-4693	Interesting discussion! I agree that without a mechanism for mutual exchange of messages initially, GSS security context cannot be eastablished and kerberos authentication cannot take place. Could the ActiveMQ developer team comment on Deepak's and Richard's queries and confirm kerberos authentication cannot be added with the currently available plugin support? I guess all of us are stuck unless these queries are answered. Thanks, Sam	1	1	https://issues.apache.org/jira/browse/AMQ-4693
18169	AMQ-4693	Alright folks ! So can we conclude that adding a security plugin to do kerberos based authentication is NOT an option here? Tim, Christian -- Can we broaden the scope here and try add an SASL framework? The out-of-the-box implementation should provide GSSAPI based kerberos authentication and others like BASIC, PLAIN, DIGEST, MD5 could be added later. I understand that most ActiveMQ devs are too occupied in other stuff but I think its time that ActiveMQ be made more secure & robust in this regard since some of the other MQ products already support these things.	0	0	https://issues.apache.org/jira/browse/AMQ-4693
18170	AMQ-4693	Can somebody from ActiveMQ developer team confirm my understanding in the previous update ? Thanks, Anuj	1	0	https://issues.apache.org/jira/browse/AMQ-4693
18171	AMQ-4693	Hi Gary, ActiveMQ team, Now that ActiveMQ-5.9 is out, I just wanted to check and confirm that Kerberos/SASL based authentication is really being planned for the next ActiveMQ release (v 5.10). This will be tremendously helpful. Could you please provide a rough timeframe on when this feature will be available? Thanks, Deepak	1	0	https://issues.apache.org/jira/browse/AMQ-4693
18172	AMQ-4693	Hi Gary, Did you get a chance to look at my previous post? Could you or somebody else from ActiveMQ team please provide a rough timeline if possible? Thanks a ton!! -Deepak	1	0	https://issues.apache.org/jira/browse/AMQ-4693
18173	AMQ-4693	We are also eagerly awaiting this feature. This will really take ActiveMQ's usage and use cases to next level and will be useful for many people in the community and industry. Can ActiveMQ developers please prioritize this feature since this seems like basic stuff which should be supported? =John=	1	1	https://issues.apache.org/jira/browse/AMQ-4693
18174	AMQ-4693	What's the status on this based on the current voting? Can somebody from the ActiveMQ team please respond to this? Can we assume this is definitely a part of ActiveMQ-5.10? Given that Apache products like Qpid support kerberos based authentication, this shouldn't be too hard to add, no? Note that SASL based authentication should work for Openwire as well as STOMP. -steve	0	0	https://issues.apache.org/jira/browse/AMQ-4693
18175	AMQ-4693	Hi Gary, Now that we are past January, is there any plan to look at this sometime soon? Thanks! -Deepak	1	0	https://issues.apache.org/jira/browse/AMQ-4693
18176	AMQ-4693	Gary, ActiveMQ Gods, When do we plan to start on this? Please let us know if this is on track for ActiveMQ-5.10 release. Could you please provide a rough timeline on when this feature could be available. That will be really helpful! Thanks! -Deepak	1	0	https://issues.apache.org/jira/browse/AMQ-4693
18177	AMQ-4693	I agree that this may be a significant work to implement. However since several people have expressed interest in this feature and the benefits of adding this feature would also be significantly high, can we atleast get a rough timeline on when ActiveMQ experts/developers may start looking at this? I think this feature would take ActiveMQ's usage in the industry to the next level and make it useful in a bunch of scenarios where it currently cannot be used due to lack of strong security mechanisms. Since this was/is originally marked for ActiveMQ-5.10 release, can we still assume that this will be available in ActiveMQ-5.10? Are you implying that this feature will not be available in ActiveMQ-5.10 at all? Getting some clarity on timeline would atleast help a lot of people to make proper choice of message queue implementation that they want to use in their projects. Many Thanks! -Deepak	1	0	https://issues.apache.org/jira/browse/AMQ-4693
18178	AMQ-4693	Hi ActiveMQ team, Did you get a chance to look at this? Could you please provide a rough timeline for this based on current priorities and project pipeline? Can this be taken up sometime soon given that this will be useful for a lot of use cases in general and will take ActiveMQ usage to the next level? Thanks, Deepak	1	0	https://issues.apache.org/jira/browse/AMQ-4693
18179	AMQ-4693	Hi Ryan! Thanks for feedback! As this solution is built on top of RFC2712, it is using TCP and SSL protocol with Kerberos tokens handshake. As failover works for plain SSL, then it should work for Kerberos too I believe. I have performed some tests: 1. Amended org.apache.activemq.network.NetworkFailoverTest to use krb5 protocol instead of tcp- PASSING 2. Crafted my own test with broker1 is starting, connecting 3 consumers with failover protocol, broker1 stopping, starting broker2, sending 3 messagaes. As a result consumers are reconnecting from broker1 to broker2 and consuming messages properly. Do you remember what exactly failed in your scenario? Haven't tested it yet on 2 different machines. Do you remember whether your problem occurs when testing failover on one machine? What I haven't tested yet is token expiration and renewal, which might cause the problem you described above. Will try to test it soon and will be back with results. I am not keen in Kerberos, so any help is welcome :) Thanks in advance for feedback. Piotr Klimczak	1	1	https://issues.apache.org/jira/browse/AMQ-4693
18180	AMQ-4693	Hi Piotr, Really excited to see this getting implemented! Is this new feature scheduled for the upcoming 5.11 release? Thanks, Deepak	1	0	https://issues.apache.org/jira/browse/AMQ-4693
18181	AMQ-4693	[~nannou9] I was inspired by ur PR to implement same in artemis - https://issues.apache.org/jira/browse/ARTEMIS-1264 however it appears the solution is in a bit of a java bubble and maybe a time warp. One I peeked out of the java realm I found the OpenSSL discussions and noted the evolution from RFC2712. It *is* too good to be true that any TLS client can get kerberos authentication for free. It comes at the cost of having an insecure channel. The use case is Kerberos SSO over an insecure channel, have you found that useful in practice?	1	1	https://issues.apache.org/jira/browse/AMQ-4693

#	Requirement	Questions	Answered	Successfully Answered	URL
18182	AMQ-4693	Hi [~gtully]. When I was looking for possible solutions, I have studied some other projects and also got inspired by one of Apache project which had it already implemented (don't remember which one unfortunately). My assumption was that if this solution was already once accepted by apache committers to the other project, then it should be good enough for ActiveMQ too, but indeed it looks like things moved on since then. At this point of time (late 2014), I have found that RFC2712 was the simplest implementation for this JIRA as other approaches required quite a lot of work as per comments made by others. Haven't used it anywhere in any project, as did it purely for community and self learning of kerberos. Kind regards	1	1	https://issues.apache.org/jira/browse/AMQ-4693
18183	AMQ-4693	[~gtully] As RFC2712 (in fact JSSE) is now past, the only options we have as I understand is GSS API. Question now- plain GSS or via SASL? C world will rather uses SASL if we are looking for C libs compatibility. Also, while JSSE came at almost no extra cost as it was over SSL, GSS/SASL are bit more difficult to implement (but definitely doable) as it requires sending tokens over stream pipe, instead of just stream. Surprisingly NIOSSLTransport doesn't seem to be far away from what GSS needs, as it also does (un)wrapping, handshaking etc but over SSL. So implementing GSS might not be that tricky as I initially thought, but I might be missing sth as I haven't been doing anything for ActiveMQ for last 2.5 years- bad :(I know. WDYT? Does it make sense? Personally I would love to implement it. Just not sure if my RL work will allow me as I am spending a lot of time in overtime in last months. Might give it a go during the weekend. Unless all hands should now go to Artemis? Cheers.	1	1	https://issues.apache.org/jira/browse/AMQ-4693
18184	AMQ-4679	Hi Mr. Timoty Bish! Thanks for your reply. It allowed me to move forward a bit. The download of ActiveMQ moved forward significantly. But there is another problem. The download stopped a one transitive dependency artifact: org.apache.qpid:proton-jms:jar:0.3.0-fuse-2 I searched for this artifact in the repository search engine and there is a difference between the version ActiveMQ is using and the one in the Maven repository. Look org.apache.qpid:proton-jms:jar:0.3.0-fuse-2 org.apache.qpid:proton-jms:jar:0.3 Do you see the difference? Here is my full error display > Downloading org.apache.qpid:proton-jms:pom:0.3.0-fuse-2 > Building SomeLocalApplication > Downloading org.apache.qpid:proton-jms:jar:0.3.0-fuse-2 > Buildr aborted! > RuntimeError : Failed to download org.apache.qpid:proton-jms:jar:0.3.0-fuse-2, tried the following repositories: > http://repo1.maven.org/maven2/ > https://repository.apache.org/content/repositories/snapshots/ Can you find a solution to this discrepancy? I suspect that you might have to update library org.apache.qpid:proton-jms:jar:0.3.0-fuse-2 to the most current one available. Also, I strongly suggest that you test the full download of ActiveMQ with the coordinate you give on your website. You might have to delete your own local Maven to do a full test.	1	0	https://issues.apache.org/jira/browse/AMQ-4679
18185	AMQ-4652	Since Java 8 is out now and ActiveMQ is still built with Java 7. When can we expect ActiveMQ compiled with java 8 ? Thanks, Anuj	1	0	https://issues.apache.org/jira/browse/AMQ-4652
18186	AMQ-4644	Can you find the valid SQL That informix can use? It is possible to define custom SQL configurations for different database vendors. So we can have an informix, but would need to valid SQL to use.	0	0	https://issues.apache.org/jira/browse/AMQ-4644
18187	AMQ-4621	I managed to fix the xml configuration issue, however this case still fails with the new strategy. Are you able to provide any insight into why this is still failing? Note this the same test case as on AMQ-4533.	1	1	https://issues.apache.org/jira/browse/AMQ-4621
18188	AMQ-4621	Should we reopen this issue? Tim mentioned to me via email he made some adjustments to the fix for this issue, but I can't find them in the Apache ActiveMQ repo, git://git.apache.org/activemq.git.	1	1	https://issues.apache.org/jira/browse/AMQ-4621
18189	AMQ-4594	I just followed Christian's instructions on his blog post http://www.christianposta.com/blog/?p=315 using the latest 5.9-SNAPSHOT https://repository.apache.org/content/groups/snapshots/org/apache/activemq/apache-activemq/5.9-SNAPSHOT/ and it seems hawtio is correctly included; so I guess this issue is almost closed ;). Though its worth leaving open until just before the release; so we can ensure we upgrade to the latest hawtio release. (e.g. 1.2 GA should be out by then).	0	0	https://issues.apache.org/jira/browse/AMQ-4594
18190	AMQ-4594	I'm building from source (commit 3e58a5a4ebd4d311f6d82065f602ace911318038), using maven 3.05 and encountering this same exception. Is there a workaround for the time being to be able to demo hawtio to co-workers?	1	0	https://issues.apache.org/jira/browse/AMQ-4594
18191	AMQ-4567	I suppose the original idea was for read/write access to JMX to be a admin-priviledged function... Should we enhance that to enforce authn authz at the jmx level with the thought users might be using JMX?	1	0	https://issues.apache.org/jira/browse/AMQ-4567
18192	AMQ-4565	Is this problem related to or even the same as AMQ-4356?	1	0	https://issues.apache.org/jira/browse/AMQ-4565
18193	AMQ-4553	Attached first attempt... Gary/Tim, can you review?	1	1	https://issues.apache.org/jira/browse/AMQ-4553
18194	AMQ-4552	Hi Claus, do you mind if I assign to me and work on this Jira ?	1	0	https://issues.apache.org/jira/browse/AMQ-4552
18195	AMQ-4492	Hello [~chris@die-schneider.net],[~jbonofre], I have been seeing all the messages in the Karaf dev list about Karaf 3 so I am getting all excited (Karaf 3 started to make me think of "Waiting For Godot"...:)). I see that activemq 5.9 is soon to come out so I would like to upgrade to that as well. My apologies if I am not understanding here - What exactly is the problem? I can happily run activemq 5.8.0 without Karaf (in an eclipse workspace with bndtools - equinox + gogo)...though I don't have access to the activemq commands (which are Karaf specific). Why should Karaf 3.0.0 cause a problem with gogo package bindings? Surely Karaf should export the same gogo packages as native felix gogo does? If it doesn't won't it break other OSGi features that may use gogo? I would hate activemq 5.9.0 not to be able to work in Karaf 3.0.0. just because of the Karaf command-line (especially since it will likely be months for 5.10.0). The command-line commands, are not essential, are they (I don't require them to run activemq 5.8.0 with just equinox and gogo)?	0	0	https://issues.apache.org/jira/browse/AMQ-4492
18196	AMQ-4492	What is the status of this? Is there a new Karaf release such as 3.0.1 that helps or is there some work needed on ActiveMQ side?	1	0	https://issues.apache.org/jira/browse/AMQ-4492
18197	AMQ-4433	Here's a new patch (with tests!) that addresses some of the missing validation: https://github.com/qerub/activemq/commit/22776a2960231305674c70e795daec80db02ab69 https://github.com/qerub/activemq/commit/22776a2960231305674c70e795daec80db02ab69.patch What do you think? (I've forgotten exactly which cases were too hard to validate, but it includes the transport.* sub-parameters.)	1	0	https://issues.apache.org/jira/browse/AMQ-4433
18198	AMQ-4399	Is there more to this ticket? Or can it be closed?	1	1	https://issues.apache.org/jira/browse/AMQ-4399
18199	AMQ-4374	I'm guessing since ActiveMQ already has this feature that you don't want us to add it again as that would be redundant, and it'd be redundant too. Is this for Apollo?	1	0	https://issues.apache.org/jira/browse/AMQ-4374
18200	AMQ-4365	My understanding is that when using multiple kahaDB (mKahaDB) persistence adpaters, we only need one lease-database-locker for all the adapters, right? The xsd requires that we define one for each kahaDB. Does it mean we end up with multiple locker-threads checking and/or updating the lock-table? How does it work with mKahaDB really?	1	0	https://issues.apache.org/jira/browse/AMQ-4365

#	Requirement	Questions	Answered	Successfully Answered	URL
18201	AMQ-4365	Thanks Gary. So you mean that at the moment we better not to use the Paul's lease-locker implementation if we're using mKahaDB? Well right now we are in a kind of no-lock-no-luck situation, meaning that we couldn't make the master/slave setup to work with (m)kahaDB for one of our customers, because of the filesystem used (they're not using NFSv4 as recommended). Perhaps we need to reconsider using mKahaDB and getting back to a single kahaDB with amq-db-lease-locker. Is there any plan from your side to come up with a solution in the next release?	1	0	https://issues.apache.org/jira/browse/AMQ-4365
18202	AMQ-4365	With this change in place does the broker handle the two scenarios where the database is either offline at start-up or goes offline at at some point after start-up? If so, how? If not, what modifications are needed for the broker to cope with these scenarios? I am trying to get an idea for the nature and magnitude of any required changes. Ideally the broker should attempt to (re)connect indefinitely in both scenarios.	1	0	https://issues.apache.org/jira/browse/AMQ-4365
18203	AMQ-4358	Matt, for "time" are you looking for a timestamp or the amount of time in ms? FirstEnqueueTime = amount of time it took to do the first enqueue since the broker has been up, LastEnqueueTime = amount of time it took to do the last enqueue that the destination knows about? etc..	1	0	https://issues.apache.org/jira/browse/AMQ-4358
18204	AMQ-4354	Which statistics are you referring to?	1	1	https://issues.apache.org/jira/browse/AMQ-4354
18205	AMQ-4354	All the stats for non-transitive objects under org.apache.activemq. Broker stats, destination stats, transport/network connector stats, etc.. (connection stats wouldn't make any sense b/c they are transitive). Not persisting statistics results in weird scenarios where after a restart you have "4,232" pending messages, but "0" enqueued messages. Admins could then rely on "resetStatistics" to clear them, instead of a broker restart	0	0	https://issues.apache.org/jira/browse/AMQ-4354
18206	AMQ-4341	Attaching a patch that: i) removes dependency flag from xbean-spring ii) removes depedenct flag from jms spec iii) removes reference to the activemq-http bundle (since its part of the uberbundle) iv) Creates a new integration test that tests the installation of the activemq broker feature against obr.	1	0	https://issues.apache.org/jira/browse/AMQ-4341
18207	AMQ-4341	Instead of removing the dependency flags from xbean-spring and the JMS specification, wouldn't it be better to ensure the activemq-osgi bundle imports those required packages? That would trigger the installation of those bundles too, but it would also avoid installing a second version of xbean-spring if a suitable one is already available.	1	0	https://issues.apache.org/jira/browse/AMQ-4341
18208	AMQ-4341	@loannis, this looks great. thanks for the patch. Peeking at org.apache.activemq.karaf.itest.ObrFeatureTest#testBroker that is disabled, any idea why that gets a clash of ports on 8181? on spring-dm in the activemq feature. Do u recall why that is required?	1	1	https://issues.apache.org/jira/browse/AMQ-4341
18209	AMQ-4341	Is this import version range correct? > + org.springframework.osgi*;version="[3,4]";resolution:=optional, I would assume spring osgi is version 1.2.1 being used. So it should be org.springframework.osgi*;version="[1.2,1.3)";resolution:=optional, And there is imports of sun packages + sun.misc*;resolution:=optional, + sun.nio*;resolution:=optional, Is that correct?	1	0	https://issues.apache.org/jira/browse/AMQ-4341
18210	AMQ-4341	@Claus, I think that you are right about the org.springframework.osgi version range. The sun packages are needed since some of the internal packages in the activemq-osgi make use of it. @Gary, its pretty safe to enable the test. Regarding the spring-dm feature, maybe we could get rid of it (we have the imports optional anyway). I think that the only case where its acutally needed is activemq-camel, which again is optional. Does this make sesne?	0	0	https://issues.apache.org/jira/browse/AMQ-4341
18211	AMQ-4311	What store are you assuming for this? Kahadb? Jdbc? Memory? Can you put together a test that shows PFC won't block? message size for pending messages in a tx should be counted against memory usage... any time we do a message.incrementReferenceCount(), the usage memory will be updated (if it's the first reference). In org.apache.activemq.broker.region.Queue#doMessageSend we check if transaction (context.isInTransaction) and then we do message.incrementReferenceCount()... In org.apache.activemq.broker.region.Topic#doMessageSend we increment the reference regardless of whether it's in a tx. You might be on to something, but can you give more details?	1	0	https://issues.apache.org/jira/browse/AMQ-4311
18212	AMQ-4305	When testing this - can i use activemq-rar-5.9-SNAPSHOT against an ActiveMQ 5.7.0 server or do i need to install a snapshot distribution of the server as well? (I'm working together with Mikael Falkvidd who commented above).	0	0	https://issues.apache.org/jira/browse/AMQ-4305
18213	AMQ-4303	Can we resolve this now?	0	0	https://issues.apache.org/jira/browse/AMQ-4303
18214	AMQ-4292	Hi Kevin, I just tried to stick in the Thread.sleep(100) bit, but that did not help me reproduce the issue. Are your still running into this?	1	0	https://issues.apache.org/jira/browse/AMQ-4292
18215	AMQ-4204	Are you using the JMS bridge of ActiveMQ http://activemq.apache.org/jms-to-jms-bridge.html Or are you using the activemq-camel component and letting Camel be the bridge?	0	0	https://issues.apache.org/jira/browse/AMQ-4204
18216	AMQ-4188	Claus did you get anywhere on this one?	1	1	https://issues.apache.org/jira/browse/AMQ-4188
18217	AMQ-4165	The functionnality provided by this mode had its issues (such the one i stumbled upon https://issues.apache.org/jira/browse/AMQ-3688) But it was exposed as a valid option in the documentation until recently (and not completly removed yet) ; cutting it like that is harsh. None of the few "alternatives" can handle the same use cases, and are expecting a very different set of requirements (such as a database or a shared filesystem). Is there any plan to complete the amq options in this area or is the project dropping the ball on HA ?	1	0	https://issues.apache.org/jira/browse/AMQ-4165
18218	AMQ-4146	Hiram, where can we document this? I wonder if you can add a note about this change/new feature in ActiveMQ 5.8 at http://activemq.apache.org/selectors.html	1	0	https://issues.apache.org/jira/browse/AMQ-4146
18219	AMQ-4144	Is this one good now?	1	0	https://issues.apache.org/jira/browse/AMQ-4144
18220	AMQ-4125	@Gary the two store adapters are now marked as deprecated in the trunk code, should we close this out and open a separate ticket to remove the activemq-amq-strore module in v5.9?	0	0	https://issues.apache.org/jira/browse/AMQ-4125
18221	AMQ-4120	Dont we have a SQL server adaptor now? Can you check AMQ 5.9 release?	0	0	https://issues.apache.org/jira/browse/AMQ-4120
18222	AMQ-4120	This still happens in 5.13.2. Is it safe to ignore the warnings?	0	0	https://issues.apache.org/jira/browse/AMQ-4120
18223	AMQ-4093	seems like this should be categorized as severe unless there is a known workaround. how are others dealing with this issue? tested briefly using the multiple kahadb persistence adapter approach to create a separate store for each queue...this seems to work, but may not scale for large number of queues. I also tried this scenario with AMQ 5.9/leveldb and get similar behavior (few messages in single queue block message store cleanup, etc)...this was unexpected.	0	0	https://issues.apache.org/jira/browse/AMQ-4093
18224	AMQ-4085	Do you have a unit test to demonstrate your issue? In some cases this is a non-recoverable error so having the failover transport spin on it wouldn't make any sense.	1	1	https://issues.apache.org/jira/browse/AMQ-4085

#	Requirement	Questions	Answered	Successfully Answered	URL
18225	AMQ-4085	Could you tell me where is the logic or what's the class and method in the broker to close the connection after a short delay. I have checked the source code in the following URL but found no delay closure is involved, http://svn.apache.org/repos/asf/activemq/tags/activemq-5.6.0/activemq-core/src/main/java/org/apache/activemq/broker/TransportConnection.java(processAddConnection) http://svn.apache.org/repos/asf/activemq/tags/activemq-5.7.0/activemq-core/src/main/java/org/apache/activemq/broker/TransportConnection.java(processAddConnection) Or maybe this is only fixed in fusesource releases?	0	0	https://issues.apache.org/jira/browse/AMQ-4085
18226	AMQ-4082	Would it also be possible to do some sort of graceful shutdown (eg as we do in Camel). To allow amble time for inflight messages to complete, and to deny new messages from coming in etc.	0	0	https://issues.apache.org/jira/browse/AMQ-4082
18227	AMQ-4079	Can you point out what you needed to do to make this happen in the Camel build case? The current ActiveMQ source builds as a result of the source plugin in the Apache parent pom from what I can tell and takes the name from the root pom which is the oddly named activemq-parent one.	1	1	https://issues.apache.org/jira/browse/AMQ-4079
18228	AMQ-4053	commons-beanutils-1.8.3.jar commons-beanutils-core-1.8.0.jar - ought to be same version number jsp-2.1-6.1.14.jar jsp-api-2.1-6.1.14.jar - the api is possible in the jsp itself servlet-api-2.5-20081211.jar servlet-api-2.5-6.1.14.jar - should remove the 1st JAR spring-oxm-1.5.10.jar spring-oxm-tiger-1.5.10.jar - I think this is part of spring 3 now stax-api-1.0-2.jar stax-api-1.0.1.jar stax2-api-3.0.2.jar - gotta figure out what to keep xpp3-1.1.4c.jar xpp3_min-1.1.4c.jar - is the _min needed? And in lib/web we have some JSP JARs from glassfish. Wonder if we should use the same JARs as in lib/optional ? core-3.1.1.jar - what is this JAR?	0	0	https://issues.apache.org/jira/browse/AMQ-4053
18229	AMQ-4034	When you add the AMQP transport in the activemq.xml like: {code} <transportConnector name="amqp" uri="amqp://0.0.0.0:5672?maximumConnections=1000&wireformat.maxFrameSize=104857600"/> {code} And then you connect to it via AMQP, the following exception is generated: {code} Exception in thread "ActiveMQ Transport Server Thread Handler: amqp://0.0.0.0:5672?maximumConnections=1000&wireformat.maxFrameSize=104857600" java.lang.NoClassDefFoundError: org/apache/qpid/proton/jms/JMSVendor at org.apache.activemq.transport.amqp.AmqpTransportFilter.<init>(AmqpTransportFilter.java:52) at org.apache.activemq.transport.amqp.AmqpTransportFactory.compositeConfigure(AmqpTransportFactory.java:44) at org.apache.activemq.transport.TransportFactory.serverConfigure(TransportFactory.java:246) at org.apache.activemq.transport.amqp.AmqpTransportFactory.serverConfigure(AmqpTransportFactory.java:56) at org.apache.activemq.transport.tcp.TcpTransportServer.handleSocket(TcpTransportServer.java:415) at org.apache.activemq.transport.tcp.TcpTransportServer$1.run(TcpTransportServer.java:348) at java.lang.Thread.run(Thread.java:722) Caused by: java.lang.ClassNotFoundException: org.apache.qpid.proton.jms.JMSVendor not found by org.apache.activemq.activemq-osgi [54] at org.apache.felix.framework.BundleWiringImpl.findClassOrResourceByDelegation(BundleWiringImpl.java:1460) at org.apache.felix.framework.BundleWiringImpl.access$400(BundleWiringImpl.java:72) at org.apache.felix.framework.BundleWiringImpl$BundleClassLoader.loadClass(BundleWiringImpl.java:1843) at java.lang.ClassLoader.loadClass(ClassLoader.java:356) {code}	1	1	https://issues.apache.org/jira/browse/AMQ-4034
18230	AMQ-4032	I maybe misunderstand... but it seems to me that JMX connections through the RemoteJMXBrokerFacade already supports failover.. {code} String jmxUri = properties.getProperty("jmxUri"); Properties p = System.getProperties(); p.setProperty("webconsole.jmx.url", jmxUri); brokerProxy = new RemoteJMXBrokerFacade(); SystemPropertiesConfiguration spc = new SystemPropertiesConfiguration(); brokerProxy.setConfiguration(spc); {code} I am able to failover back and forth between the AMQ nodes and the RemoteJMXBrokerFacade in the client connects to the other node on the next call. Is there something I am missing?	0	0	https://issues.apache.org/jira/browse/AMQ-4032
18231	AMQ-4027	Is there no ending dot in Oracle? I wonder if it's not better to do a startsWith test instead? And test for starting with "Oracle". ?	0	0	https://issues.apache.org/jira/browse/AMQ-4027
18232	AMQ-4024	Gary, shall we create a configuration switch for that? If yes, are transport addresses exchanged in any other functionality? I'm pondering whether to keep the switch as part of the rebalancing options, or whether it makes sense to promote it to the <broker /> level? e.g. {code} <broker name="abc" networkAddressStrategy="fqdn|hostname|ipaddr"> ... </broker> {code}	0	0	https://issues.apache.org/jira/browse/AMQ-4024
18233	AMQ-4009	We're going to need a bit more information here in order to help you out. Can you elaborate please?	0	0	https://issues.apache.org/jira/browse/AMQ-4009
18234	AMQ-3978	Can we bump up the Priority of this issue, this becomes a major problem in a high volume setup. A single message in DLQ effects the entire system, is there a known work around for this issue?	1	1	https://issues.apache.org/jira/browse/AMQ-3978
18235	AMQ-3978	With AMQ-6203 being closed, how far are we from having decent log compaction (as described in AMQ-3978 or the other related Jira issues)?	1	0	https://issues.apache.org/jira/browse/AMQ-3978
18236	AMQ-3944	Test Joram JMS conformacne cases added in rev 1365608. Use JoramJmsTest to execute them. It currently has 4 tests commented out since they are failing. Need to look deeper to see why.	1	1	https://issues.apache.org/jira/browse/AMQ-3944
18237	AMQ-3933	can you attach your test or describe the nature of it?	0	0	https://issues.apache.org/jira/browse/AMQ-3933
18238	AMQ-3917	@Timothy Can you please give some overview how you fixed this? Do you use the 'id' itself to identify a subscription uniquely? Is 'activemq.subscriptionName' header still there or is it removed? We have some hacks in our code and getting more understanding of your fix would help us remove those hacks when we move to ActiveMQ 5.7.0. Thanks in advance!!	0	0	https://issues.apache.org/jira/browse/AMQ-3917
18239	AMQ-3914	can u validate that the existing: org.apache.activemq.store.jdbc.adapter.TransactJDBCAdapter will work happily with 4.0. You need to specify {{adapter="org.apache.activemq.store.jdbc.adapter.TransactJDBCAdapter"}} in the xml config for jdbc. If that is the case, all that is needed is a copy of: http://svn.apache.org/viewvc/activemq/trunk/activemq-core/src/main/resources/META-INF/services/org/apache/activemq/store/jdbc/microsoft_sql_server_jdbc_driver_3_0?view=log to ..microsoft_jdbc_driver_4_0_for_sql_server	1	1	https://issues.apache.org/jira/browse/AMQ-3914
18240	AMQ-3914	Thanks Petr. I have fixed this. Does the file naming look correct to you? {code} davsclaus:(svn)activemq[trunk:1442509]/$ svn commit --message "AMQ-3914: MS SQL JDBC driver 4.0 fixed. Thanks to Petr Nídl for the details." Adding activemq-jdbc-store/src/main/resources/META-INF/services/org/apache/activemq/store/jdbc/lock/microsoft_jdbc_driver_4_0_for_sql_server Adding activemq-jdbc-store/src/main/resources/META-INF/services/org/apache/activemq/store/jdbc/microsoft_jdbc_driver_4_0_for_sql_server Deleting activemq-jdbc-store/src/main/resources/META-INF/services/org/apache/activemq/store/jdbc/microsoft_sql_server_jdbc_driver_4_0 Committed revision 1442517. {code}	1	1	https://issues.apache.org/jira/browse/AMQ-3914
18241	AMQ-3901	Can you provide some more information here like broker versions, what the client's are doing around the time you see this etc.	0	0	https://issues.apache.org/jira/browse/AMQ-3901

#	Requirement	Questions	Answered	Successfully Answered	URL
18242	AMQ-3894	A useful feature! XML tidbit, it's <redeliveryPolicyEntries> Also, when setting sendToDlqIfMaxRetriesExceeded="false", a message gets silently dropped when max retries is reached. Expected, and if so, worth documenting? I'd have expected the message stays in the queue.	1	0	https://issues.apache.org/jira/browse/AMQ-3894
18243	AMQ-3888	Can't that be another artifact? Something like activemq-jee-specs ? It's better to add one dependency (to run on Tomcat; which would conflict anyway with the jetty dependnecy today) than having to exclude 8 artifacts or define them one by one with 'provided' scope.	0	0	https://issues.apache.org/jira/browse/AMQ-3888
18244	AMQ-3886	Nicholas, do you work on a patch for this?	0	0	https://issues.apache.org/jira/browse/AMQ-3886
18245	AMQ-3883	Hello Freeman, Would it not be better to compare the getName() method of Principal interface? For example: public boolean equals(Object o) { if (this == o) { return true; } if(o instanceof Principal) { if (((Principal) o).getName().equals(this.getName())) { return true; } } if (o == null || getClass() != o.getClass()) { return false; } final GroupPrincipal that = (GroupPrincipal)o; if (!name.equals(that.name)) { return false; } return true; } This way, compare will not only work with any other JAAS implementation.	1	0	https://issues.apache.org/jira/browse/AMQ-3883
18246	AMQ-3876	There is some overlap with trace=true&startLogging=false&dyanmicManagement=true tcp transport options. These allow u to enable (via jmx) trace logging on a connection, of all of the operwire commands. Accessing the log remotely I guess is still a difficulty but a using a remote appender would sort that. did you find some limitations with the existing TcpTransport trace support?	0	0	https://issues.apache.org/jira/browse/AMQ-3876
18247	AMQ-3876	I've had trouble in the past configuring transport tracing, and was never able to set it up dynamically. Can you walk me through how to use the Transport tracing to address the following scenario (which we just recently had in production)? - NMS Client reports that they are not receiving messages - Via VisualVM, we found the Subscription has increasing Enqueue and Dequeue counts - Now we want to tap that connection to see just what is "crossing the wire" I am concerned about the complexity of configuring loggers, but I admit there's much there with which I am not knowledgable. Such as remote loggers. Only yesterday did I learn how to dynamically change logger levels via the log4j MBean. One big consideration is keeping this tracing separate from other log activity to both (a) keep from generating large volumes of noise in the normal logs and (b) to keep the tracing easy to read. (BTW - I'm an old UNIX/C developer at heart. This prototype is modeled on truss/strace/tcpdump)	1	0	https://issues.apache.org/jira/browse/AMQ-3876
18248	AMQ-3861	And is there something you want to do on the AMQ side? If not we should resolve this ticket.	1	1	https://issues.apache.org/jira/browse/AMQ-3861
18249	AMQ-3833	Gary, can this be moved to 5.8 release?	0	0	https://issues.apache.org/jira/browse/AMQ-3833
18250	AMQ-3779	Hi Gary, I Was looking for exactly the same functionality for one of our new use cases. Was happy to found a request but seems like this has been long forgotten. Can this be taken up for the next version please? Thanks, Bhanu	1	0	https://issues.apache.org/jira/browse/AMQ-3779
18251	AMQ-3723	Have you tried with a newer release of xbean? There is a 3.11.1 release http://search.maven.org/#artifactdetails%7Corg.apache.xbean%7Cxbean-spring%7C3.11.1%7Cbundle	1	1	https://issues.apache.org/jira/browse/AMQ-3723
18252	AMQ-3693	I have attached a patch for this work, but please note that the patch was created against Jetty 7.6.0.RC4. The changes will need to use the full Jetty 7.6.0 release when that release is made available. Is it possible to get a new version of ActiveMQ cut when Jetty 7.6.0 is released so that this CVE can be addressed right away?	0	0	https://issues.apache.org/jira/browse/AMQ-3693
18253	AMQ-3693	Applying the new patch and running locally, access to the AMQ web console produces large numbers of the following exception on the broker: {noformat} WARN | /admin/styles/prettify.css;jsessionid=16o74xc6vb13s1dc6cpufjy8de java.lang.NullPointerException at org.eclipse.jetty.security.SecurityHandler.handle(SecurityHandler.java:514) at org.eclipse.jetty.server.session.SessionHandler.doHandle(SessionHandler.java:227) at org.eclipse.jetty.server.handler.ContextHandler.doHandle(ContextHandler.java:1031) at org.eclipse.jetty.servlet.ServletHandler.doScope(ServletHandler.java:406) at org.eclipse.jetty.server.session.SessionHandler.doScope(SessionHandler.java:186) at org.eclipse.jetty.server.handler.ContextHandler.doScope(ContextHandler.java:965) at org.eclipse.jetty.server.handler.ScopedHandler.handle(ScopedHandler.java:117) at org.eclipse.jetty.server.handler.HandlerCollection.handle(HandlerCollection.java:149) at org.eclipse.jetty.security.SecurityHandler.handle(SecurityHandler.java:499) at org.eclipse.jetty.server.handler.HandlerCollection.handle(HandlerCollection.java:149) at org.eclipse.jetty.server.handler.HandlerWrapper.handle(HandlerWrapper.java:111) at org.eclipse.jetty.server.Server.handle(Server.java:349) at org.eclipse.jetty.server.AbstractHttpConnection.handleRequest(AbstractHttpConnection.java:449) at org.eclipse.jetty.server.AbstractHttpConnection$RequestHandler.headerComplete(AbstractHttpConnection.java:910) at org.eclipse.jetty.http.HttpParser.parseNext(HttpParser.java:634) at org.eclipse.jetty.http.HttpParser.parseAvailable(HttpParser.java:230) at org.eclipse.jetty.server.AsyncHttpConnection.handle(AsyncHttpConnection.java:76) at org.eclipse.jetty.io.nio.SelectChannelEndPoint.handle(SelectChannelEndPoint.java:609) at org.eclipse.jetty.io.nio.SelectChannelEndPoint$1.run(SelectChannelEndPoint.java:45) at org.eclipse.jetty.util.thread.QueuedThreadPool.runJob(QueuedThreadPool.java:599) at org.eclipse.jetty.util.thread.QueuedThreadPool$3.run(QueuedThreadPool.java:534) at java.lang.Thread.run(Thread.java:662) {noformat}	0	0	https://issues.apache.org/jira/browse/AMQ-3693
18254	AMQ-3692	Can you provide a bit more documentation how you would use this?, eg how you would configure this in the broker XML file.	1	1	https://issues.apache.org/jira/browse/AMQ-3692
18255	AMQ-3692	ActiveMQ provides karaf commands to check the status of brokers etc. Can you not use that as well? I would assume these commands can tell you that the broker is not available as well.	1	1	https://issues.apache.org/jira/browse/AMQ-3692
18256	AMQ-3687	Thomas, do you work on patches?	0	0	https://issues.apache.org/jira/browse/AMQ-3687
18257	AMQ-3644	Have you raised this issue with Apache Derby? People very often uses prepared statements for the same SQL queries to be executed.	1	0	https://issues.apache.org/jira/browse/AMQ-3644
18258	AMQ-3634	Hi Dejan Are you also handling this case here? http://activemq.2283324.n4.nabble.com/KahaDB-detecting-corrupt-index-file-td2541943.html	1	0	https://issues.apache.org/jira/browse/AMQ-3634
18259	AMQ-3623	I looked at the patch and I just noticed that the appender is added to the logging system but it is not removed when the test has completed. Since the appender references the test case then the test case instance will never be reclaimed until the logging system is removed and that is when the application ends. Would you consider adding the code that remove the added appender when the test has completed.	1	0	https://issues.apache.org/jira/browse/AMQ-3623

#	Requirement	Questions	Answered	Successfully Answered	URL
18260	AMQ-3621	An update for those following this issue that might not be following the ActiveMQ dev mailing list: I made quite a bit of progress over the weekend. Here is the result of the latest effort: https://github.com/lhazlewood/activemq/tree/trunk/activemq-shiro Change log is here: https://github.com/lhazlewood/activemq/commit/be2100ea2c5a421cd21a4c3ae158c65e6e14490f It works as follows: The ShiroPlugin installs 2 BrokerFilters at the moment: - A SubjectFilter which is responsible for constructing and associating a Subject instance with Connections. Downstream filters perform actual security checks. - An AuthenticationFilter (downstream from the SubjectFilter) that enforces client authentication as necessary. It supports system and anonymous connections as well if desired. I still have to create an AuthorizationFilter (that would be downstream from the AuthenticationFilter) that would allow access control checks (can you subscribe to a destination or not, etc). All of this code is tested with 100% class, method and line coverage. Comments, suggestions and feedback are most welcome.	1	1	https://issues.apache.org/jira/browse/AMQ-3621
18261	AMQ-3621	Hi Claus, The initial implementation is complete and has 100% test coverage for all functionality. The only thing remaining is to finish up the documentation: http://activemq.apache.org/shiro.html How would you guys like to receive the code contribution? Can we get it in to the 5.10 release? As an Apache PMC Chair, I already have CLAs on file, so everything should be clear/ready to go.	1	1	https://issues.apache.org/jira/browse/AMQ-3621
18262	AMQ-3621	Actually, I recant that last statement :) There are some minor architectural changes I want to clean up first before they make it into the ActiveMQ repository. When are you guys releasing 5.10? I'd like to get it in that release if possible.	1	1	https://issues.apache.org/jira/browse/AMQ-3621
18263	AMQ-3621	Les, I've committed this to trunk. Suggestions: Can you please finish documenting the Authentication and Authorization sections toward the bottom (marked "work in progress" at the moment). Maybe add referring links (or details if you have it working) about how to integrate with some of the other system Shiro supports (like LDAP, certs?) For the authorization part would be great to explain the verbs allowed (create, remove, wildcards, etc) Can you also give a note about the default behavior of vm:// connectors being treated as 'system' user? Otherwise, everything looks great. Thanks for all the unit tests, that definitely makes life easier :) Keep an eye out on the next nightly builds that include this commit. Please review that nightly and verify that it's to your liking. Commit: To https://git-wip-us.apache.org/repos/asf/activemq.git e7e317d..f9451e5 trunk -> trunk	1	0	https://issues.apache.org/jira/browse/AMQ-3621
18264	AMQ-3621	Has the docs been updated? Is there more work on this?	0	0	https://issues.apache.org/jira/browse/AMQ-3621
18265	AMQ-3621	Is there fore example an activemq-shiro feature to install in Karaf?	0	0	https://issues.apache.org/jira/browse/AMQ-3621
18266	AMQ-3615	Hi Timothy Bish, Pls help me ! My application use JMS for sending message. My client sends a request to the server. While the server is working with my request, my client stops (network problem) before the server finishes. When the server is finished, it'll return to the client, but the server can't see the client which sent the request to server, at which point, the server will return an exception in log file. The exception is : javax.jms.InvalidDestinationException: Cannot publish to a deleted Destination: temp-queue://ID:PC0092-49463-1344231871819-0:0:9 [^] And now I use jms.watchTopicAdvisories for fix this problem, And it's ok, I can't see this problem in the log file. My question is : what are you doing with exception in this case :) ? Sorry If it's stupid question :) Thanks, Dung	0	0	https://issues.apache.org/jira/browse/AMQ-3615
18267	AMQ-3573	Isn't there an API in JDK6+ now that you can ask for disk space?	0	0	https://issues.apache.org/jira/browse/AMQ-3573
18268	AMQ-3569	Gary whats the status of this? Can it be moved to 5.8 if there is still work to do?	1	0	https://issues.apache.org/jira/browse/AMQ-3569
18269	AMQ-3564	Does this work with multiple slaves? (quite a usual scenario)	1	0	https://issues.apache.org/jira/browse/AMQ-3564
18270	AMQ-3541	Tim- There isn't currently a unit test for the TimeStampingBrokerPlugin. I'd be more than happy to write one. Is there a current plugin unit test that you suggest I should use as a starting point? Thanks, Matt Pavlovich	1	1	https://issues.apache.org/jira/browse/AMQ-3541
18271	AMQ-3491	This issue was referred to by Gary Tully in http://activemq.2283324.n4.nabble.com/5-5-Downloads-tp3897983p3898090.html. I cannot find a single download for any version of ActiveMQ on any mirror site or the primary site. Were all versions pulled due to this issue? Is there a timeframe for the software to be available to download agin? Thanks!	1	1	https://issues.apache.org/jira/browse/AMQ-3491
18272	AMQ-3491	First I have to say I really appreciate the decisive action on this unfortunate issue - you guys did the right thing. I have a suggestion for the future (and for all ASF projects, really). Would you consider running something like Black Duck Protex or equivalent as part of pre-release testing - to assure users that there are no license incompatability issues? Maybe running the checks just for major releases at least? {color:red}*If every ASF project could access some license-checking tool*{color} (and use it as a pre-release check) it would add great value to the ASF brand - assuring users that *all reasonable steps* have been taken to avoid any licensing difficulties.	0	0	https://issues.apache.org/jira/browse/AMQ-3491
18273	AMQ-3476	I will try to write a testcase however with the current test cases I run into a build error, using maven 3 and this command line from the activemq-core folder: mvn test -Dtest=org.apache.activemq.transport.stomp.Stomp11Test.java Result: Running org.apache.activemq.transport.stomp.Stomp11Test Tests run: 15, Failures: 0, Errors: 15, Skipped: 0, Time elapsed: 3.042 sec <<< FAILURE! Results : Tests in error: testConnect(org.apache.activemq.transport.stomp.Stomp11Test): Error creating b ean with name 'org.apache.activemq.xbean.XBeanBrokerService#0' defined in class path resource [org/apache/activemq/transport/stomp/stomp-auth-broker.xml]: Insta ntiation of bean failed; nested exception is java.lang.ExceptionInInitializerErr or (... many similar messages) Are additional configuration parameters necessary to run the tests? Many thanks in advance	0	0	https://issues.apache.org/jira/browse/AMQ-3476
18274	AMQ-3476	Looks like your classpath is not right, how are you running the tests? From inside and IDE?	0	0	https://issues.apache.org/jira/browse/AMQ-3476
18275	AMQ-3453	Gary, thanks for the quick reply. I remember doing this some time back but could not infer much from it. Can you please let me know what kind of patterns I can search for in the log file to find out such destinations.	1	1	https://issues.apache.org/jira/browse/AMQ-3453
18276	AMQ-3453	James / Gary, Can you let me know what kind of pattern (any key words) I should be searching for from the log file. I believe it would be logging a lot of things once I start the broker in DEBUG or TRACE mode. I have spent a lot of time trying to resolve this, so looking for some help in directly identifying the issue.	1	1	https://issues.apache.org/jira/browse/AMQ-3453
18277	AMQ-3411	svn add activemq-console/src/test/java/org/apache/activemq/console Must be done or the tests will be lost. This patch adds: " --user <user> Set the username to use connecting", " --password <password> Set the password to use connecting", " --factory <Class> Set connection factory that should be used for creating connections", " Must be a subclass of ActiveMQConnectionFactory", " --passwordFactory <Class> Set class which will do password lookups", " Must be a subclass of PasswordFactory", And fixes the AmqMessagesUtil to use the connection factory so username/password are used for the connections.	0	0	https://issues.apache.org/jira/browse/AMQ-3411
18278	AMQ-3410	What happened here is the patch didn't result in the avn add: svn add activemq-console/src/test/java/org/apache/activemq/console	0	0	https://issues.apache.org/jira/browse/AMQ-3410

#	Requirement	Questions	Answered	Successfully Answered	URL
18279	AMQ-3394	can you provide a test case that captures this use case? currently a redispatch of an in-flight message is tied to consumer close. I guess you want that tied to a timer? the abort slow consumer policy is one way to tie the death of a consumer to a timer. is that close to what you want?	1	1	https://issues.apache.org/jira/browse/AMQ-3394
18280	AMQ-3394	Hi Gary, thanks for the inquiry. I'm not sure co-mingling slow consumer policy with this semantics will achieve the same, but I need to study it some more. The test case or rather, workflow, would go something like this: 1. A "work" message is queued. 2. The "work" message is de-queued by consumer A. It is now off the queue (or hidden) and the "work" is being performed by consumer A. However, the broker has triggered the message's TTL (or some other time indicator) specified by the producer who published it. Say 2 minutes for this message. 3. Consumer A is set to INDIVIDUAL_ACKNOWLEDGE and has not yet acknowledged the message because it is attemping to process the "work" from it. If successful, it will ACK the message. 4. Consumer A suffers a power outage while processing the message and never ACKS it. 5. 2 minutes expire and the original "work" message re-appears on the queue (presumably by the broker). 6. Consumer B receives the or9iginal "work" message, processes the work successfully and ACKS the message after that (within 2 minutes). The message is gone forever now. All are happy. Does this make sense? The idea for this comes from Amazon's Simple Queue Service which provides this semantics.	0	0	https://issues.apache.org/jira/browse/AMQ-3394
18281	AMQ-3388	How about working up a patch file and attaching with grants to apache?	0	0	https://issues.apache.org/jira/browse/AMQ-3388
18282	AMQ-3383	Would it make more sense here to use a byte array instead of a string?	1	1	https://issues.apache.org/jira/browse/AMQ-3383

18302	AMQ-3003	@Gary Have you tested this. I have tried to implementing this, but it seems that the message still goes back to the DLQ of the topic.	1	1	https://issues.apache.org/jira/browse/AMQ-3003
18303	AMQ-2922	Our first stab at implementing mutliple stores, with example configuration file. Are we on the right track with this approach and is this something that could be included in a future release?	0	0	https://issues.apache.org/jira/browse/AMQ-2922
18304	AMQ-2922	Is there a way to configure all DLQs to use one persistence adapter, rather than having to list them out one-by-one? DLQs get processed offline, and so separating them from "live" queues would be a great configuration option.	1	0	https://issues.apache.org/jira/browse/AMQ-2922
18305	AMQ-2922	We have a standard of creating DLQs with the suffix .DLQ. Example Sample.Queue.DLQ Tried the below wild card with filtered kaha db. Doesnt seem to work. <filteredKahaDB queue=">.DLQ"> Is this supported? How could we solve this.	0	0	https://issues.apache.org/jira/browse/AMQ-2922

#	Requirement	Questions	Answered	Successfully Answered	URL
18306	AMQ-2911	Here is the patch for the 5.5 SNAPSHOT (10th Sept 2010)	1	1	https://issues.apache.org/jira/browse/AMQ-2911
18307	AMQ-2875	Hi Adrian- I definitely agree that there is room for improvement on the networkConnector/network of brokers front to make it more usable, specifically in the large-scale scenarios you describe. A couple of comments: 1. Any improvement or modification to networkConnector-type configuration would be greatly enhanced by having the configuration be dynamically updatable and persisted. (ie.. save JMX/REST config changes to the activemq.xml file) 2. What do you think about supporting the "host" portion of the JMS url for routing? It seems to me that what you are describing might be achieved by supporting that, instead of tracking advisories up and down nodes. Having the ability to support routing a message to "kiosk46" when specifying the destination as "queue://kiosk46/MY_QUEUE" and client sending message to "brokerA" (HQ) might be easier to implement and manage than a number of network/tree connectors. This would also make migrations from commercial platforms that currently support this, such as MQ series, more straightforward. Thoughts? In my personal experience from implementing ActiveMQ at a global organization with 1000's of nodes is that the number of queues can become problematic in a straight-forward network-of-brokers model. Also, if all the endpoints have unique queues, it pushes the complexity to the application developers which creates a negative developer experience (imho). [Preferred-- Apps deployed to kiosk46 know to connect to queues and don't need to know anything about its current host] Host: Kiosk46 - queue:///ORDERS_Q - queue:///TICKETS_Q - queue:///INVENTORY_Q Host: Kiosk48 - queue:///ORDERS_Q - queue:///TICKETS_Q - queue:///INVENTORY_Q [Versus-- Apps need to consider their location when creating queue names] Host: Kiosk46 - queue:///K46_ORDERS_Q - queue:///K46_TICKETS_Q - queue:///K46_INVENTORY_Q host: Kiosk48 - queue:///K48_ORDERS_Q - queue:///K48_TICKETS_Q - queue:///K48_INVENTORY_Q Thanks, Matt Pavlovich	1	0	https://issues.apache.org/jira/browse/AMQ-2875
18308	AMQ-2834	Is it expected that BrokerService will log an error about temporary store limit and max journal file size if your broker is not configured as persistent?	1	1	https://issues.apache.org/jira/browse/AMQ-2834
18309	AMQ-2826	So any suggestions on how to proceed? The maven profile for now could simply prevent the tests from being run... Not sure what type of infrastructure is available in the CI environment, as far as having the ability to stand up a single node cassandra and zookeeper instance to run the tests agains at some point... How is the JDBC Store tested against all the different vendors that are supported?	1	1	https://issues.apache.org/jira/browse/AMQ-2826
18310	AMQ-2826	Hi Scott, Has there been any movement on QSandra in the last two years? Do you know of anyone using it in production? Or is it a now defunct project? Any information would be helpful! Thanks, Les	1	0	https://issues.apache.org/jira/browse/AMQ-2826
18311	AMQ-2821	Without this improvement, is an inactive queue reference (without any producer nor consumer) propagated to all brokers in a network of brokers topology ? Or does this reference finish to disappear after the non simultaneous restart of all brokers ? Eric-AWL	1	0	https://issues.apache.org/jira/browse/AMQ-2821
18312	AMQ-2716	{quote} target <---------- sender \ \/ temp reply queue ----------> receiver {quote} Now I close the resource in following order. {quote} receiver.close(); replyQueue.delete(); sender.close(); session.close(); connection.close(); {quote} does AMQ not follow the javax.jms.Connection definition? Even in the javadoc from ActiveMQConnection#close there is the same description... {quote} Closing a connection causes all temporary destinations to be deleted. {quote} But it seems that we must delete temp queue explicitly	1	1	https://issues.apache.org/jira/browse/AMQ-2716
18313	AMQ-2702	rev 935952 introduced activemq-spring module and moved a few classes there. Incidentally activemq-pool module doesn't have spring dependency any more. The main question is what should we do with all tests in activemq-core (and other modules), that depends on Spring (and preventing us to do a better separation). IMHO we should move them either in this newly-created activemq-spring module or activemq-all module or even previously created sys test project. It will require some refactoring and probably make debugging a bit harder, but I think it's the move we have to make.	0	0	https://issues.apache.org/jira/browse/AMQ-2702
18314	AMQ-2702	Now that this class is in the separate activemq-spring module, would it be possible to reintroduce the {{InitializingBean}} and {{DisposableBean}} interfaces on the {{PooledConnectionFactoryBean}} (cfr. AMQ-2702.diff) so it can be used in a plain Spring context without requiring the use of {{<context:annotation-driven/>}} to init/destroy the bean?	0	0	https://issues.apache.org/jira/browse/AMQ-2702
18315	AMQ-2668	individual store limits may not be possible as the store is shared, but possibly a precent store usage usage metric would work. request queue could block on 70% full and response queue could block on 100% full. This approach is already uses by the cursors via the cursorMemoryHighWaterMark. Do you think that would satisfy your use case?	1	1	https://issues.apache.org/jira/browse/AMQ-2668
18316	AMQ-2664	This is probably a good idea but... may not be sufficient for some QA tools that uses the classes (e.g. FindBugs). Does the activemq-core require every version of OpenWire bundled in? Could they be different jars? I may be totally wrong... Benoit	1	0	https://issues.apache.org/jira/browse/AMQ-2664
18317	AMQ-2636	Thanks for committing our initial patch! I will shortly be attaching a second patch (against svn revision 921822 of the ActiveMQ trunk) that adds in support for setting the Type Of Service bits as well as the Differentiated Services bits. The patch will also cleans up some tabs and incorrect spacing that I mistakenly let slip into the previous patch as well as does some refactoring on the TransportUriTests. When would it be appropriate for me to add new information about this new Transport option to the existing documentation (http://activemq.apache.org/tcp-transport-reference.html)?	1	1	https://issues.apache.org/jira/browse/AMQ-2636
18318	AMQ-2636	This patch fixes an issue that was discovered by running our automated wireshark test scripts where I was assuming the wrong two bits for the ECN bits, and so only multiples of 4 were working on machines which use 0 for the default ECN. (tested against trunk) The code for the automated wireshark test scripts can currently be found here: http://maljub01.svnrepository.com/comp190/trac.cgi/browser/scripts/dscp_test Is there some way we can either include the automated wireshark test scripts somewhere in the ActiveMQ trunk (maybe as an example, since it involves a Producer that communicates with the ActiveMQ broker) or put it somewhere on the ActiveMQ website so that future uses can benefit from it?	0	0	https://issues.apache.org/jira/browse/AMQ-2636

#	Requirement	Questions	Answered	Successfully Answered	URL
18319	AMQ-2591	I think the heart of the issue here is that security can be tricky with activemq (at least as far as locking down queues). The idea for easy security was to use the browser session id as the queue name... like "A653D78C432AEEC38D142ACCD2703BAF.queue" If the connection to the server was in SSL... there would be a very low risk of man in the middle attacks. Then to get your private messages you would just subscribe up to this session id queue name. Since it is very unlikely anyone could guess your session id... it would be very unlikely that anyone could guess your queue name. The idea would be that unless they knew your session id... they would have no idea which queue to subscribe to to eavesdrop on your messages. Along with this... we look at write only queues or topics for the server to listen to. That way people can publish messages upstream with their session id attached... however no body but the server could read them. The point was brought up however... that AMQ lets you wildcard subscriptions. In this case... they could listen to all queues and would have no trouble finding your "private" queue. I think the general hope is for a way to make a queue private without having to have an authentication mechanism for each individual user subscribing to queues. Our system for example has thousands of users all needing one private queue to receive "secret" messages on. It seems a little daunting to give each of these users unique passwords to access their queue. If there was a way to stop wildcarding... are there other holes people see with this approach?	0	0	https://issues.apache.org/jira/browse/AMQ-2591
18320	AMQ-2485	The master needs to be restarted and the slave attached again. A slave cannot play catch up with an already started and active master. there is a waitForSlave option on a master that can facilitate the synchronized start of the master. Would this suffice?	0	0	https://issues.apache.org/jira/browse/AMQ-2485
18321	AMQ-2476	yea, this is long over due. Just wonder about sandbox rather than a sub module off trunk. Think a sub module on trunk and a default profile that does not execute tests may be best as it will be part of the default compilation. what is the benefit of using the sandbox?	1	0	https://issues.apache.org/jira/browse/AMQ-2476
18322	AMQ-2456	Hi, could a commiter have a look at this patch and see if it's ok to commit. We've been running it in production for a while now and it shows no problems (and is useful). cheers, James.	1	1	https://issues.apache.org/jira/browse/AMQ-2456
18323	AMQ-2456	Hi, I use this plugin but i have a problem with a ssl connection. When the connection is open with the option duplex=false, all work correctly, ssl and tcp. But with the option duplex=true, the plugin doesn't use the ssl configuration. Do you have an explanation? Thanks! Rémy lesiak	1	1	https://issues.apache.org/jira/browse/AMQ-2456
18324	AMQ-2456	Hi Remy, what version of ActiveMQ ? Also, can you send me the relevant connector section of the activemq.xml for both brokers. cheers, James.	1	1	https://issues.apache.org/jira/browse/AMQ-2456
18325	AMQ-2455	This issue is certainly not fixed for me in 5.4.1. Is there any additional configuration I need to do? Source and config for my bridge setup to OpenMQ is here : http://github.com/centraldesktop/openmq-spring-bean	0	0	https://issues.apache.org/jira/browse/AMQ-2455
18326	AMQ-2444	so it states the three conditions, any of which can occur depending on the application. But if any occur, redelivery based on the current redelivery policy will ensue. Any configured redelivery policy will effect all three conditions. How would you word it differently?	1	1	https://issues.apache.org/jira/browse/AMQ-2444
18327	AMQ-2438	To be very precise, I dont have a failover trasport configured so I dont have a backup broker. If my activemq server dies or there is a network outage, when I restart my server will the server automatically recover to guarantee zero message loss or duplication in event of server failure?	0	0	https://issues.apache.org/jira/browse/AMQ-2438
18328	AMQ-2438	Here is the scenario I've tested. 1. started with single broker1 2. clients connected using failover protocol failover:(tcp://broker1:61616) 3. database used by the broker1 goes offline 4. broker1 stops 5. database comes back online After this broker1 never comes back. I am using RAR deployed to JBoss, is there any specific configuration need to be done for broker-config.xml?	1	0	https://issues.apache.org/jira/browse/AMQ-2438
18329	AMQ-2412	I'll check that out, what's the failure you're seeing? That test passes here for me...	1	1	https://issues.apache.org/jira/browse/AMQ-2412
18330	AMQ-2395	Does org.apache.activemq.store.jdbc.Statements#setTablePrefix not suffice?	1	0	https://issues.apache.org/jira/browse/AMQ-2395
18331	AMQ-2390	I just noticed this recently myself, so thanks for creating this issue, Dejan. Another item that added many more files to the ActiveMQ distribution is the inclusion of Dojo for the web console. Is it really necessary to include all of these files?	1	0	https://issues.apache.org/jira/browse/AMQ-2390
18332	AMQ-2386	Support for Byte type messages seems to be broken. If I send a message with a content-length header and any NULL characters I get the following exception: 2010-05-25 12:28:54,652 | DEBUG | Transport failed: java.io.EOFException | org.apache.activemq.broker.TransportConnection.Transport | ActiveMQ NIO Worker java.io.EOFException at java.io.DataInputStream.readFully(DataInputStream.java:180) at java.io.DataInputStream.readFully(DataInputStream.java:152) at org.apache.activemq.transport.stomp.StompWireFormat.unmarshal(StompWireFormat.java:146) at org.apache.activemq.transport.stomp.StompWireFormat.unmarshal(StompWireFormat.java:60) at org.apache.activemq.transport.stomp.StompNIOTransport.serviceRead(StompNIOTransport.java:121) at org.apache.activemq.transport.stomp.StompNIOTransport.access$000(StompNIOTransport.java:49) at org.apache.activemq.transport.stomp.StompNIOTransport$1.onSelect(StompNIOTransport.java:73) at org.apache.activemq.transport.nio.SelectorSelection.onSelect(SelectorSelection.java:94) at org.apache.activemq.transport.nio.SelectorWorker$1.run(SelectorWorker.java:119) at java.util.concurrent.ThreadPoolExecutor$Worker.runTask(ThreadPoolExecutor.java:886) at java.util.concurrent.ThreadPoolExecutor$Worker.run(ThreadPoolExecutor.java:908) at java.lang.Thread.run(Thread.java:619)	1	0	https://issues.apache.org/jira/browse/AMQ-2386
18333	AMQ-2381	How do I update online doc in this regard? Should I?	0	0	https://issues.apache.org/jira/browse/AMQ-2381
18334	AMQ-2365	We intentionally don't add temporary destinations - a lot of broker behaviour works by assuming that the method won't return any. Why do you want the temporary destinations ? - we could provide a work around for your specific use case	0	0	https://issues.apache.org/jira/browse/AMQ-2365
18335	AMQ-2352	Hi, when you use webconsole-properties.xml you should configure your console using system properties. System properties configuration currently allows you to use -Dwebconsole.jms.user and -Dwebconsole.jms.password properties which will be used in created connection factory. As a demonstration I started 5.3.0 broker using conf/activemq-security.xml $ bin/activemq xbeanconf/activemq-security.xml and successfully connected using mvn jetty:run -Dwebconsole.type=properties -Dwebconsole.jms.url=tcp://localhost:61616 -Dwebconsole.jmx.url=service:jmx:rmi:///jndi/rmi://localhost:1099/jmxrmi -Dwebconsole.jms.user=system -Dwebconsole.jms.password=manager Does this works for you? If not, can you clarify a bit more on what are you trying to achieve? Regards Dejan	1	1	https://issues.apache.org/jira/browse/AMQ-2352
18336	AMQ-2352	hi, Where can I get the xbeanconf/activemq-security.xml to give it a try? As far as I remember I could start up using jetty and connect to it using webconsole, but I couldn't send a message to the queues, because the system properties ${webconsole.jms.userName} and ${webconsole.jms.password} do not automatically map to the connectionFactory bean. I hope this helps, Philippe	1	0	https://issues.apache.org/jira/browse/AMQ-2352

18338	AMQ-2352	Hi Philippe, are you sure you don't have 5.2.0 left somewhere in the classpath? I just tried the following and it worked well: 1. Download the 5.3.0 web console war (http://repo2.maven.org/maven2/org/apache/activemq/activemq-web-console/5.3.0/activemq-web-console-5.3.0.war) 2. Copy it to clean jetty install webapps folder 3. Start secured ActiveMQ 5.3.0 (bin/activemq xbean:conf/activemq-security.xml) 4. start jetty (java -Dwebconsole.type=properties -Dwebconsole.jms.url=tcp://localhost:61616 -Dwebconsole.jmx.url=service:jmx:rmi:///jndi/rmi://localhost:1099/jmxrmi -Dwebconsole.jms.user=system -Dwebconsole.jms.password=manager -jar start.jar) 5. use web console at http://localhost:8080/activemq-web-console-5.3.0/ Regards Dejan	1	1	https://issues.apache.org/jira/browse/AMQ-2352
18339	AMQ-2352	The scenario you describe works on my local activemq. However when I try to validate on our deployed activemq here, that also has authentication on jmx, I fail to specify the username and password. Previously (on 5.2.0) I used: -Dwebconsole.jmx.role=username -Dwebconsole.jmx.password=password Apparently in 5.3.0 it is changed to: -Dwebconsole.jmx.user=username -Dwebconsole.jmx.password=password But still I fail to login. Caused by: javax.security.auth.login.FailedLoginException: Invalid username or password at com.sun.jmx.remote.security.FileLoginModule.attemptAuthentication(FileLoginModule.java:432) at com.sun.jmx.remote.security.FileLoginModule.login(FileLoginModule.java:279) at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method) at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:39) at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:25) at java.lang.reflect.Method.invoke(Method.java:585) at javax.security.auth.login.LoginContext.invoke(LoginContext.java:769) at javax.security.auth.login.LoginContext.access$000(LoginContext.java:186) at javax.security.auth.login.LoginContext$5.run(LoginContext.java:706) at java.security.AccessController.doPrivileged(Native Method) at javax.security.auth.login.LoginContext.invokeCreatorPriv(LoginContext.java:703) at javax.security.auth.login.LoginContext.login(LoginContext.java:575) at com.sun.jmx.remote.security.JMXPluggableAuthenticator.authenticate(JMXPluggableAuthenticator.java:173) at sun.management.jmxremote.ConnectorBootstrap$AccessFileCheckerAuthenticator.authenticate(ConnectorBootstrap.ja va:181) at javax.management.remote.rmi.RMIServerImpl.doNewClient(RMIServerImpl.java:212) at javax.management.remote.rmi.RMIServerImpl.newClient(RMIServerImpl.java:179) at sun.reflect.GeneratedMethodAccessor131.invoke(Unknown Source) at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:25) at java.lang.reflect.Method.invoke(Method.java:585) at sun.rmi.server.UnicastServerRef.dispatch(UnicastServerRef.java:294) at sun.rmi.transport.Transport$1.run(Transport.java:153) at java.security.AccessController.doPrivileged(Native Method) at sun.rmi.transport.Transport.serviceCall(Transport.java:149) at sun.rmi.transport.tcp.TCPTransport.handleMessages(TCPTransport.java:466) at sun.rmi.transport.tcp.TCPTransport$ConnectionHandler.run(TCPTransport.java:707) at java.lang.Thread.run(Thread.java:595)	1	0	https://issues.apache.org/jira/browse/AMQ-2352
18340	AMQ-2352	Hi Dejan, I am using AMQ 5.3.0 as embedded broker in Tomcat which works fine. For the admin console, I took the patch for SystemPropertiesConfiguration but the activemq-web-console-5.3.0.war still doesn't work. I pass the JAVA_OPTS="-Dwebconsole.type=properties -Dwebconsole.jms.url=tcp://localhost:61616 -Dwebconsole.jmx.url=service:jmx:rmi:///jndi/rmi://localhost:1099/jmxrmi -Dwebconsole.jmx.user=system -Dwebconsole.jmx.password=manager" as stated in documentation. Am I missing something else for this to work in tomcat. Is the admin webapp tested for embedded broker in tomcat ? Thanks Bhupi	1	0	https://issues.apache.org/jira/browse/AMQ-2352

#	Requirement	Questions	Answered	Successfully Answered	URL
18341	AMQ-2352	Hi Bhupi, there shouldn't be any difference between tomcat-embedded and standalone brokers. Are you sure the patch is applied correctly? You can try switching properties of user and password fields to see if the issue is still there. Also, if your broker is secured (and not jmx), you should use -Dwebconsole.jms.user=system -Dwebconsole.jms.password=manager properties.	0	0	https://issues.apache.org/jira/browse/AMQ-2352
18342	AMQ-2352	I downloaded the webconsole again from this location. http://repo2.maven.org/maven2/org/apache/activemq/activemq-web-console/5.3.0/activemq-web-console-5.3.0.war The fix is not included in that version. Where should I look to download a version that includes the fix? Thanks	0	0	https://issues.apache.org/jira/browse/AMQ-2352
18343	AMQ-2343	Hi, this is an old issue, but I can't find if it was already fixed. How is the progress of it?	1	0	https://issues.apache.org/jira/browse/AMQ-2343
18344	AMQ-2330	Could you add the patch ?	0	0	https://issues.apache.org/jira/browse/AMQ-2330
18345	AMQ-2324	Just wanted to add some more context. This means the Spring Integration {{JmsOutboundGateway.sendAndReceive}} will fail in a multi-broker environment as well. Should this be considered a bug or is it really an Improvement? (In other words, is there a workaround?)	0	0	https://issues.apache.org/jira/browse/AMQ-2324
18346	AMQ-2318	Is there an issue for StoreUsage and TempUsage ?	0	0	https://issues.apache.org/jira/browse/AMQ-2318
18347	AMQ-2245	I see the same stack trace today in 5.3.1 after trying to force start a BrokerService that was stopped. Is there a way to replace the ErrorBroker?	0	0	https://issues.apache.org/jira/browse/AMQ-2245
18348	AMQ-2139	Hi I'm working on servicemix 3 and I had some problems with load testing. I have multiple servicemix instances interconnected together with activemq brokers. After long investigation, and JProbe analyses I found that the pb is on the TcpTransport. So I tried your proposition and it seems to work fine (with a new TcpTransportFactory and a PooledTcpTransport! But I think it's not the best solution when using some big messages because there are only one socket used to communicate between two servicemix containers. My questions are : Is it necessary to have a MutexTransport due to the OpenWireFormat marshall method is already serialized ? Do you think it is possible to create a pool of sockets in the Tcp transport to build a network of brokers ? Thanks	0	0	https://issues.apache.org/jira/browse/AMQ-2139

18352	AMQ-2105	I downloaded activemq-rpm_standalone-project.tar.bz2 unzipped it, built MAVEN_OPTS=-Xmx800m mvn clean install -Dmaven.test.skip=true and it created an RPM [INFO] Installing /opt/junk/activemq-rpm_standalone-project/target/activemq-rpm-5.3-1-SNAPSHOT.rpm to /root/.m2/repository/org/apache/activemq/activemq-rpm/5.3-SNAPSHOT/activemq-rpm-5.3-SNAPSHOT.rpm # ls -l target/activemq-rpm-5.3-1-SNAPSHOT.rpm -rw-r--r-- 1 root root 25722620 Dec 21 09:55 target/activemq-rpm-5.3-1-SNAPSHOT.rpm The RPM says "not relocatable", is there an option available to change this?	0	0	https://issues.apache.org/jira/browse/AMQ-2105
18353	AMQ-2105	I have not used the latest releases of the unix-maven-plugin, but I don't think it currently supports relocatable. Looking at [1], it seems straight forward to add support to unix-m-p. Can you add a jira for it? As far as I can tell ActiveMQ seems "relocatable ready", so it seems doable. In my opinion relocatable is a minor convenience feature, not a blocking issue for adding rpm support to ActiveMQ... [1] http://www.rpm.org/max-rpm/ch-rpm-reloc.html	0	0	https://issues.apache.org/jira/browse/AMQ-2105
18354	AMQ-2105	Hi, thank you for wrining the specfile - i take a quick view at your RPM (just inspected by using cpio): Some ideas/hints from a sysadmin's view: - rpm creation should be automated Maybe you can add activemq to SUSE build service to create RPMs for several plattforms. (see: http://de.opensuse.org/Build_Service) Automatic creation of a daily snapshot based on svn-trunk would be a cool idea. - ActiveMQ persistence data is currently located in /var/cache/activemq - this looks not very LSB compliant. Maybe /var/lib/activemq would be a better way - /etc/activemq should only contain one single configuration (all other activemq-*.xml configurations should be placed in /usr/share/activemq/example/conf) - Basic configuration for the init-script should be moved to /etc/default/activemq - ActiveMQ comes with the java wrapper: /usr/share/activemq/bin/linux-x86-64/libwrapper.so /usr/share/activemq/bin/linux-x86-64/wrapper => it seems that this is the main reason to have separate rpm-archives for different platforms => in my opinion it would be a good idea to deliver activemq as a "noarch" package by using a init-script which do not need a binary helper. (see also my implementation https://issues.apache.org/activemq/browse/AMQ-2453, unluckily i got no feedback what is needed to get it in activemq-svntrunk) => in my opinion it would be a good idea to deliver activemq as a "noarch" package by using a init-script which do not need a binary helper. (noarch packages can i.e. be used on linux-x86/x86_64/s390/arm/.. and also on systems which support rpm like aix/pseries,...) - ActiveMQ should not run as root-user as default I'm also interested in having distribution packages of activemq - if you like i can contribute to the specfiles.... Regards Marc	1	0	https://issues.apache.org/jira/browse/AMQ-2105
18355	AMQ-2105	Hi James, thanks for the great work on this. Can you attach the sources and grant a license for inclusion in Apache project? I'm a bit busy at the moment, but will look at this and related issues (including making start script better) soon. What I'd do as well is to create a PGP signature for it, so its source can be verified (as it is the case with other distributions). Marc, all improvements are welcomed. It'd be great to make ActiveMQ a first-class citizen on Linux.	1	0	https://issues.apache.org/jira/browse/AMQ-2105

#	Requirement	Questions	Answered	Successfully Answered	URL
18356	AMQ-2105	{quote} * rpm creation should be automated Maybe you can add activemq to SUSE build service to create RPMs for several plattforms. (see: http://de.opensuse.org/Build_Service) Automatic creation of a daily snapshot based on svn-trunk would be a cool idea. {quote} Yes, those were just some temp rpms We build it automatically on our Koji (same as fedora) buildserver. Latest version at : [https://koji.afroditi.hellasgrid.gr/koji/packageinfo?packageID=492] {quote} * ActiveMQ persistence data is currently located in /var/cache/activemq - this looks not very LSB compliant. Maybe /var/lib/activemq would be a better way {quote} Yes, probably. Now fixed. {quote} * /etc/activemq should only contain one single configuration (all other activemq-*.xml configurations should be placed in /usr/share/activemq/example/conf) {quote} This seems to be a problem with the upstream tarball creation. In the SVN repo they're in a separate directory and get merged during the build process. I'll submit a patch against the assembly descriptor to change this. {quote} * Basic configuration for the init-script should be moved to /etc/default/activemq {quote} The init.d script loads from /etc/sysconfig/activemq which is the RHEL/fedora equivalent of the debian /etc/default. I currently don't create a /etc/sysconfig/activemq by default. I probably should. {quote} * ActiveMQ comes with the java wrapper: /usr/share/activemq/bin/linux-x86-64/libwrapper.so /usr/share/activemq/bin/linux-x86-64/wrapper => it seems that this is the main reason to have separate rpm-archives for different platforms => in my opinion it would be a good idea to deliver activemq as a "noarch" package by using a init-script which do not need a binary helper. (see also my implementation https://issues.apache.org/activemq/browse/AMQ-2453, unluckily i got no feedback what is needed to get it in activemq-svntrunk) => in my opinion it would be a good idea to deliver activemq as a "noarch" package by using a init-script which do not need a binary helper. (noarch packages can i.e. be used on linux-x86/x86_64/s390/arm/.. and also on systems which support rpm like aix/pseries,...) {quote} Well the different platforms tend to have different rpms anyway since there are differences in how the different platforms lay things out and what is provided for init.d scripts (e.g. start-stop-daemon vs runuser and /etc/default vs /etc/sysconfig. Also we we move to a 'real' rpm built for Fedora from source it'll be x86_64 anyway since it must put the .so files for gcj into the package. Tomcat5 on RHEL uses jakarata-commons-daemon for startup which also has a small binary component. I know there are some licencing problems with JWS which means we can't a newer version - I'll look at a patch to use jakarta-commons-daemon instead and see if it's better. {quote} * ActiveMQ should not run as root-user as default {quote} the rpm creates an 'activemq' user and modifies the init.d to use it by default. Thanks for the feedback, and any modifications you have to make it work on non-RHEL rpm platforms would be welcome ! The latest rpm (5.3.2-3) is here : [https://koji.afroditi.hellasgrid.gr/koji/buildinfo?buildID=623] and I'll attach the tarball of the scripts to this ticket now.	0	0	https://issues.apache.org/jira/browse/AMQ-2105
18357	AMQ-2092	just wondering when this occurs, would it make sense to spit out the toString() of the object? Is it something got to do with how TransportConnection is shutdown?	1	0	https://issues.apache.org/jira/browse/AMQ-2092
18358	AMQ-2040	Is this for browsing messages from the webconsole?	1	0	https://issues.apache.org/jira/browse/AMQ-2040
18359	AMQ-2018	Are you seeing errors when deploying ActiveMQ to the dmServer? I've just deployed both 5.1 and 5.2 to the SpringSource dmServer with any issues.	0	0	https://issues.apache.org/jira/browse/AMQ-2018
18360	AMQ-2006	woo, can you reattach your patch and give it the apache love. that is be sure and indicate that you wish to assign rights to apache.	1	1	https://issues.apache.org/jira/browse/AMQ-2006
18361	AMQ-1978	But do you really want to have the full text in a toString() value? I'd limit it to 60 chars or so.	0	0	https://issues.apache.org/jira/browse/AMQ-1978
18362	AMQ-1978	A hard limit of 60 could be good, better may be something of the form "abc....xyz" so the beginning and the end of the text are visible. need for a limit seems to be reflected in the tests, I see a bunch TextMessage related failures like : ---------- Test set: org.apache.activemq.openwire.v1.ActiveMQTextMessageTest ---------- Tests run: 1, Failures: 0, Errors: 1, Skipped: 0, Time elapsed: 0.046 sec <<< FAILURE! testGenerateAndReParsingIsTheSame(org.apache.activemq.openwire.v1.ActiveMQTextMessageTest) Time elapsed: 0.02 sec <<< ERROR! java.lang.OutOfMemoryError: Requested array size exceeds VM limit at java.lang.AbstractStringBuilder.<init>(AbstractStringBuilder.java:44) at java.lang.StringBuffer.<init>(StringBuffer.java:92) at org.apache.activemq.util.MarshallingSupport.readUTF8(MarshallingSupport.java:320) at org.apache.activemq.command.ActiveMQTextMessage.getText(ActiveMQTextMessage.java:85) at org.apache.activemq.command.ActiveMQTextMessage.toString(ActiveMQTextMessage.java:152) at java.lang.String.valueOf(String.java:2615) at java.lang.StringBuilder.append(StringBuilder.java:116) at org.apache.activemq.openwire.DataFileGeneratorTestSupport.testGenerateAndReParsingIsTheSame(DataFileGeneratorTestSupport.java:97) at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method) at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:39) at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:25) at java.lang.reflect.Method.invoke(Method.java:585) at junit.framework.TestCase.runTest(TestCase.java:154) at junit.framework.TestCase.runBare(TestCase.java:127) at junit.framework.TestResult$1.protect(TestResult.java:106) at junit.framework.TestResult.runProtected(TestResult.java:124) at junit.framework.TestResult.run(TestResult.java:109) at junit.framework.TestCase.run(TestCase.java:118) at junit.framework.TestSuite.runTest(TestSuite.java:208) at junit.framework.TestSuite.run(TestSuite.java:203) at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method) at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:39) at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:25) at java.lang.reflect.Method.invoke(Method.java:585) at org.apache.maven.surefire.junit.JUnitTestSet.execute(JUnitTestSet.java:210) at org.apache.maven.surefire.suite.AbstractDirectoryTestSuite.executeTestSet(AbstractDirectoryTestSuite.java:135) at org.apache.maven.surefire.suite.AbstractDirectoryTestSuite.execute(AbstractDirectoryTestSuite.java:160) at org.apache.maven.surefire.Surefire.run(Surefire.java:81) at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method) at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:39) at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:25) at java.lang.reflect.Method.invoke(Method.java:585)	1	1	https://issues.apache.org/jira/browse/AMQ-1978

#	Requirement	Questions	Answered	Successfully Answered	URL
18363	AMQ-1928	Hi, Could you please let us know what is the time line of providing the exception for clients? If I interpret "Fix Version/s: 5.4.0" correctly then, this means to be fixed in 5.4.0. What would be an approximate date for the release? We see there still no proper exception for client in apache-activemq-5.3.1, when setting this <transportConnector name="openwire" uri="tcp://0.0.0.0:61616?maximumConnections=2"/> after sometime client just bails out with javax.jms.JMSException: Wire format negotiation timeout: peer did not send his wire format. Will it work for STOMP as well? Thank you, Konstantin	1	0	https://issues.apache.org/jira/browse/AMQ-1928
18364	AMQ-1919	FWIW the current code just swaps SESSION_TRANSACTED to be AUTO_ACKNOWLEDGE which seems even worse?	1	0	https://issues.apache.org/jira/browse/AMQ-1919
18365	AMQ-1894	Attached patch (configuration.patch) is a proposal for new configuration files for 5.3.0. First of all it trims down the default configuration as Bruce proposed. I also set kahaDB as a default persistence mechanism for 5.3.0. Next we have camel and jetty configurations pulled out into separate configuration files activemq-camel.xml and activemq-jetty.xml so that they can be easily imported into other configuration files. Currently inclusion of both of these files are commented in default configuration and I guess the first question is whether we want to keep it that way. activemq-demo.xml is pretty much the same as the current configuration file, but with kahaDB and producer flow control explicitly turned on. I created some more configuration examples. They are all located assembly/src/sample-conf. I renamed and modified some of the existing ones (network examples - thanks Andreas) and added some more. All files with activemq-*.xml pattern from that folder are included into conf folder of the distribution. There are some other files there, that I think are outdated, so we should probably remove them (another debating question) Here is the list of new configuration examples: activemq-jdbc.xml - demonstrates jdbc storage activemq-security- demonstrates secured broker activemq-command - demonstrates command agent and xmpp protocol activemq-static-network-broker1.xml and activemq-static-network-broker2.xml - demonstrates static network setup activemq-dynamic-network-broker1.xml and activemq-dynamic-network-broker2.xml - demonstrates multicast network setup shared file system master slave can be demonstrated using the default configuration file. What would be good to have as well: activemq-scalability.xm and activemq-throughput.xml which will show how to tune broker for these two use cases. I'll start working on them now. Please post your comments on these. If there are no major objections, we can start by committing this patch and working further on polishing them up. More comments in the files and wiki documentation would be great. Cheers	0	0	https://issues.apache.org/jira/browse/AMQ-1894
18366	AMQ-1888	is /schemas/ relevant past 5.0? /schema/ (note singular) has the necessary files for 5.x /schemas/ is a link to the m1 repo, I guess we could copy the relevant files to the m2 repo in a similar location but I wonder who references /schemas/ ?	1	0	https://issues.apache.org/jira/browse/AMQ-1888
18367	AMQ-1853	It is nice that there will finally be done something about this problem, eventhough I am not sure exactly that it is the same problem as I have been struggling with. This issue talks about the problem occuring if just on message is to be redelivered. The problem I have, only completely blocks delivery of new fresh messages, when there is more than maxMessagesPerSessions * maxSessions messages waiting for redelivery on the same consumer at the same time. I am using MDBs in Glassfish v2.1 as the consumer - maybe that makes the difference. For those with access - see more on https://fusesource.com/issues/browse/DEV-2279. Will this fix also solve my problem? Regards, Per Steffensen	1	0	https://issues.apache.org/jira/browse/AMQ-1853
18368	AMQ-1853	I see a problem. I downloaded AMQ 5.6-SNAPSHOT, configured it and my ConnectionFactory (wrapped) bean looks like this: <bean id="jmsConnectionFactory" class="org.apache.activemq.pool.PooledConnectionFactory" destroy-method="stop"> <property name="connectionFactory"> <bean class="org.apache.activemq.ActiveMQConnectionFactory"> <property name="brokerURL"> <value>${jms.broker.urls}</value> </property> <property name="redeliveryPolicy"> <bean class="org.apache.activemq.RedeliveryPolicy"> <property name="maximumRedeliveries" value="4"/> <property name="initialRedeliveryDelay" value="3000"/> <property name="useExponentialBackOff" value="true"/> <property name="backOffMultiplier" value="2"/> </bean> </property> <property name="nonBlockingRedelivery" value="true" /> </bean> </property> </bean> The problem is that if 'nonBlockingRedelivery' is set to TRUE AFTER RedeliveryPolicy property, redelivering takes much more time than specified in RedeliveryPolicy object properties. On the other hand - while 'nonBlockingRedelivery' is put BEFORE declaration od RedeliveryPolicy - it takes under consideration only 'maximumRedeliveries' property - but with no delay and multiplier. That makes whole redelivery thing totally wrong - i got defult 6 requests one by one. Is this normal and expected behaviour? How can I achieve taking redeliveryPolicy properties to run?	0	0	https://issues.apache.org/jira/browse/AMQ-1853
18369	AMQ-1853	Is the URL parameter for this nonBlockingRedelivery=true, jms.nonBlockingRedelivery=true, jms.redeliveryPolicy.nonBlockingRedelivery=true, or something else entirely? (*Chris*)	1	0	https://issues.apache.org/jira/browse/AMQ-1853
18370	AMQ-1832	2ying Do you think your patch can solve my problems AMQ-1825 ?	0	0	https://issues.apache.org/jira/browse/AMQ-1832
18371	AMQ-1832	I think your solution is bad. How can I stop Master? Stopping working master means that my business process will crashed... What's the problem if it is just a network problem, not server crashing? In this case slave must automaticaly reconnect to master and replicate state, it mustn't shutdown. Data replication must be independent from Command architecture... Propogating commands to slave is bad architecture. In fact, absense of command means absence of data replication.	0	0	https://issues.apache.org/jira/browse/AMQ-1832
18372	AMQ-1804	Reopening ticket due to xbean name mapping conflict that may cause problems for some users. I propose either removing the xbean mapping from the org.apache.activemq.ActiveMQConectionFactory class or removing the org.apache.activemq.spring.ActiveMQConnectionFactory class. Do we need both of these classes?	1	0	https://issues.apache.org/jira/browse/AMQ-1804
18373	AMQ-1757	It seems we missed September. What needs to be done now and how can I help?	1	0	https://issues.apache.org/jira/browse/AMQ-1757
18374	AMQ-1732	Would it be possible to add an ack mode to acknowledge all messages since last ack'ed message (but not all those delivered), sort of like a sliding window protocol?	1	0	https://issues.apache.org/jira/browse/AMQ-1732
18375	AMQ-1689	BTW.. not 100% sure how much this will help. So lets say that sync call is taking a long time to complete.. the client writes will start gettting batched up in the next batch.. then by the time the sync completes the next write batch it gets will be > 1 since several calls should have batched up.	0	0	https://issues.apache.org/jira/browse/AMQ-1689
18376	AMQ-1676	Hi Joseph when you attached the patch you did not click on the option that states you grant the ASF a ASL 2.0 license on your patch. We can't commit this change until you re-attach and click that option.	0	0	https://issues.apache.org/jira/browse/AMQ-1676

#	Requirement	Questions	Answered	Successfully Answered	URL
18377	AMQ-1660	Perhaps it would be better if we try to work around this problem with postgress so that you don't have to restart your broker. (and if you did I would recommend you just use a cron job to do that). Wonder if we use 2 lock statements in 2 different transactions. After some time we commit transaction 1 and get the lock again. Then we do the same with the 2nd transaction. and keep alternating. This should avoid the old transaction problem. We just need to deal with new brokers coming online and getting 1 of the locks while the master is re-newing the lock. So a salve need to release that lock fast if it can't get the 2nd lock. Make sense?	0	0	https://issues.apache.org/jira/browse/AMQ-1660
18378	AMQ-1657	The documentation explicitly does state that a configuration of multiple brokers, which are aware of each other, must be uniquely named. Is this an issue in 5.3? It is very easy to do this, dynamically or hard-coded, so I don't know whether new handling is merited here although I could easily argue that elegant or helpful handling is not a bad idea.	0	0	https://issues.apache.org/jira/browse/AMQ-1657
18379	AMQ-1614	The fix provided in patch is not 100% complete. PooledConnectionFactory provides following 3 constructors: 1. PooledConnectionFactory() 2. PooledConnectionFactory(ActiveMQConnectionFactory connectionFactory) 3. PooledConnectionFactory(String brokerURL) The New class AmqJNDIPooledConnectionFactory fixes JNDI problem but though this class extends PooledConnectionFactory, it is provided with support for zero argument constructor. Can you please provide all 3 constructors for AmqJNDIPooledConnectionFactory class and release patch again?	1	0	https://issues.apache.org/jira/browse/AMQ-1614
18380	AMQ-1609	The question is what would an example STOMP frame look like with type info in it?	0	0	https://issues.apache.org/jira/browse/AMQ-1609
18381	AMQ-1587	Please apply at your leisure. BTW, I'm trying to update (i.e. resize) the images on the Confluence related to this patch. I am unable to delete overwrite my previous uploaded images. Do I need better karma for this? :) I posted a thread about this below. see: http://www.nabble.com/Confluence-Image-Removal-Replacement-td15701101s2354.html	1	1	https://issues.apache.org/jira/browse/AMQ-1587
18382	AMQ-1587	patch applied in rev 645580. Thx! Not sure what the problem is with confluence.. could you rename and upload the images? Perhaps that would be the simple work around?	1	0	https://issues.apache.org/jira/browse/AMQ-1587
18383	AMQ-1567	Thanks. New version of the patch works great. Comment on the actual functionality of the patch: would it be possible that if a transform were not supplied on a stomp subsription, that the message would automatically be translated back to text per the supplied transformation? At the moment, map messages / object messages come back with an empty body if the subscriptions has not supplied a transform. They should probably translate the message backwards to it's closest approximation of the original sent text.	0	0	https://issues.apache.org/jira/browse/AMQ-1567
18384	AMQ-1567	This is the behavior of the legacy transformer. I have on my todo list to add the transformation-error header in case that specified transformer is not found and we can handle somehow this situation too. I also want to make a cache of translators, so we don't have to make one so often. I've planed to make another patch for these functionalities, but I can do it in this one as well (probably in the next few days). I'm not sure what transformation should be used to transform map and object messages to text by default. Do you have any suggestions? Maybe to use xml transformation by default? As for the Jettison driver, can you provide some examples (test cases) so I can reproduce it. I think this is the easiest way to do it, and of course we can fix Jettison bugs and consistency issues (it is a simple Stax driver).	0	0	https://issues.apache.org/jira/browse/AMQ-1567
18385	AMQ-1516	Please submit a patch if you think it'll help. Wanna create a patch against trunk?	1	0	https://issues.apache.org/jira/browse/AMQ-1516
18386	AMQ-1513	Rob, can you commit this please?	1	1	https://issues.apache.org/jira/browse/AMQ-1513
18387	AMQ-1513	is the intention of the patch to split the options between producer and consumer? seems like the patch was partially applied but there is no say 'Consumer' options section, just options. If you have a moment, would it be possible to capture another diff against trunk of exactly what you want?	1	1	https://issues.apache.org/jira/browse/AMQ-1513
18388	AMQ-1493	Hey Dejan, when you attached the patch you did not select the "ASF Granted License" option. Could you just confirm real quick that you are contributing this to the ASF under the ASL 2.0 lic? Thanks!	0	0	https://issues.apache.org/jira/browse/AMQ-1493
18389	AMQ-1492	Can we resolve this now Claus?	1	1	https://issues.apache.org/jira/browse/AMQ-1492
18390	AMQ-1477	With this change, my MulticastDiscoveryAgent will only get "localhost" as the broker name no matter what value I set in broker's activemq.xml Is this a bug? My application is broken when upgrading from 4.1.1 to 5.x @@ -398,7 +353,7 @@ if (selfService != null) { String payload = getType(); payload += started.get() ? ALIVE : DEAD; - payload += DELIMITER + brokerName + DELIMITER; + payload += DELIMITER + "localhost" + DELIMITER; payload += selfService; try { byte[] data = payload.getBytes();	0	0	https://issues.apache.org/jira/browse/AMQ-1477
18391	AMQ-1476	Why don't you reconfigure the logging, so that only errors from the org.apache.activemq.store.jdbc.DefaultDatabaseLocker category are logged? I think that's the fastest way to get rid of the problem, it doesn't even require a recompilation. The addition of the line log4.logger.org.apache.activemq.store.jdbc.DefaultDatabaseLocker=WARN to the log4j.properties in the conf folder of ActiveMQ should do the job (I didn't test this).	1	0	https://issues.apache.org/jira/browse/AMQ-1476
18392	AMQ-1470	Any idea if this will be fixed for the 4.x release? If so, what does the timeline look like?	0	0	https://issues.apache.org/jira/browse/AMQ-1470
18393	AMQ-1377	hi Dan!! i am using your latest updated amq.js file with cook's prototype file and eliminate the amq_prototype_adapter.js.. the problem is that when i want to call AjaxServlet with the following code Ajax.Request(uri, { method: 'post', postBody: body, onSuccess: org.activemq.Amq.endBatch}); then the AjaxServlet does not get called? Could u plz tell me any solution and review my attached amq.js? Thanks	1	0	https://issues.apache.org/jira/browse/AMQ-1377
18394	AMQ-1377	hi dan!! Could u please explain me vat does following means? var sendPoll = function() { // Workaround IE6 bug where it caches the response // Generate a unique query string with date and random var now = new Date(); var data = 'timeout=' + timeout * 1000 + '&d=' + now.getTime() + '&r=' + Math.random(); var options = { method: 'get', data: data, success: pollHandler, error: pollErrorHandler}; adapter.ajax(uri, options); }; u'hv already set 25 sec that the long-polling socket will stay connected. does it mean u r going to set 25000 secs for timeout parameter which seems quite unrealistic.. iam confused.. by using ur file the following scenerio occurs: 1. ActiveMQ and tomcat running on my machine and if i disabled network connection from my machine the pooling doesnt break, js continously send request for message to MessageListenerServlet 2. but other machines running same application through my IP stop sending sending requests to servlet means polling breaks here, and on the establishment of network again js become able to send request to servlet and response also come back to activeMQ but pooling doesnt occur so that js fail to get response from servlet.. hope i explain the possible scenario.? Thanks	1	0	https://issues.apache.org/jira/browse/AMQ-1377

18395	AMQ-1377	hi dan!! Could u please explain me vat does following means? var sendPoll = function() { // Workaround IE6 bug where it caches the response // Generate a unique query string with date and random var now = new Date(); var data = 'timeout=' + timeout * 1000 + '&d=' + now.getTime() + '&r=' + Math.random(); var options = { method: 'get', data: data, success: pollHandler, error: pollErrorHandler}; adapter.ajax(uri, options); }; u'hv already set 25 sec that the long-polling socket will stay connected. does it mean u r going to set 25000 secs for timeout parameter which seems quite unrealistic.. iam confused.. by using ur file the following scenerio occurs: 1. ActiveMQ and tomcat running on my machine and if i disabled network connection from my machine the pooling doesnt break, js continously send request for message to MessageListenerServlet 2. but other machines running same application through my IP stop sending sending requests to servlet means polling breaks here, and on the establishment of network again js become able to send request to servlet and response also come back to activeMQ but pooling doesnt occur so that js fail to get response from servlet.. hope i explain the possible scenario.?	1	0	https://issues.apache.org/jira/browse/AMQ-1377
18396	AMQ-1377	The timeout parameter takes milliseconds, so the multiplication by 1000 converts to seconds. It is not 25000 seconds, but 25000 milliseconds, which is 25 seconds. The other parameters ('d' and 'r') are just added to make the query string unique. IE6 has a bug where it will not refetch the exact query it has seen before over GET and instead shows you the cached result (regardless of any no-cache directives from the server). I'm not sure what your problem is. Like I said, this has been working fine in my app for nearly 6 months. You will need to debug your own unique scenario, I suggest using the firebug plugin, setting breakpoints in the scripts and seeing what is happening. The only thing that comes to mind is that if you are actually terminating the Tomcat server, that is a very different thing than a client having intermittent connectivity. My solution is really just to handle the network cable getting unplugged or the wifi being flaky, it is not designed to handle a server restart. When you restart the server, the session that your client had (and any topic subscriptions) are probably no longer valid, and so the client may need to make a new request for the topic..... maybe something like this: //Un-Listen from topic org.activemq.Amq.removeListener("yourTopic", "topic://Your.Topic"); //One second delay to wait for the Un-Listen to happen //Then Re-Listen setTimeout(function(){ org.activemq.Amq.addListener("yourTopic", "topic://Your.Topic", yourHandler); }, 1000);	1	0	https://issues.apache.org/jira/browse/AMQ-1377
18397	AMQ-1377	hi Dan!! I have added your's modified amq.js files in my application, its work quite fine. Thanks. I want to know one thing is there any impact of pooling on activeMQ performance? Actually ActiveMQ got disconnected after giving the following exception at console "Could not accept connection : Channel was inactive for too long" and also i got this exception in application log: "Uncategorized exception occured during JMS processing; nested exception is javax.jms.JMSException: Could not connect to broker URL: tcp://localhost:61616. Reason: java.net.ConnectException: Connection refused; nested exception is java.net.ConnectException: Connection refused" I wonder due to pooling ActiveMQ becomes slower than Ajax client, is it true or my misconception? Thanks	0	0	https://issues.apache.org/jira/browse/AMQ-1377
18398	AMQ-1377	Is it on purpose that amq.js starts with a poll, even before you have the chance of setting up a listener? This usually means a client initially has to wait "timeout" seconds without having a chance of receiving something.	1	1	https://issues.apache.org/jira/browse/AMQ-1377
18399	AMQ-1377	Arjan, I created an example that successfully used the prototype adapter. I then tried to use your new dojo adapter but did not have much success. Whenever I add a listener it does the POST operation but the polling terminates shortly after. The current poll finishes; but a new one does not start. It seems that the dojo.xhrGet does not get a chance to do its callback to keep the polling alive. Did you have any issues with your dojo adapter?	0	0	https://issues.apache.org/jira/browse/AMQ-1377
18400	AMQ-1377	Dejan any advice on why I could not get this to work? Thanks	1	1	https://issues.apache.org/jira/browse/AMQ-1377
18401	AMQ-1377	is there an eta for the 5.4 release that will contain this fix?	1	0	https://issues.apache.org/jira/browse/AMQ-1377
18402	AMQ-1377	Nathanael, there's no hard date on 5.4 release, we're working hard on making it happen in the next couple of months. Mark, can you post your client code and configuration to the user forum? Cheers	1	0	https://issues.apache.org/jira/browse/AMQ-1377
18403	AMQ-1361	This needs to be rolled back - can the patches be resubmitted but with Apache licence headers please ?	0	0	https://issues.apache.org/jira/browse/AMQ-1361
18404	AMQ-1281	This fix wouldn't happen to all fix the queue browser problem in the Web Console? Even when using the Web Console within ActiveMQ, if all of the destinations are password protected, the Web Console will crash horribly if you try to browse a queue, with the following error. I think your patch won't help, because it seems that the queue browser is using JMS, not JMX. org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'queueBrowser' defined in ServletContext resource [/WEB-INF/webconsole-embedded.xml]: Instantiation of bean failed; nested exception is org.springframework.beans.BeanInstantiationException: Could not instantiate bean class [org.apache.activemq.web.QueueBrowseQuery]: Constructor threw exception; nested exception is javax.jms.JMSException: User name or password is invalid. 18406	AMQ-1273	We have exact same problem in our application at the moment, i'm trying an approach where i am starting the broker in the separate thread. any other tips i can use? is there a patch available for this feature?	1	0	https://issues.apache.org/jira/browse/AMQ-1273

#	Requirement	Questions	Answered	Successfully Answered	URL
18407	AMQ-1241	Since I don't want to be the mean guy I actually did something about it :) The attached patch allows 3 modes of operation, chosen via a VM-Flag (webconsole.type) * jndi (default): Gets a connection factory from "jms/connectionFactory" and the jmx-connection-string (f.e. service:jmx:rmi:///jndi/rmi://localhost:1099/jmxrmi) from "jmx/url" * properties: Uses the system properties webconsole.jms.url and webconsole.jmx.url for the urls of the JMS resp. JMX connectors of the broker * invm: Uses BrokerRegistry.findFirst() for the broker (fixes the current bug with custom named brokers) All modes support the following (well, the invm-mode doesn't really^^): * jmx-Failover: Syntax: <url1>, <url2>, <url3>, ... (f.e. "service:jmx:rmi:///jndi/rmi://serverA:1099/jmxrmi, service:jmx:rmi:///jndi/rmi://serverB:1099/jmxrmi") that chooses the first available broker * jms-Failover: Standard behaviour of the connectionfactory, no code changed Other things changed: * Fixed the handling of the 'query'-object in the request-context of spring (was bugged before, they wouldn't get cleaned up at the end of the request, leading to leftover open consumers) * removed any direct usage of vm://localhost since that often leaded to not-wanted broker startups * explicit initialization of the WebClient class (so it'd use the right ConnectionFactory) * Changed the WebClient to use the JMS-classes instead of the ActiveMQ specific ones (removes problems with application-server-provided session/connection pooling) Things that don't work yet or are missing: * QueueBrowserServlet: This class does own connection handling and creating. I couldn't find out why it'd do that, but I didn't dare doing a that deep change. So atm the RSS/Atom feeds are broken in the web-console * running the war inside the broker (former standard-configuration) doesn't work due to classloader issues (specific: BrokerRegistry is twice in the classpath). I'd suggest to reconfigure the jetty classloading or to remove the active-mq jars from the 'in-broker-war'. * the patch misses the change to the startup-scripts to set the system-property "webconsole-type" to invm * documentation (apart from this here) I'd be happy to discuss this change with you guys and get some input about the changes I made. I don't look at them at finished now, but as a step in the direction. Thanks and greetings Mario	1	1	https://issues.apache.org/jira/browse/AMQ-1241
18408	AMQ-1238	Hi Hiram, Can you take a look at this? I'm not a linux/debian expert so I can't verify it. :)	1	0	https://issues.apache.org/jira/browse/AMQ-1238
18409	AMQ-1237	- The idea is to use one "conf/credentials.properties" file which will define activemq.username and activemq.password properties used to create a connection to a broker from console - By default, the connection is always created with system/manager credentials, but that can be changed at one place for all connections - TODO: add the similar support for command agent and camel context (check if there's any other possible connections) so that broker can start all its services when secured	1	1	https://issues.apache.org/jira/browse/AMQ-1237
18410	AMQ-1204	The class activemq-core/src/main/java/org/apache/activemq/store/jdbc/adapter/SybaseDBCAdapter.java was created to resolve this issue. However there is a TYPO in the name of the class: it should be SybaseJDBCAdapter instead of SybaseDBCAdapter Otherwise, it cannot be automatically discovered. Additionally, this class is not included in the latest 4.2.0 snapshot. Could you please include?	1	1	https://issues.apache.org/jira/browse/AMQ-1204
18411	AMQ-1191	What is the current status of this issue? I would like to use Master/Slave failover together with a MS SQL 2005 installation. From reading different issues linking to this problem I am not getting a clear picture if this is or will be resolved.	0	0	https://issues.apache.org/jira/browse/AMQ-1191
18412	AMQ-1191	modified the database locker code to iterate on a result set if one is present, committed in r787990 The logic is conditional on getMetaData returning null if the lock statement will not result in a ResultSet, some don't. Can you verify that this works with your driver?	1	1	https://issues.apache.org/jira/browse/AMQ-1191
18413	AMQ-1157	Hello, I downloaded yesterday the 5.0-Snapshot soruce and debugged (cause I run into the same problem) ... even if above mentioned changes are applied still another change is missing: Class: AbstractRegion.java Method: start() Here you find this: ConnectionContext context = new ConnectionContext(); context.setBroker(broker.getBrokerService().getBroker()); context.getBroker().addDestination(context, dest); Also here the SecurityContext need to be added: context.setSecurityContext(SecurityContext.BROKER_SECURITY_CONTEXT); ConnectionContext context = new ConnectionContext(); context.setBroker(broker.getBrokerService().getBroker()); context.setSecurityContext(SecurityContext.BROKER_SECURITY_CONTEXT); context.getBroker().addDestination(context, dest); Can this be made soon?	1	0	https://issues.apache.org/jira/browse/AMQ-1157
18414	AMQ-1127	Is this still an issue do you think Tim?	1	0	https://issues.apache.org/jira/browse/AMQ-1127
18415	AMQ-1091	So, shouldn't this result in a download option for source on the AMQ 4.1 download page?	1	0	https://issues.apache.org/jira/browse/AMQ-1091

18417	AMQ-1082	Hi Albert, Is this still the case ? I'm sure this was fixed a week or so ago cheers, Rob	1	0	https://issues.apache.org/jira/browse/AMQ-1082
18418	AMQ-1023	The change to TopicSubscription looks ugly. Is there some reason that this information is not updated for all destinations. Also couldn't singleDestination simply replaced by a null check?	0	0	https://issues.apache.org/jira/browse/AMQ-1023
18419	AMQ-1008	James.Strachan wrote: > As for the temporary queue/topic, the JMS[1] spec states that temporary > queues/topics may be used by any session using that connection. This seems >> sensible and should probably be a mechanism embraced by STOMP. If connecting >> to an ActiveMQ server, then the destinations /temporary/queue/foo, or >> /queue/temp/foo would be nice. >Yeah. I guess the decision needs to be, does the client make up some >name and have the broker auto-create it, or should there be an >explicit CREATE/DESTROY type verbs on the STOMP protocol. An explicit client request to CREATE temporary queue/topic where the server creates and return via CREATED frame would have been be ideal. One possible server side implementation could associate the temp queue/topic to the session, and automatically deletes it when session ends which is consistent JMS side behavior. I suggested this a while back but the consensus was not to change the stomp protocol, rather extend it for ActiveMQ. Thus, I have proposed a simple temp queue/topic naming convention which doesn't require the Stomp protocol change or extension: destination: /tempqueue/Foo or destination: /temptopic/Bar This temp destination must be globally unique name as in the case of JMS side. And the server somehow associates the temp queue/topic to the session, and deletes it without a client request when the session ends. Mostly a temp queue is created so that it can be used for replyTo. >I guess the simplest thing that could possibly work is just to use a >naming convention; that /temporary/queue/* (or /tempqueue/*) indicates >temporary queues. Though the complication then arises that a client >may wish to specify the reply-to destination (more here >http://incubator.apache.org/activemq/stomp.html) - which if there was >a client side alias (/tempqueue/foo) that would need to get switched >to the globally unique queue name. I prefer /tempqueue/Foo, /temptopic/Bar type convention which quite similar to regular queue/topic: /queue/Foo, /topic/Bar >I'm not sure how useful the SESSION is; as folks can use a transaction >for a session? A stomp connection can be viewed as an implicit session. Having multiple session within a stomp connection may introduce complexity -Sileshi	1	0	https://issues.apache.org/jira/browse/AMQ-1008
18420	AMQ-984	a few years later but BrokerService has an isSlave() method, Explosing that readonly attribute would give the same information I guess. It will only be true while waiting for the lock, when the lock is acquired it will be false. Would this suffice?	0	0	https://issues.apache.org/jira/browse/AMQ-984
18421	AMQ-982	Hi, There is no authenticated connection documentation for embedded broker either. Following information may help. ---------- How to enable authentication for embedded broker? - Download activemq-jaas-x.x.x.jar and add to the CLASSPATH - Create conf directory and add to the CLASSPATH - Put login.config into conf directory - Put users.properties and groups.properties into conf\org\apache\activemq\security - Use following code for initializing the embedded broker // Server initialization BrokerService broker = new BrokerService(); broker.addConnector("tcp://localhost:61616"); broker.setPlugins(new BrokerPlugin[] { new JaasAuthenticationPlugin () }); broker.start();	1	0	https://issues.apache.org/jira/browse/AMQ-982
18422	AMQ-982	Thanks for this Ali, its awesome! BTW the entire website is a wiki so you can edit or add any information there directly... http://activemq.apache.org/how-does-the-website-work.html http://activemq.apache.org/how-do-i-edit-the-website.html do you fancy adding your documentation changes directly to the wiki? You'll then get more credit for your work as you'll be seen as the contributor to the documentation. You can attach files to wiki pages too	1	0	https://issues.apache.org/jira/browse/AMQ-982
18423	AMQ-943	Hey Dejan, when you attached the patch you did not select the "ASF Granted License" option. Could you just confirm real quick that you are contributing this to the ASF under the ASL 2.0 lic?	0	0	https://issues.apache.org/jira/browse/AMQ-943

#	Requirement	Questions	Answered	Successfully Answered	URL
18424	AMQ-912	Hi Sepand, I reviewed the patch and I noticed that the standard apache licence header is not on the new files included in the patch. Could you please add the headers and create a new diff? Thanks, Hiram	1	1	https://issues.apache.org/jira/browse/AMQ-912
18425	AMQ-912	Hi Sepand, After I apply the latest patch, there's a build failure in the Qdox stuff when I run mvn package. What did you have to do to resolve that before? Any ideas? Thanks, -Kelly java.lang.ArrayIndexOutOfBoundsException: 0 at org.apache.xbean.spring.generator.QdoxMappingLoader.loadElements(QdoxMappingLoader.java:147) at org.apache.xbean.spring.generator.QdoxMappingLoader.loadNamespaces(QdoxMappingLoader.java:107) at org.apache.xbean.spring.generator.QdoxMappingLoader.loadNamespaces(QdoxMappingLoader.java:101) at org.apache.xbean.maven.XBeanMojo.execute(XBeanMojo.java:153) at org.apache.maven.plugin.DefaultPluginManager.executeMojo(DefaultPluginManager.java:412) at org.apache.maven.lifecycle.DefaultLifecycleExecutor.executeGoals(DefaultLifecycleExecutor.java:534) at org.apache.maven.lifecycle.DefaultLifecycleExecutor.executeGoalWithLifecycle(DefaultLifecycleExecutor.java:475) at org.apache.maven.lifecycle.DefaultLifecycleExecutor.executeGoal(DefaultLifecycleExecutor.java:454) at org.apache.maven.lifecycle.DefaultLifecycleExecutor.executeGoalAndHandleFailures(DefaultLifecycleExecutor.java:306) at org.apache.maven.lifecycle.DefaultLifecycleExecutor.executeTaskSegments(DefaultLifecycleExecutor.java:273) at org.apache.maven.lifecycle.DefaultLifecycleExecutor.execute(DefaultLifecycleExecutor.java:140) at org.apache.maven.DefaultMaven.doExecute(DefaultMaven.java:322) at org.apache.maven.DefaultMaven.execute(DefaultMaven.java:115) at org.apache.maven.cli.MavenCli.main(MavenCli.java:256)	1	0	https://issues.apache.org/jira/browse/AMQ-912
18426	AMQ-908	Here are the Geronimo ones: [GeronimoUserPrincipal|http://svn.apache.org/viewvc/geronimo/server/trunk/modules/geronimo-security/src/main/java/org/apache/geronimo/security/realm/providers/GeronimoUserPrincipal.java?view=markup] [GeronimoGroupPrincipal|http://svn.apache.org/viewvc/geronimo/server/trunk/modules/geronimo-security/src/main/java/org/apache/geronimo/security/realm/providers/GeronimoGroupPrincipal.java?view=markup] I'm sure Glassfish has some too, though I don't know where. Perhaps Harmony as well? My assumption was that we should look for a constructor with a single String, and if we don't find that, look for an empty constructor and a setName method that takes a single String, and if we don't find that, throw an Exception. If someone complains that they got the exception, then I guess we'll look at their principal classes to determine the next fallback position. :)	0	0	https://issues.apache.org/jira/browse/AMQ-908
18427	AMQ-892	The JMX RMI port can be set in ActiveMQ 4.x using the JMX system properties. See the [How can I monitor ActiveMQ? page|http://activemq.org/site/how-can-i-monitor-activemq.html#HowcanImonitorActiveMQ-AdvancedJMXConfiguration] under the Advanced JMX Configuration heading. If the com.sun.management.jmxremote.port system property is set within the SUNJMX environment variable, the ActiveMQ start script will pick it up and pass it to the JVM.	0	0	https://issues.apache.org/jira/browse/AMQ-892
18428	AMQ-877	I tried to apply this patch to the current trunk and it broke test cases. I wonder if trunk has moved along a bit since your patch. Could you try create another patch please and we can try again? Do the test cases all work for you with your patch applied?	0	0	https://issues.apache.org/jira/browse/AMQ-877
18429	AMQ-868	I might be missing something but the only CMS code I know of is under the activemq-cpp space in SVN which is current and tagged release work. Are you referring to the CPP clients that exist in sandbox?	0	0	https://issues.apache.org/jira/browse/AMQ-868
18430	AMQ-855	> e.g. if we did implement prefetch of zero - which means don't deliver a message to a consumer at all - > unless they perform a consumer.receive() - even then, the consumer could then hang/deadlock and never > actually acknowledge or process the message. If consumer hangs and message is not processed is a different problem. Even if messages are lost in such case, nobody would blame AMQ. If you kill consumer and re-despatch, it would be brilliant. But if my consumers do not hang, crash or burn, can I just get my messages? James, could you please re-open this issue? I spend 1 month working on this project and now I will have to throw it all away and do explaining with my manager. I cannot apply my own fix, you will not fix it. What am I supposed to do now?	1	1	https://issues.apache.org/jira/browse/AMQ-855
18431	AMQ-855	James, I added implementation of pulling consumer whereby pullMessage() returns a response. Could you please browse through it and give me a feedback? Patches are for file versions PrefetechSubscription.java 1.15 and 1.22 ActiveMQMessageConsumer.java Current implementation does not work for me, because when recieve(long) call times out the prefetch window is increasing and we are back to where we started. Thanks a lot.	1	1	https://issues.apache.org/jira/browse/AMQ-855
18432	AMQ-855	'm going to start looking into it today. I may not use the DataResponse to return the message right away. I think I would still prefer to use the normal message dispatching flow and logic. What I'm thinking is that on timeout, or when receiveNoWait() is called, and no message has arrived to be dispatched, we dispatch a message to the consumer letting it know that no message was available. Then it can unblock. The nice thing about this is that you don't get timing issues between the client and server where the client times out but the broker actually dispatched the message.	1	1	https://issues.apache.org/jira/browse/AMQ-855
18433	AMQ-838	I haven't looked through the code for this at all yet, but maybe an option to force the deletion would be enough? Can someone at least provide a stack trace for this problem?	1	0	https://issues.apache.org/jira/browse/AMQ-838
18434	AMQ-827	That's kind of silly. :) What's wrong with suffixes, which are pretty pervasive at this point? :) Heck, anyone accustomed to configuring a Java heap knows that 100m means 100MiB. I think it's a lot more intuitive.	0	0	https://issues.apache.org/jira/browse/AMQ-827
18435	AMQ-826	Thanks James! How can I see the files? I saw test resources on SVN (properties, ldif, xml) but no Java files. What is the next step in actually using this module? How do I build AMQ with this? I'll try to solve ApacheDS issue you reported. I'll be using it on my project so I'll work with it anyway.	1	0	https://issues.apache.org/jira/browse/AMQ-826

#	Requirement	Questions	Answered	Successfully Answered	URL
18436	AMQ-826	Hi, I've been busy with another module. Based on Sepand's contribution, I made LDAPCertificateLoginModule that takes certificate from SSL connection and verifies it against LDAP. I'll commit it together with unit test. Now, about testing with Apache directory: What (I understood) you asked for (and I volounteered) is the ability of unit tests to start (an embedded instance of) directory server loladed with testing data and perform unit tests against it. Right now, I start manually ApacheDS and perform unit tests but we want that automated, right? If that is the case, I believe I can make that easily (I already started ApacheDS as embedded). But, if I understood you correctly, you would like to utilize existing libraries from AMQ project and submit only the difference, is this correct? I'll try to find the differences, too, but my knowledgde of Maven is extremly poor so I won't be able to produce some kond of '.pom' or whatever appropriate. I'll just submit the jars and the code, would that be acceptable?	1	0	https://issues.apache.org/jira/browse/AMQ-826
18437	AMQ-826	I finished improvement together with unit test (running on external ADS). There are two assumptions I want to confirm: 1. Composite destinations ACL set of a composite destination is a union of ACL sets of each particular destination. I deduced this from code (DefaultAuthorizationMap) and implemented the same although it does not seem logical to me. Intersection of sets would be more appropriate, I believe. Should I implement the intersection or leave the union? 2. Wildcard destinations Wildcards are given in authorization policy source (xml map or ldap or...) to allow creation (primarily) of a destination in a certain namespace. Wildcard is ">" which means any destination. This meaning is unlimited in depth i.e. "ActiveMQ.Advisory.>" will suffice both for "ActiveMQ.Advisory.Connection" (> = Connection, same level) and for "ActiveMQ.Advisory.Queue.ABC123" (> = Queue.ABC123, one level more). Is this correct? Should I leave it as it is or restrict ">" to the same level only?	0	0	https://issues.apache.org/jira/browse/AMQ-826
18438	AMQ-826	Thanks for wildcard link. I did not implement '*', I'll finish it as well. Is it possible to have kind of regular expression like STOCKS.PRICE.NYSE.*BM ? Regarding composite destinations, I would like your attention: Union of ACLs means that if a user has privilege on at least one destination, all destinations will allow operation. Intersection of ACLs means that if a user lacks privilege on at least one destination, no destination will allow operation. I'll produce a test to verify this but my point is that current implementation of union is a security leak (if my understanding is correct). Suppose that a guest user wants to read from a destination not authorized for guests, say destination USERS.SECRET. A guest may create a destination in GUEST space with all necessary privileges, say GUEST.ALLOW. Now, the user creates a composite destination (GUEST.ALLOW, USERS.SECRET) and attempts an operation: Case UNION: as operation is permitted on GUEST.ALLOW it is sufficient for composite destination; operation is performed on both destinations in spite of the fact that user is not authorized for the other. Case INTERSECTION: as operation is NOT permitted on USERS.SECRET no operation is attempted on composite destination. Now, maybe I got it wrong but the method 'getXXXXXACLs()' in DefaultAuthorizationMap is pretty clear - it adds all ACLs from all entries...	0	0	https://issues.apache.org/jira/browse/AMQ-826
18439	AMQ-826	was able to run this as it is but I wasn't able to run it in activemq-core and activemq-jaas eclipse projects. I tried to add libraries but I always ended up with exception, both in core and jaas modules: Exception in thread "main" org.springframework.beans.factory.BeanCreationException: Error creating bean with name 'configuration' defined in file [C:\ActiveMQ\activemq\activemq-jaas\server.xml]: Instantiation of bean failed; nested exception is org.springframework.beans.BeanInstantiationException: Could not instantiate bean class [org.apache.directory.server.configuration.MutableServerStartupConfiguration]: Constructor threw exception; nested exception is java.lang.IncompatibleClassChangeError Caused by: org.springframework.beans.BeanInstantiationException: Could not instantiate bean class [org.apache.directory.server.configuration.MutableServerStartupConfiguration]: Constructor threw exception; nested exception is java.lang.IncompatibleClassChangeError Caused by: java.lang.IncompatibleClassChangeError at org.apache.directory.server.core.authn.AuthenticationService.<clinit>(AuthenticationService.java:66) at org.apache.directory.server.core.configuration.StartupConfiguration.setDefaultInterceptorConfigurations(StartupConfiguration.java:161) at org.apache.directory.server.core.configuration.StartupConfiguration.<init>(StartupConfiguration.java:88) at org.apache.directory.server.configuration.ServerStartupConfiguration.<init>(ServerStartupConfiguration.java:65) at org.apache.directory.server.configuration.MutableServerStartupConfiguration.<init>(MutableServerStartupConfiguration.java:43) at sun.reflect.NativeConstructorAccessorImpl.newInstance0(Native Method) at sun.reflect.NativeConstructorAccessorImpl.newInstance(Unknown Source) at sun.reflect.DelegatingConstructorAccessorImpl.newInstance(Unknown Source) at java.lang.reflect.Constructor.newInstance(Unknown Source) at org.springframework.beans.BeanUtils.instantiateClass(BeanUtils.java:82) at org.springframework.beans.BeanUtils.instantiateClass(BeanUtils.java:59) at org.springframework.beans.factory.support.SimpleInstantiationStrategy.instantiate(SimpleInstantiationStrategy.java:52) at org.springframework.beans.factory.support.AbstractAutowireCapableBeanFactory.instantiateBean(AbstractAutowireCapableBeanFactory.java:639) at org.springframework.beans.factory.support.AbstractAutowireCapableBeanFactory.createBeanInstance(AbstractAutowireCapableBeanFactory.java:625) at org.springframework.beans.factory.support.AbstractAutowireCapableBeanFactory.createBean(AbstractAutowireCapableBeanFactory.java:380) at org.springframework.beans.factory.support.AbstractBeanFactory$1.getObject(AbstractBeanFactory.java:245) at org.springframework.beans.factory.support.DefaultSingletonBeanRegistry.getSingleton(DefaultSingletonBeanRegistry.java:141) at org.springframework.beans.factory.support.AbstractBeanFactory.getBean(AbstractBeanFactory.java:242) at org.springframework.beans.factory.support.AbstractBeanFactory.getBean(AbstractBeanFactory.java:156) at org.springframework.beans.factory.support.DefaultListableBeanFactory.preInstantiateSingletons(DefaultListableBeanFactory.java:290) at org.springframework.context.support.AbstractApplicationContext.refresh(AbstractApplicationContext.java:348) at org.springframework.context.support.FileSystemXmlApplicationContext.<init>(FileSystemXmlApplicationContext.java:89) at org.springframework.context.support.FileSystemXmlApplicationContext.<init>(FileSystemXmlApplicationContext.java:74) at	0	0	https://issues.apache.org/jira/browse/AMQ-826
18440	AMQ-816	Hi, would this include also tackling the problem that having a persistent consumer on one broker he won't be forwarded the messages that were persisted in some other? I am thinking about the following case: we have a network of brokers, say brokerA and brokerB. A consumer subscribes with a unique id client1:subscription1 to brokerB. Therefore, if offline, messages will be persisted on brokerB. After a while, brokerB goes down, and the same consumer fails over to brokerA. He's able to receive all new messages, but will not receive persisted messages when brokerB comes back to life. What I would like to see is basically a consumer be recognized as unique over an entire network of brokers and not just on one broker, so messages persisted in one broker could also be forwarded whenever a durable subscription would appear somewhere else on the network. Thank you! daniel	1	0	https://issues.apache.org/jira/browse/AMQ-816
18441	AMQ-805	Hi Tom, do you have a test case?	1	0	https://issues.apache.org/jira/browse/AMQ-805

#	Requirement	Questions	Answered	Successfully Answered	URL
18442	AMQ-805	Does this make sense as a way to deal with the problem? Obviously before committing this we should make the interval configurable, and probably make it exponential. I am also still concerned about thread safety, but that is a separate issue.	0	0	https://issues.apache.org/jira/browse/AMQ-805
18443	AMQ-795	For this plugin we can just have a specific admin role (ie. tempAdmin) for the temporary destinations. Then we can grant by default everyone admin roles for temp destinations and still be able to remove them for certain users. Since temp destination names are generated at runtime we'll need an approach so we can map all temp destinations to a specific role. I was thinking of just adding a setter method inside the authorizationMap to set the authorizationentry for temporary destinations : ie. ..... <authorizationMap> <authorizationEntries> <authorizationEntry queue="QUEUE.USERS.>" "read="admins" write="admins" admin="admins"/> <authorizationEntry topic="TOPIC.USERS.>" read="admins" write="admins" admin="admins" /> </authorizationEntries> <tempAuthorizationEntry tempAdmin="tempAdmins" /> </authorizationMap>\	0	0	https://issues.apache.org/jira/browse/AMQ-795
18444	AMQ-794	I tried this in the broker config and by defaulting advisorySupport to false in BrokerService. I hard coded isAdvisorySupport( ) to return false... Should these still be created?: 2006-07-19 17:22:09,179 [localhost:61616] INFO TransportConnection - Created new TransportConnection. Broker:a01 2006-07-19 17:22:09,201 [127.0.0.1:39964] INFO ActiveMQDestination - Creating destination: topic://ActiveMQ.Advisory.TempQueue 2006-07-19 17:22:09,201 [127.0.0.1:39964] INFO ActiveMQDestination - Creating destination: topic://ActiveMQ.Advisory.TempTopic 2006-07-19 17:22:09,201 [127.0.0.1:39964] INFO RegionBroker - Adding consumer for destination: topic://ActiveMQ.Advisory.TempQueue,topic://ActiveMQ.Advisory.TempTopic 2006-07-19 17:22:09,201 [127.0.0.1:39964] INFO AbstractRegion - Adding consumer: ID:photon.duncllc.com-39963-1153347728978-1:0:-1:1 2006-07-19 17:22:09,204 [127.0.0.1:39964] INFO AbstractRegion - Adding subscription to destination:Topic: destination=topic://ActiveMQ.Advisory.TempQueue,topic://ActiveMQ.Advisory.TempTopic, subscriptions=0	0	0	https://issues.apache.org/jira/browse/AMQ-794
18445	AMQ-788	Fixing in trunk revision 418486 Should we also do this for the 4.0.2 release?	0	0	https://issues.apache.org/jira/browse/AMQ-788
18446	AMQ-730	Which are the parts of the javadoc which you think most need improvement? http://incubator.apache.org/activemq/maven/activemq-core/apidocs/	0	0	https://issues.apache.org/jira/browse/AMQ-730
18447	AMQ-729	Can you reproduce this on 4.0.1?	0	0	https://issues.apache.org/jira/browse/AMQ-729
18448	AMQ-729	FWIW, I tried to execute the test case but on Windows machine (which obviously changes everything) and with 4.0.1. It all worked. Has anyone else been able to reproduce this behaviour with 4.0.1?	0	0	https://issues.apache.org/jira/browse/AMQ-729
18449	AMQ-702	Adrian, Do you known when you will get around to fixing this?	1	0	https://issues.apache.org/jira/browse/AMQ-702
18450	AMQ-688	How can we collaborate on this work? The described functionality is crucial to ActiveMQ's success within our organization.	1	0	https://issues.apache.org/jira/browse/AMQ-688
18451	AMQ-660	The statement that is being executed is: DELETE FROM ACTIVEMQ_MSGS WHERE (EXPIRATION<>0 AND EXPIRATION<?) OR ID <= (SELECT min(ACTIVEMQ_ACKS.LAST_ACKED_ID) FROM ACTIVEMQ_ACKS WHERE ACTIVEMQ_ACKS.CONTAINER=ACTIVEMQ_MSGS.CONTAINER) Johan, does MaxDB support subselects?	1	1	https://issues.apache.org/jira/browse/AMQ-660
18452	AMQ-660	OK, I got an answer back from one of the MaxDB devs. Apparently, the issue is a known bug, that is fixed in the latest 7.5 version of it (and assume in the 7.6 branch, too). Thus, long term there is no issue here. However, since I'm running it all on Debian Sarge, I'm relying on the Debian team to potentially backport the fix into their stable package version, or run their testing package of MaxDB instead. Until I can look into that, is the ACTIVEMQ_MSGS_EIDX index critical to the functioning of activemq, or can I drop it for now and still expect reasonable performance?	1	1	https://issues.apache.org/jira/browse/AMQ-660
18453	AMQ-660	OK, I've manually dropped the offending index, and it seems not to be recreated by adding the <createSchemaStatements/> element to the config as explained above (were I to deploy activemq on a new machine using the same MaxDB version, I assume that I'd need first to start the broker without a createSchemaStatements tag to have it create the full schema, and then manually drop the insex, insert the element in activemq.xml and restart, correct?). However, adding the deleteOldMessages attribute to the statements element gives this error when starting the broker: ERROR: java.lang.RuntimeException: Failed to execute start task. Reason: org.springframework.beans.factory.BeanDefinitionStoreException: Line 26 in XML document from class path resource [activemq.xml] is invalid; nested exception is org.xml.sax.SAXParseException: The value of attribute "deleteOldMessagesStatement" associated with an element type "statements" must not contain the '<' character. ERROR: java.lang.Exception: org.springframework.beans.factory.BeanDefinitionStoreException: Line 26 in XML document from class path resource [activemq.xml] is invalid; nested exception is org.xml.sax.SAXParseException: The value of attribute "deleteOldMessagesStatement" associated with an element type "statements" must not contain the '<' character. Removing the less than character fixes the issue, but obviously makes the statement wrong. Is there some way to rewrite the less than character in activemq.xml? Finally, so far I'm still using the statements attributes that were needed to get MaxDB to operate with MaxDB in the first place (binaryDataType ="LONG BYTE" longDataType ="INTEGER" stringIdDataType="VARCHAR(250) ASCII"). Can I remove them, now that the snapshots starting on 3/29 contain automatic support for MaxDB, or are they still needed?	1	1	https://issues.apache.org/jira/browse/AMQ-660
18454	AMQ-660	A further piece of input: I changed the deleteOldMessagesStatement to be "DELETE FROM ACTIVEMQ_MSGS WHERE ID = (SELECT min(ACTIVEMQ_ACKS.LAST_ACKED_ID) FROM ACTIVEMQ_ACKS WHERE ACTIVEMQ_ACKS.CONTAINER=ACTIVEMQ_MSGS.CONTAINER) (I know that just dropping the < character probably makes the statement not very useful, but wanted to move past the error I reported above), and let the broker run for a while (with the ACTIVEMQ_MSGS_EIDX index dropped). I then get this message regularly: WARN JDBCPersistenceAdapter - Old message cleanup failed due to: com.sap.dbtech.jdbc.exceptions.JDBCDriverException: SAP DBTech JDBC: Column index 1 was not found. Did my change of the delete statement cause the dropped index to be needed, or do I need to make other changes to the statements used?	1	1	https://issues.apache.org/jira/browse/AMQ-660
18455	AMQ-660	Hiram, Using the deleteOldMessagesStatement you specify above does make the "Column index 1 was not found" go away, and the example producer and consumer still work. I just have one remaining question: The offending ACTIVEMQ_MSGS_IDX index still seems to be automatically created on startup, even though I have the empty createSchemaStatements element in activemq.xml like this: <persistenceAdapter> <journaledJDBC journalLogFiles="5" dataDirectory="../activemq-data" dataSource="#maxdb-ds"> <statements> <statements deleteOldMessagesStatement="DELETE FROM ACTIVEMQ_MSGS WHERE <>? AND ID <= (SELECT min(ACTIVEMQ_ACKS.LAST_ACKED_ID) FROM ACTIACTIVEMQ_ACKS WHERE ACTIVEMQ_ACKS.CONTAINER=ACTIVEMQ_MSGS.CONTAINER)"/> <createSchemaStatements /> </statements> </journaledJDBC> </persistenceAdapter> Do I need to nest the statements elements in some other way to get the createSchemaStatements to have the desired effect?	1	1	https://issues.apache.org/jira/browse/AMQ-660

#	Requirement	Questions	Answered	Successfully Answered	URL
18456	AMQ-657	Hi Kevin, could you re test this issue against 4.0 final? The failover transport should bre reaisnt those interupted and resumed events now.	1	1	https://issues.apache.org/jira/browse/AMQ-657
18457	AMQ-657	Hiram, I will test this out. Just applied the 4.0 (incubator) release to my test system the other day. Btw: when will 4.0 get out of incubator?	1	1	https://issues.apache.org/jira/browse/AMQ-657
18458	AMQ-656	Mats, thank you for that update and the patch. I have run the unittests with Broker 4.0 on Windows XP. The unittest are ok, but however there is an "unknown command" when closing the connection after receiving the Shutdown-message. Here is the last part of the output when running with uri: "tcp://localhost:61616/trace=true" . . . Send/receive a text message to a queue synchronously Sending command: cmd.id = 35, corr.id = -1, type = SESSION_INFO Received command: cmd.id = 32, corr.id = 35, type = RESPONSE Sending command: cmd.id = 36, corr.id = -1, type = CONSUMER_INFO Received command: cmd.id = 33, corr.id = 36, type = RESPONSE Sending command: cmd.id = 37, corr.id = -1, type = PRODUCER_INFO Received command: cmd.id = 34, corr.id = 37, type = RESPONSE Sending command: cmd.id = 38, corr.id = -1, type = ACTIVEMQ_TEXT_MESSAGE Received command: cmd.id = 35, corr.id = -1, type = ACTIVEMQ_MSG_DISPATCH Received command: cmd.id = 36, corr.id = 38, type = RESPONSE Sending command: cmd.id = 39, corr.id = -1, type = ACTIVEMQ_MSG_ACK Sending command: cmd.id = 40, corr.id = -1, type = REMOVE_INFO Received command: cmd.id = 37, corr.id = 40, type = RESPONSE Sending command: cmd.id = 41, corr.id = -1, type = REMOVE_INFO Received command: cmd.id = 38, corr.id = 41, type = RESPONSE Sending command: cmd.id = 42, corr.id = -1, type = REMOVE_INFO Received command: cmd.id = 39, corr.id = 42, type = RESPONSE [OK] Sending command: cmd.id = 43, corr.id = -1, type = REMOVE_INFO Received command: cmd.id = 40, corr.id = 43, type = RESPONSE Sending command: cmd.id = 44, corr.id = -1, type = SHUTDOWN Received command: cmd.id = 41, corr.id = -1, type = SHUTDOWN ERROR: Unknown command: ♂ Received exception = 'Unmarshal failed; unknown data structure type 204, at c:\programme\incubator-activemq-4.0\openwire-cpp-bugfix\src\main\cpp\activemq\protocol\openwire\openwireprotocol.cpp line 144' ERROR: Received a broker exception: Unmarshal failed; unknown data structure type 204, at c:\programme\incubator-activemq-4.0\openwire-cpp-bugfix\src\main\cpp\activemq\protocol\openwire\openwireprotocol.cpp line 144 Exiting read loop due to exception: Unmarshal failed; unknown data structure type 204, at c:\programme\incubator-activemq-4.0\openwire-cpp-bugfix\src\main\cpp\activemq\protocol\openwire\openwireprotocol.cpp line 144 --------- Where does this additional stuff come from? Thanks for your help Heinrich	1	0	https://issues.apache.org/jira/browse/AMQ-656
18459	AMQ-648	Hi, You could configure the management context in the broker config using the following code snippet: <broker useJmx="true"> <managementContext> <managementContext connectorPort="2011" connectorPath="/mypath"/> </managementContext> .... </broker> You could do the same thing for POJOs as well, AFAIK. BTW, as a minor note, the console doesn't support it yet if you change the domain name. :) Is this what you are looking for? Regards, Adrian Co	1	0	https://issues.apache.org/jira/browse/AMQ-648
18460	AMQ-637	Sounds fine with me :) BTW is the idea that the socket will only be open for the duration of the input stream, so that the transfer is independent of the underlying JMS connection? We do need to chunk the message on the broker side to avoid it having to load the whole stream into RAM; is this OK with you?	0	0	https://issues.apache.org/jira/browse/AMQ-637
18461	AMQ-629	Adiran, Is this still broken?	0	0	https://issues.apache.org/jira/browse/AMQ-629
18462	AMQ-608	Hiram, Thanks. I will use svn diff in the future. So, what is the time frame of 4.0.1? Like I commented in the other issue, when will 4.0 get out of incubator?	1	1	https://issues.apache.org/jira/browse/AMQ-608
18463	AMQ-596	what's the change in configuration to use this feature? I didnt see it in the docs...	1	0	https://issues.apache.org/jira/browse/AMQ-596
18464	AMQ-591	How does this relate to bug AMQ-775? http://issues.apache.org/activemq/browse/AMQ-775	0	0	https://issues.apache.org/jira/browse/AMQ-591
18465	AMQ-517	Nathan, can we resolve this issue now?	1	0	https://issues.apache.org/jira/browse/AMQ-517
18466	AMQ-498	I'm unable to crash the transport by doing this with 5.1.0, Hiram. Is this still a problem in 5.1 or have the commands been changed to handle this correctly?	0	0	https://issues.apache.org/jira/browse/AMQ-498
18467	AMQ-498	Fyi, this change broke us. In the future you should try to make changes that are backwards compatible. If they are not, they should be explicitly mentioned in the release notes. In this case, how many people really need it? It could have been that if the maxFrameSize is not explicitly set, then frame size checking would be disabled - as before. I will say, it is a great feature for those who have publicly exposed brokers. Thanks!	1	0	https://issues.apache.org/jira/browse/AMQ-498
18468	AMQ-486	Hi James, added only basic implementation for Referenceable. I'm not sure if what is needed is the whole jndi stuff. (i.e. creating the JNDIStorableInterface interface, JNDIBaseStorable abstract class, ObjectFactory, etc.). Let me know if you require the whole thing. :) Thanks! Is the object factory needed? I'm not that familiar yet with jndi, so I wasn't sure. :)	1	1	https://issues.apache.org/jira/browse/AMQ-486
18469	AMQ-486	Ported jndi implementation of references from 3.x to 4.x (just copied it actually). I noticed that the initial context does not use references, but stores the whole object, should this be change to just use the object reference?	0	0	https://issues.apache.org/jira/browse/AMQ-486
18470	AMQ-388	Richard, as a start could you let us know what the JDBC driver name is? e.g. {code} connection = ... connection.getMetaData().getDriverName() {code} Also what is the closest JDBC language to it? i.e. whats the most efficient way of dealing with BLOBs via JDBC - using getBytes()? Or streams/blobs?	0	0	https://issues.apache.org/jira/browse/AMQ-388
18471	AMQ-378	Is this still relevant? Does the slow consumer functionality not cover this?	1	0	https://issues.apache.org/jira/browse/AMQ-378
18472	AMQ-370	Is the sleep time formula correct anyway ? It would be nice to support different backoff strategies. I'd prefer to have the redelivery time computed like this: sleepTime = initialRedeliveryTimeout * pow(backoffIncreaseRate, deliverCount) truncated to some maximum value.	1	0	https://issues.apache.org/jira/browse/AMQ-370
18473	AMQ-360	Is there any documentation on how the total ordering of topics across the network will be achieved? Can you point us to any white papers on the issue. We would like to know if this feature will be in ActiveMQ 5.3.0 and when the release date for 5.3.0 be. Thanks Jim....	0	0	https://issues.apache.org/jira/browse/AMQ-360
18474	AMQ-340	This sounds like WSN root then maps to a broker instance. Since a JVM can run more than 1 broker, the WSN layer just needs to route requests to different brokers based on the root. What do you think?	0	0	https://issues.apache.org/jira/browse/AMQ-340
18475	AMQ-321	Do we know if this is still the case in 4.0?	1	0	https://issues.apache.org/jira/browse/AMQ-321
18476	AMQ-318	How to configure the checkpointInterval of the JournalPersistenceAdapter in 5.3.1 release? We are planning to use high performance Journal + Mysql permanent persistent . So our config is: <persistenceAdapter> <journaledJDBC dataDirectory="${activemq.base}/broker" dataSource="#mysql-ds" /> </persistenceAdapter> But we are also planning to control the checkpointInterval, so puzzling how to configure it. Thanks lot.	1	0	https://issues.apache.org/jira/browse/AMQ-318

#	Requirement	Questions	Answered	Successfully Answered	URL
18477	AMQ-318	Looks like this is not possible in latest releases. Could you please let me know how to configure the Journal's checkpointinterval in the latest releases? Is it possible? Or any workaround? We are using 5.4.0 and the config we are using is: <persistenceFactory> <journalPersistenceAdapterFactory journalLogFiles="5" dataDirectory="${basedir}/activemq-data" dataSource="#mysql-ds /> </persistenceFactory> Any help would be really appreciated. Thank you. Krishna	1	0	https://issues.apache.org/jira/browse/AMQ-318
18478	AMQ-305	SET AUTOCOMMIT TO OFF is no longer supported in Postgre8.1 When i start the broker with JDBCPersistence the following error occurs Nov 17, 2007 2:21:27 PM org.apache.activemq.store.jdbc.JDBCPersistenceAdapter createAdapter INFO: Database driver recognized: [postgresql_native_driver] Exception in thread "main" java.io.IOException: ERROR: SET AUTOCOMMIT TO OFF is no longer supported at org.apache.activemq.util.IOExceptionSupport.create(IOExceptionSupport.java:43) at org.apache.activemq.store.jdbc.TransactionContext.getConnection(TransactionContext.java:62) at org.apache.activemq.store.jdbc.TransactionContext.begin(TransactionContext.java:147) at org.apache.activemq.store.jdbc.JDBCPersistenceAdapter.start(JDBCPersistenceAdapter.java:156) at com.glenwood.Queue.StartBroker.createPersistenceAdapter(StartBroker.java:49) at com.glenwood.Queue.StartBroker.main(StartBroker.java:28) Caused by: java.sql.SQLException: ERROR: SET AUTOCOMMIT TO OFF is no longer supported at org.postgresql.core.QueryExecutor.execute(QueryExecutor.java:131) at org.postgresql.jdbc1.AbstractJdbc1Connection.ExecSQL(AbstractJdbc1Connection.java:482) at org.postgresql.jdbc1.AbstractJdbc1Connection.ExecSQL(AbstractJdbc1Connection.java:461) at org.postgresql.jdbc1.AbstractJdbc1Connection.setAutoCommit(AbstractJdbc1Connection.java:953) at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method) at sun.reflect.NativeMethodAccessorImpl.invoke(Unknown Source) at sun.reflect.DelegatingMethodAccessorImpl.invoke(Unknown Source) at java.lang.reflect.Method.invoke(Unknown Source) at org.postgresql.ds.common.PooledConnectionImpl$ConnectionHandler.invoke(PooledConnectionImpl.java:360) at $Proxy0.setAutoCommit(Unknown Source) at org.apache.activemq.store.jdbc.TransactionContext.getConnection(TransactionContext.java:58) ... 4 more I am using postgresql-8.1-409.jdbc3.jar with Postgresql 8.1 ActiveMq.xml follows <persistenceAdapter> <journaledJDBC journalLogFiles="5" dataDirectory="../persistencedata" dataSource="#postgres-ds"/> </persistenceAdapter> <bean id="postgres-ds" class="org.postgresql.ds.PGPoolingDataSource"> <property name="serverName" value="1.1.1.180"/> <property name="databaseName" value="merge_emr_billing"/> <property name="portNumber" value="5432"/> <property name="user" value="pcare"/> <property name="password" value="pcare007"/> <property name="dataSourceName" value="postgres"/> <property name="initialConnections" value="1"/> <property name="maxConnections" value="10"/> </bean>	0	0	https://issues.apache.org/jira/browse/AMQ-305
18479	AMQ-269	Hi Ramzi We're hopefully gonna code freeze 3.1 on friday (22nd July) to get ready for 2 weeks of system testing prior to the 3.1 release. If you get this issue resolved by then, great it can go out in the 3.1 release - if not, I'll edit this issue to say that the fix version is 3.2. Good luck :)	1	1	https://issues.apache.org/jira/browse/AMQ-269
18480	AMQ-244	matthew.clark@despatch.net reported on the list: Hi there, just thought I would point out that the parseBoolean method has been used in the Producer/Consumer example. Obviously this method was only introduced in Java 1.5 so breaks the examples for 1.4.x users. Does this indicate a shift to Java 1.5 or was this a slip of the hand?	0	0	https://issues.apache.org/jira/browse/AMQ-244
18481	AMQ-197	Dominic, Fritz, Could you attach you server's log file to this incident. Would make fixing this problem easier.	1	1	https://issues.apache.org/jira/browse/AMQ-197
18482	AMQ-197	Is this still an issue? There's been a fair amount of work tidying up support for SQL Server - could you double check this is still an issue in 3.0-SNAPSHOT?	0	0	https://issues.apache.org/jira/browse/AMQ-197
18483	AMQ-196	I've removed the sleep() calls and used a semaphore now instead. I'm hoping this resolves any issues with Hermes as well - could someone verify please? By all means reopen this issue if you still have an issue.	0	0	https://issues.apache.org/jira/browse/AMQ-196
18484	AMQ-186	Yes, I will create a patch to add this functionality. I think I found another problem though. While the soTimeout property is exposed. The "read loop" (run() method) is mishandling it. I found the following code: if (changeTimeout) { socket.setSoTimeout(soTimeout); } if (changeTimeout) { socket.setSoTimeout(0); } This will set the read timeout, then immediately turn if off again before actually performing the read. Without the CVS history I am not able to determine when this problem was introduced. Does anyone have any knowledge of when the soTimeout property support and if the second call to socket.setSoTimeout() was just a coding mistake or intentional?	1	0	https://issues.apache.org/jira/browse/AMQ-186
18485	AMQ-183	Some notes.. For a Derby database, when a create table is issued when the table already exists, SQLException.getSQLState() will return "X0Y32" (see LANG_OBJECT_ALREADY_EXISTS_IN_OBJECT in Derby's SQLState class). If we were to use the getTables(catalog,schemaPattern,tableNamePattern,types[]) method in the java.sql.DatabaseMetaData class, couldn't it return more than one table if the table was create under two different schemas (e.g. created by two different users)? Do we have enough information available to pass to getTables(..) to reliably detect if the table has already been created?	0	0	https://issues.apache.org/jira/browse/AMQ-183
18486	AMQ-183	Well, that's a common problem. Suppose the table does exist in another schema, how does AMQ know if the DBA meant for it to use that one or to create another in this schema? The "attempt create" model currently used assumes one configuration. Another issue with using metadata is the presence of synonyms - there may not be a table with that name, but there may be a synonym that refers to a different one. The main reason I opened this issue is that there is no real benefit to the user in having the stack trace dumped and it just adds confusion; I think just logging a message would be an improvement. More advanced check on metadata would be useful but I agree that handling all the different scenarios possible in dbms land are hard (we dealt with many of the same things wanting to create tables for CMP EJBs).	0	0	https://issues.apache.org/jira/browse/AMQ-183

#	Requirement	Questions	Answered	Successfully Answered	URL
18487	AMQ-122	The new supportJMSPriority configuration attribute is not supported in 4.0-M4. When I try start my broker with that attribute set I get the following error: ERROR: java.lang.RuntimeException: Failed to execute start task. Is this problem happening only on 4.0.1 version of activeMQ ? is it fixed in 4.2 ? Please help and clarify how i can enable priority for messages, producers and consumers. - Sreenivas Sama	0	0	https://issues.apache.org/jira/browse/AMQ-122
18489	AMQ-122	Hi, I'm having the same issue. In my case, I cannot simply use a message selector because I need to have a fixed amount of consumers. I have a maximum of six consumers allowed, and they are used to process both low and high-priority messages. I would like to be able to use my six listeners to the maximum of their capacity instead of dedicating a certain number to low-priority messages and the rest to high-priority messages... Could someone please point me to a patch or fix this issue ? Thanks ! Philippe	1	0	https://issues.apache.org/jira/browse/AMQ-122
18490	AMQ-122	Is this issue really fixed - as in having added code that solves the problem? Or is it rather resolved as in "Wont-fix" - because there is a suggested workaround in the resequencer pattern?	0	0	https://issues.apache.org/jira/browse/AMQ-122
18491	AMQ-116	How about, if we added an AdminMBean so that you could shut down the broker by calling the 'stop' method in a JMX console? We should have a JMX-JMS bridge soon as well; so management commands could be called by sending a message as well. So then we'd have both options - using a JMX console and by sending a message to a management queue/topc/	1	1	https://issues.apache.org/jira/browse/AMQ-116
18492	AMQ-107	Vey nice! It would be cool if resolved issues contained a link the associated documentation when appopriate. Like in this case, how is max attempts set? Can it be set per queue? Can it be changed at runtime? Can a unique deadletter queue be specified per delivery queue?	0	0	https://issues.apache.org/jira/browse/AMQ-107
18493	AMQ-103	Per spec, ObjectMessages are allways serialized on send so I think to original intent of this issue is actually a non-issue. What was an issue is if two ear/wars were deployed each with his own private copy of activemq and the user wants to have the apps talk to each other without going over tcp/ip. Simple scenario is that webapp 1 is deployed with an embeded broker and webapp 2 wants to connect to it using a vm transport. Since the ActiveMQ classes are not == due to being loaded in different classloaders the current vm transport will throw class cast exceptions it tries to talk to the broker. Solution: use the activeio:vmpipe://localhost transport. The activeio vmpipe moves mesage in low level packets that are easy to bridge from one classloader to another. Yes, ActiveMQ packets do need to serialize down the byte[]s but the network stack overhead is eliminated and you also get a direct invocation on the broker like the current vm transport works.	0	0	https://issues.apache.org/jira/browse/AMQ-103
18494	AMQ-88	Could you give us some more details to go on - e.g. how are you running these commands? Is the broker still running when the consumer tool starts up? What command line arguments are you using? Both the producer and consumer tools are working fine for us over here. e.g. using the example instructions... http://activemq.codehaus.org/Examples or just running things directly in an IDE. Maybe a full dump of the command shell in which you're running the ConsumerTool would help?	1	1	https://issues.apache.org/jira/browse/AMQ-88
18495	AMQ-88	The log you attached looks like the broker's output, not the output of the ConsumerTool. From the broker's perspective, this looks like the consumer tool is terminating and the socket is closing (this could just be a spurious log message which we fixed in 1.1). Does the ConsumerTool receive a message and terminate? Maybe things are working correctly and this is just a spurious exception message that we should be eating (which we are now doing in 1.1 I think)? If not - could you attach the output of the ConsumerTool. If you've already attached the full output, then something strange is going on, since the consumer doesn't throw any exceptions that it can't connect, or has lost connection, yet the broker does which is strange.	1	1	https://issues.apache.org/jira/browse/AMQ-88
18496	AMQ-88	Ya James, you are right that the log which i sent is for the Broker and the ConsumerTool and even this is true that ConsumerTool is getting terminated normally without throwing any exception. But now the question is y does not it pickup the messages when the same are present in the queue and the MessageBroker is running, because i do not find anything wrong with the ConsumerTool's code. Secondly James, what did i observe when i ran ProducerTool(MessageBroker is running) and put some messages, the size of the file "Store.db" under "ActiveMQ" directory does not increase. But when i stop the Broker, that file gets updated and its size increases!! It seems there are many things which are going wrong :)	1	1	https://issues.apache.org/jira/browse/AMQ-88
18497	AMQ-65	Wanna take a stab at this?	0	0	https://issues.apache.org/jira/browse/AMQ-65
18498	AMQ-62	Where is Java serialization currently used? Is it when sending a JMS message that you chose to send serialized objects?	0	0	https://issues.apache.org/jira/browse/AMQ-62

#	Requirement	Questions	Answered	Successfully Answered	URL
18499	AMQ-50	What problem are you having? I've been using the maven rar plugin for a couple of months on activemq with no problems. The source code stays in src/java just like any other module, only the ra.xml etc goes in src/rar/META-INF	1	1	https://issues.apache.org/jira/browse/AMQ-50
18500	AMQ-49	Are we ready now? :)	1	1	https://issues.apache.org/jira/browse/AMQ-49
18501	AMQ-47	Good point. How much should we even try to cope with? Client version < server verion. Server version < client version. And Dito for server to server communications. Should we try to resolve this in 2.0? I think at a minimum we need to allow future servers to cope with old versions of the messages in it's persistence stores.	0	0	https://issues.apache.org/jira/browse/AMQ-47
18502	AMQ-45	What good is a CCI implementation compared to using jms interfaces? Are you intending to suggest that a jca 1.0 outbound-only adapter implementation would be useful?	0	0	https://issues.apache.org/jira/browse/AMQ-45
18503	AMQ-22	Are you refering to providing some visualization tools into the types of messages that are flowing through the broker?	0	0	https://issues.apache.org/jira/browse/AMQ-22
18504	AMQ-21	Could you explain what you mean by this a little more?	0	0	https://issues.apache.org/jira/browse/AMQ-21
18505	AMQ-15	This seems to be more dup checking than reliability. Or is this meant to encompass implementing one of the HTTPR specs?	1	0	https://issues.apache.org/jira/browse/AMQ-15
18506	AMQ-11	Is this sorted now? Can we mark it as fixed?	0	0	https://issues.apache.org/jira/browse/AMQ-11
18507	AMQNET-422	I can compile that code to .NET 2.0 at least in VS 2012 and 2013. Are you using an old compiler? And the only change to None DTC that some code was extracted from Dispatch into a new method DispatchToAsyncListener. Is this really a too big change?	1	0	https://issues.apache.org/jira/browse/AMQNET-422
18508	AMQNET-403	do you have a build?	1	0	https://issues.apache.org/jira/browse/AMQNET-403
18509	AMQNET-403	Hi, we tested it, looks good. url parameter flag is: transport.priorityBackup=true Do you have a paypal account (personal/team) which you can use to accept payment?	0	0	https://issues.apache.org/jira/browse/AMQNET-403
18510	AMQNET-327	Hi, Eddie. Thanks for the feedback. I fully understand that some are unable to upgrade to VS2010. However, would it be too much trouble for you to use the NAnt scripts for building? You will still be able to perform any necessary debugging in your own project from the resulting build output. The only thing you won't be able to do is build from within the IDE, unless you install the free VS2010 Express. I guess I'm looking to find out what you won't be able to do and how much of an inconvenience it will be. There is a certain amount of inconvenience in maintaining multiple IDE build projects, which are themselves redundant to the NAnt scripts.	1	1	https://issues.apache.org/jira/browse/AMQNET-327
18511	AMQNET-290	Very good, I'm really interested in testing this: What's the simplest way ? Via Fuse support ?	1	1	https://issues.apache.org/jira/browse/AMQNET-290
18512	AMQNET-290	Hi, Does the current implementation support both local and distributed transactions ? Another point, if I understand correctly, in distributed mode NMS will be enlisted as durable. But in local mode, NMS will be enlisted as volatile. Am I correct ? If yes, what are the consequences ? Is the message lost ? Regards	1	1	https://issues.apache.org/jira/browse/AMQNET-290
18513	AMQNET-290	Thanks for answer. I understand that enlisting as a durable resource manager is difficult. My only concern is about the side effects. I don't understand what's happening when the code using NMS crashes in the middle of a transaction ? Do we lose the message ? Is the transaction aborted ? Thanks again for the snapshot, I should be able to test it next week.	1	1	https://issues.apache.org/jira/browse/AMQNET-290
18514	AMQNET-271	Instead of a callback interface style of programming, wouldn't it be more .NET-like to use an event driven architecture? For example: The IMessageProducer interface would support a PreSendMessageEvent that could be used to register an event handler for processing the message. Likewise, the IMessageConsumer interface would support a PreDispatchMessageEvent event. This would make implementations cleaner and simpler, by creating a separation of concerns. The implementor would not be forced to implement both transforms, since they could create event handlers individually in case they only want to handle pre-dispatch events and don't care about pre-send events. Just trying to understand this feature a bit more.	1	1	https://issues.apache.org/jira/browse/AMQNET-271
18515	AMQNET-271	Events allow for multiple subscribers which you definitely don't want in this case. Plus I always find the event / delegate model in .NET to be a bit annoying as I have to read a book every time I want to use them. The purpose of this feature is to allow client to configure a producer or consumer to transform a message into something they understand, for instance a client could use to send say an IStreamMessage which they know a Stomp client is listening on an have the MessageProducer apply the transform on the fly to convert it to a TextMessage encoded in a way the Stomp client can process. Or it could be used just as a means of content enrichment. I don't think that you'd want to multicast that given that each receiver could return their own converted message. Which one would you end up sending? We could of course provide a default implementation that overrides both and return null (null right now in my code just means use the original), then the user can use that to allow them to only implement the transform method they wanted. Plus this could add some extra code like helpers to copy standard NMS headers etc from the old to the new message. I had also intended to use this interface to create a generic NMS message Transformer that the client could use to transform NMS messages commands from one client to the command type that's needed in another. For example, the NMS.ActiveMQ client could accept ITextMessage from a MSMQ client and internally transform it into the NMS.ActiveMQ ITextMessage implementation. If there's some slick .NETy way of doing all this then feel free to comment, just make sure it works on the .NETCF 2.0 framework so it can run in NMS.Stomp :) Just wanted to get the ball rolling on something so nothing set in stone right now, comment away....	1	1	https://issues.apache.org/jira/browse/AMQNET-271
18516	AMQNET-271	Yeah, those look good. Although, I would change the naming somewhat to ProducerTransformerDelegate and ConsumerTransformerDelegate. The reason for this is you can have a cleaner name for the instance variable. For example: {code:title=snippet.cs} interface IMessageConsumer { ... ConsumerTransformerDelegate ConsumerTransformer; ... } interface IMessageProducer { ... ProducerTransformerDelegate ProducerTransformer; ... } {code} While I see how the JMS spec is attempting to support a resilient protocol, this change seems to be a departure from the current programming model. Isn't this something that should be handled internally to the provider implementation itself? This seems to be exposing a bit of the lower-level message handling up to the application layer. At what point should the application layer need to deal with message formats? Wouldn't the application layer just create a message in whatever logical format it needs and then send it?	1	1	https://issues.apache.org/jira/browse/AMQNET-271
18517	AMQNET-263	I think you must be. I just successfully ran all of the unit tests on Mono 2.6.4 on Windows 7. It seems like there was the normal number of pass/fail results, but I would have to double check to be sure. However, the tests all did run. My final result numbers were: "Passed: 416, Failed: 26, Errors: 3, Time: 568.95" I do notice that there are some visual drawing anomolies of the NUnit interface when running under Mono, and if I click on the Text Output tab, an error dialog pops up. How are you running the tests, and what version of Mono are you using? I am also running the .NET 3.5 build of the tests. Update: I ran the tests again on .NET CLR, and the results are slightly different: "Passed: 418, Failed: 24, Errors: 3" There are two tests that fail on Mono, but pass on .NET. I'm not sure which they are or if that might be expected or not.	1	0	https://issues.apache.org/jira/browse/AMQNET-263

#	Requirement	Questions	Answered	Successfully Answered	URL
18518	AMQNET-262	After researching and thinking on this topic, I am beginning to question the use of the GAC with NMS. One of the primary strengths of the architecture of NMS with broker specific provider implementations is that you can do simple file copies to install the assemblies. This allows for side-by-side installation of different versions of NMS. What is the requirement to install NMS and the provider assemblies into the GAC? I can't see how this has any benefit, but I can see how it has several downsides. Perhaps explaining how installing NMS+Providers into the GAC is a "good thing" would be helpful. I'm beginning to think we are trying to find a solution to a problem that doesn't exist.	1	1	https://issues.apache.org/jira/browse/AMQNET-262
18519	AMQNET-245	Just double checked and the broker will set the "timestamp" field so adding that should be fine. You'd need to add in the read of the TimeStamp header in the StompWireFormat as well I'd think. Can you work up a complete patch with the changes needed and include a Unit Test to validate that the functionality is working as expected. That would help us out a lot since I won't have time to get to that this week.	1	1	https://issues.apache.org/jira/browse/AMQNET-245
18520	AMQNET-239	Hi, Timothy, At http://msdn.microsoft.com/en-us/library/bb738067.aspx?ppud=4#SSLwiththe.NETCompactFramework microsoft states: {quote}The .NET Compact Framework has built-in support for SSL.{quote} How does that fit together? Thanks, Markus	1	1	https://issues.apache.org/jira/browse/AMQNET-239
18521	AMQNET-239	Sorry, i was pretty unclear. As Markus assumed i was talking about the Implementation of SSL-support for the Compact Framework. Unfortunately I'm not able to share the patch I've used to accomplish this goal. Don't get me wrong, I'm not selfish and I don't want to slave-drive the Apache.NMS project - it's just licensing issues. In spite of all that i want to outline what we have done. - Build bouncycastle (use the latest source code version from CVS - the released version 1.6.1 doesn't build for target netcf-2.0) - Derive a SslStream class from the compact framework stream Stream class - SslStream is acting as a 'proxy' to the encrypted in-/out-streams provided by the bouncycastle library (be aware of the async calls!). Implement SslStream similar to the CLI Implementation of Stream (http://www.123aspx.com/rotor/RotorSrc.aspx?rot=42052). - Add the initialization of the SSL-Stream to the SslTransport class. Create a NetworkStream around your socket. Use the bouncycastle TlsProtocolHandler to encrypt the network stream. Use your implementation of SslStream to wrap the Input-/OutputStream of the TlsProtocolHandler. No offense.	1	0	https://issues.apache.org/jira/browse/AMQNET-239
18522	AMQNET-237	Can you add some more info to this, your broker config and a sample app showing how your use case would be good.	1	1	https://issues.apache.org/jira/browse/AMQNET-237
18523	AMQNET-236	Should this item be Resolved with the change made to throw the exception?	1	0	https://issues.apache.org/jira/browse/AMQNET-236
18524	AMQNET-226	If I'm understanding this correctly then it looks ok to me. The Destination allows you the option of overriding the Prefetch policy settings on the Connection which should be considered the defaults for all Consumers. If you want a specific destination to have some other prefetch value than you set the "?consumer.prefetchSize=5" option on the destination and it overrides the defaults. What was the behaviour you were expecting?	1	1	https://issues.apache.org/jira/browse/AMQNET-226
18525	AMQNET-224	Why don't you just create your own implementation of IRedeliveryPolicy and set that on the Connection object?	1	1	https://issues.apache.org/jira/browse/AMQNET-224
18526	AMQNET-206	I have a question concerning your unit tests: The session is in AcknoledgementMode "AutoAcknowledge": In that case the messages shoud automatically disappear from queue after receiption, or am I wrong ?! Anyway that's the behavior I'd expect?!	0	0	https://issues.apache.org/jira/browse/AMQNET-206
18527	AMQNET-206	After some research on the web, it seems that your implmentation is right. QueueBrowser does never remove messages from queue. So, I guess the best method to acknowledge messages is to store their JMSMessageId's while browsing and "consume" them with a MessageConsumer in a second round... Or does anybody knows a better way of achieving this (Because with that solution all messages to be acknowledged are downloaded twice...)?	0	0	https://issues.apache.org/jira/browse/AMQNET-206
18528	AMQNET-205	Tim, I found the following on MSDN: "The GZipStream class uses the gzip data format, which includes a cyclic redundancy check value for detecting data corruption. The gzip data format uses the same compression algorithm as the DeflateStream class." What do you think about using GZipStream instead of DeflateStream class? Reference: http://msdn.microsoft.com/en-us/library/system.io.compression.deflatestream.aspx	1	0	https://issues.apache.org/jira/browse/AMQNET-205
18529	AMQNET-201	That is because MSMQ is naturally one way, and that's because the way I understand it you use MSMQ, ActiveMQ, etc to apply load leveling functionality. Meaning, you off load the processing because it is generally too long for a client to wait for a response and you can load balance the processing as well as level it out as a response is not real time. Maybe I don't understand the customer driven motivation you mention. Why would they want to switch from request/reply done through WCF to use ActiveMQ? Why not just continue using the request/reply through WCF and increase the timeout values? If you are concerned about reliability of message transfer then you can enable reliability through the SOAP 1.2 endpoints. If you are concerned with ability to load level messaging, then why would you want to do request/reply with ActiveMQ over of point-to-point (one-way) or pub/sub? Yes ActiveMQ implements request/reply, but with .NET we have WCF to do it whereas not sure if other languages have such a technology.	0	0	https://issues.apache.org/jira/browse/AMQNET-201
18530	AMQNET-199	Can we document somewhere what this feature does? What does it do?	1	0	https://issues.apache.org/jira/browse/AMQNET-199
18531	AMQNET-198	I cannot use this workaround... the only open port is 61616... so I cannot access web console... I gave a try to the patch proposed in issue AMQNET-206... and it works! Could you consider to include it in release 1.2.0, please?	1	0	https://issues.apache.org/jira/browse/AMQNET-198
18532	AMQNET-159	Thanks Jim! Would you recommend just pulling from trunk to pick up this change? Any implications with picking up some of the completed items on 1.2 at all??? We're looking to go to production soon with the NMS provider and ActiveMQ.	1	0	https://issues.apache.org/jira/browse/AMQNET-159
18533	AMQNET-159	I reviewed the changes and found one difference. In FailoverTrasport.doConnect() if(_asyncConnect) { // now wait for transport to be populated, but timeout eventually allDone.WaitOne(_asyncTimeout, false); } you are passing false into an overloaded WaitOne method. I was not using this method. I wasn't passing in false just _asyncTimeout. Is there a specific reason this was done? If so, how come? If not, what are the implications of this? Also, would it make sense to make the async connection the default behavior?	1	0	https://issues.apache.org/jira/browse/AMQNET-159
18534	AMQNET-159	Okay. Thanks Timothy. Last question is whether to make this the default behavior then. Should it be opt in or opt out? Originally I thought opt in so as not to modify the default behavior of NMS ActiveMQ, but I don't see why anyone wouldn't want the provider to be faster connecting to the master broker when using the failover protocol.	1	0	https://issues.apache.org/jira/browse/AMQNET-159

#	Requirement	Questions	Answered	Successfully Answered	URL
18535	AMQNET-137	Regarding redelivery policy, currently client acknowledgement mode will not redeliver a message. There is no support of redeliveries. Would it be stretching NMS too far to allow to configure for a mode that "does" redeliver messages when the session is in client acknowledgement mode? If I understand correctly the redelivery logic is on the provider side and not the broker so perhaps this is possible. Straying too far from the java implementation wouldn't be a good thing though so would like everyone's opinion... Here is a discussion in the forum regarding the situation. http://www.nabble.com/Transactions-and-redelivery-td25915300.html We have coded a solution to redelivery optimistically or pessimistically with client acknowledgement mode. Optimistic will redeliver immediately before processing additional messages in the queue (like transactional acknowledgement mode). The message will not get ack'd until it exhausts all possible redeliveries. Pessimistic will simply clone the message, placing it at the end of the queue, and ack the current message. It will embed some metadata into the message and only redeliver (clone the message) up to the max redelivery count on the redelivery policy. Thoughts?	1	1	https://issues.apache.org/jira/browse/AMQNET-137
18536	AMQNET-129	It is possible to delete durable subscribers. Check the following API: ISession.DeleteDurableConsumer(). As far as deleting queues/topics, I will need to check on that. Just as background, what is the motivation for wanting to delete a queue? I also assume that you would want to delete a topic as well. If it is simply a matter of keeping things cleaned up, that I would ask if a temporary queue or temporary topic might better suit your implementation requirements?	1	1	https://issues.apache.org/jira/browse/AMQNET-129
18537	AMQNET-126	It appears that WCF does not support the request/reply model "The request-reply model is indeed inadequate for a queued transport (e.g. you can't block a thread while waiting for the response). You can correlate messages at the application level, typically using a durably stored correlation indicator (e.g. purchase order number). To process responses you would need a response queue and a service that would process messages sent to that queue." (http://social.msdn.microsoft.com/Forums/en-US/wcf/thread/2fb0aafd-078f-4638-bb99-372cbf0158fd/ for more details)	0	0	https://issues.apache.org/jira/browse/AMQNET-126
18538	AMQNET-105	If 1.0 isn't out yet, why should this deprecated method remain in 1.1? Why not schedule this fix for 1.0 with deprecation and then remove it for 1.1?	1	0	https://issues.apache.org/jira/browse/AMQNET-105
18539	AMQNET-100	Could you elaborate more on this request? What restrictions are you referring to? Could you show an example of the style you are looking for?	1	0	https://issues.apache.org/jira/browse/AMQNET-100
18540	AMQNET-97	This issue is in a fixed state, but should an enhancement issue be created to actually implement the QueueBrowser functionality in the ActiveMQ provider?	1	0	https://issues.apache.org/jira/browse/AMQNET-97
18541	AMQNET-93	Just to clarify, do you plan to mirror the current list of standard JMS exceptions in NMS? As for non-standard exceptions, perhaps wrap it in UnknownVendorException to the caller has an indication to do something special? Just for completeness the list of exception in EMS that don't map are AuthenticatoinExcetpion, CannotProceedExceptin, CommunicationException, ConfigurationException, InvalidNameException, ServiceUnavailableException.	0	0	https://issues.apache.org/jira/browse/AMQNET-93
18542	AMQNET-79	Awesome! What is the status of the contribution? Is it already part of Spring.NET? Feel free to post out to the Dev mailing list, or you can e-mail me directly if you like. I'll try and help out as I can.	1	1	https://issues.apache.org/jira/browse/AMQNET-79
18543	AMQNET-79	I have a (very!) basic implementation of WCF now : datagram only (i.e. IInputChannel/IOutputChannel), no request-response, no duplex, and sessionless. Which branch should I check it in to?	1	0	https://issues.apache.org/jira/browse/AMQNET-79
18544	AMQNET-42	I think this may be possible now that you have added support for STOMP 1.1. What do you think?	1	0	https://issues.apache.org/jira/browse/AMQNET-42
18545	AMQNET-27	I've added an ExceptionListener event on the IConnection which should serve a similar purpose to ExceptionListener in JMS. Does this seem an OK solution to you?	0	0	https://issues.apache.org/jira/browse/AMQNET-27
18546	AMQNET-26	replicate the functions in C#. Below are my comments as to the steps or actions required to fix this problem. If others can comment or correct my comments, then we can get started on this. If others are willing to help with the coding or testing, that would be great. All that I state below is what I have gleaned from the Java code. There is some interpretation of the code that may be in error. If so, then those with sufficient knowledge should correct my interpretation. A quick jump through the stack: We start with a connection factory derived from ActiveMQConnectionFactory() (C# ConnectionFactory()). This connection factory returns an IConnection which, as part of the process, creates an ITransport using a TransportFactory(). In Java, the resource information allows for various implementations of ITransport which includes FailoverTransport(). Different from C#, the Java implementation breaks out the logic for creating a transport so that it can be overridden by subclasses if desired. Not sure if we need that or not. In the TransportFactory, it all starts with the URI associated with the connection. The "failover:(URI1, URI2, ..., URIn)" syntax is passed to the TransportFactory.connect() to create the associated ITransport object. Looking at TransportFactory.connect() it uses findTransportFactory() to determine which class to load based upon the location passed. The URI.getScheme() method returns "failover" which is used to load the failover transport factory (org.apache.activemq.transport.failover.FailoverTransportFactory.java). This is based upon the META-INF information which redirects "failover" to that class. At this point we have a choice. We can allow for dynamic loading of classes (which can be done - not too hard) allowing for a similar run-time loading of appropriate classes to support various ITransport interface classes, or we can punt and do something easy for a compile-time loading of classes. My simple vote is to do a compile-time reference to the class which we can move to run-time loading at a future date. I have done run-time loading of classes, so if desired I can explain how I did it, but do we want that level of complexity at this point? Tabling that issue, the fundamental questions now reside around the differences between TransportFactory() and FailoverTransportFactory(), followed by the differences between Transport() and FailoverTransport(). The Java version of TransportFactory includes support for composite connections. This is used to support reliable and HA connections. Basically, composite connections represent a list of URIs associated with a connection. Most of the extended functionality of the transports is handled through subclassing. Want a ITransport that does X, then create a new subclass of Transport() or something that implements ITransport() and now you have a new feature X. However, there is a client-side and server-side for feature X (e.g. SSL). For SSL support, the client must understand how to connect properly, and the server needs to understand how to accept the connection properly. Thus some of the classes that support ITransport() also support TransportServer() which handles the server-side of things (I think this is correct). Not all features require this to work properly. For instance, the failover: capability is a client-only feature that does not require server-side coding. If we are to round-out all the neat features of the Java-based interfaces to be supported here with .NET, then we need to carefully support this dual concept of client- and server-side coding for the features. I think that is the level of complexity that is implied by all the features in the Java-based code. Essentially it breaks down into two sets of supported interfaces (Transport and TransportServer) which are required depending upon the specific feature. The rest of the feature code seems to be dependent upon the features being implemented. OK - so what does this mean for our implementation? I would suggest the following: 1. We create a Failover directory for our files with an implied "Failover" namespace extension. 2. Create a FailoverTransportFactory.cs and FailoverTransport.cs classes that will implement our new features (details to follow soon). 3. Explicitly reference this new namespace and based upon the schema passed either call TcpTransportFactory() or FailoverTransportFactory(). Using this ITransportFactory create the appropriate ITransport class. 4. As we add new features, we can then decide to continue with this	1	1	https://issues.apache.org/jira/browse/AMQNET-26

#	Requirement	Questions	Answered	Successfully Answered	URL
18547	AMQNET-26	Jim, Assuming I get somewhere with this how do I get the modified sources up to the system (or you)? I can do an SVN EXPORT and let you figure out where new files have been added, but would like to know what your preferred method is. I am still resolving some compile-time errors induced by my translation of the Java equivalent code to C#. If we had a sandbox SVN repository, I could check in my current snapshot for others to help. Jim, is something like that possible? If not, I hope to do some of my first tests later today. David, thanks for the offer. I would like your assistance if we can resolve a couple of these issues mentioned above. Assuming I get to the testing stage soon, it may be that your assistance with testing will be most valuable.	1	1	https://issues.apache.org/jira/browse/AMQNET-26
18548	AMQNET-26	I've just did an SVN UPDATE on my project tree and saw that there were many modifications performed by Jim in his preparation for a release. I was trying to merge his changes with mine but I cannot build the vendor portion (the NUnit libraries are missing). Jim, can you update me as to how to build this now? I can build the vendor .Net 2.0 library, but the test library refuses to build due to a lack of NUnit library. I presume if I get by this then the top-level project will build correctly. After a merge I can then generate a HEAD-level patch for us to use. David, please take a look at the patch and see if you can start seeing what I was doing. Or you may want to wait until I can get these changes updated to the HEAD version of the software.	1	1	https://issues.apache.org/jira/browse/AMQNET-26
18549	AMQNET-26	Clean checkout of HEAD does not build for me. I am missing the NUnit libraries, so all the TEST libraries cannot be built. Is there a simple way to build all without the TEST libraries being built? Or can we get the NUnit libraries included with the project? Or get instructions on what to do? Thanks, -Allan	1	1	https://issues.apache.org/jira/browse/AMQNET-26
18550	AMQNET-26	OK - I got it to compile. I now understand what Jim was doing in his reorganization of Apache.NMS. It used to be that the Apache.NMS portion was fully loaded under Apache.NMS.ActiveMQ as an external link. Now, only a fixed, deployed version of Apache.NMS is referenced by Apache.NMS.ActiveMQ. Because of that, and because that deployed version did not include .NET 2.0 CF, my builds were failing. Also, the nunit.framework.extensions.dll is needed by the Apache.NMS.ActiveMQ project. This required a change in the nant.build (patch attached). So, to get it to work for me I had to check out the Apache.NMS project (trunk) and build the the project (no problems there). I wanted to create the "deploy" directories but the only target that would do so is "deploy-all". This also does an SVN COMMIT which is not what I want to do. So I created a new target called "deploy-local" which is called by "deploy-all" so that I could do what was needed without the SVN COMMIT. Is there a better way to do this? After copying the files from Apache.NMS to Apache.NMS.ActiveMQ, I could now build the Apache.NMS.ActiveMQ project after making the nunit change referenced above (patch attached). From here, I shall attempt to add my previous patches for failover support. Since the project is in two pieces, I'll need to break up my previous patch into smaller pieces that can be applied to each separately.	1	1	https://issues.apache.org/jira/browse/AMQNET-26
18551	AMQNET-26	Since I had a hand in this code, would you mind posting the complete URL string that you are using? Also, when does the failure occur? During ConnectionFactory(url)? CreateConnection()? The changes in URISupport should remain (mostly) compatible with the previous version. But there was some code changed in the CreateConnection() call that dealt with URL processing. Having this additional information would go a long way to understanding and fixing this problem.	1	1	https://issues.apache.org/jira/browse/AMQNET-26
18552	APLO-288	Did you try: http://activemq.apache.org/nms/ which has a STOMP library Apache.NMS.Stomp.	0	0	https://issues.apache.org/jira/browse/APLO-288
18553	APLO-280	Hi. Does Apollo supports message groups with advanced settings like a TTL for a message group or sequence reset (Like Active MQ does, With the JMSXGroupSeq = -1 thing)? Thanks.	0	0	https://issues.apache.org/jira/browse/APLO-280
18554	APLO-267	I need to send messages between JMS and STOMP (JMS <-> TOPIC <-> STOMP (WebsocketClient)), but it is not working. I did try with ActiveMQ 5.8 and Apollo 1.6 with the current WebSocket-Client from Apollo 1.6. What i did find out: * Content-Length as described in http://activemq.apache.org/stomp.html !2013-09-04 12_07_39-Apache ActiveMQ-Stomp.png! ** but how do you remove the content-length header property? Parameter in the connection!? * Workaround for STOMP -> JMS in Ruby: http://www.juretta.com/log/2009/05/24/activemq-jms-stomp/ * Stackoverflow: http://stackoverflow.com/questions/13401374/activemq-to-apollo-transition-openwire-to-stomp-protocol-configuration * Problem is reproduceable, Java class and Websocket-Client is attached to this ticket and they are very simple. Should i workaround and try to remove the header property content-length from JMS side (TextMessage) and STOMP to be able to communicate?	0	0	https://issues.apache.org/jira/browse/APLO-267
18555	APLO-262	Patch to include: [addition] ProtocolFactoryTest [modified] OpenwireProtocolHandler [modified] OpenwireParellelTest [addition] openwire-features.md The openwire-features file can be viewed by running jetty:run in the apollo-website module and navigating to http://localhost:8080/documentation/openwire-features.html Let me know how we should include it in the main docs: Should we split out the STOMP docs into its own file? and link to both stomp and openwire from the main doc file (user-manual.md)	1	1	https://issues.apache.org/jira/browse/APLO-262
18556	APLO-257	Lionel, Is this something that happens regularly? Any other hints (machine specs, etc) for how to create this? I've been trying and cannot recreate it yet (using the stomp benchmark from APLO-176)	1	1	https://issues.apache.org/jira/browse/APLO-257

18564	APLO-177	The NPE was getting generated due to the 'add_user_headers' option. This should now be fixed in build 289 [1]. What did you expect the user header to get set to? You would need to have an authenticated user. Luckily, you can add a login/passcode header to the message to authenticate each UDP message. [1]: https://builds.apache.org/job/ActiveMQ-Apollo-Deploy/289/console	1	1	https://issues.apache.org/jira/browse/APLO-177
18565	APLO-177	Are you using a default login.config ??	1	1	https://issues.apache.org/jira/browse/APLO-177
18566	APLO-176	No, those are NOT really harmless. The in memory queue swaps blocks of messages out to disk but keeps track of the number of messages and bytes in that are contained in the block. At a later time when the a message from the block is needed, the block is loaded back up from the store and we compare the number of messages and bytes that we were able to load from the store to the expected size of the block. If there is a difference the queue adjust it's internal counters to account to the change. Why, does it do this? This was put in place so that a queue could tolerate if a 3rd party changed the message store directly (For example purged a store of all the messages in a queue). Is this normal in your case? No. I would NOT expect the LevelDB store and BDB stores to be inconsistent since they don't support external management. Now that hard part.. Whats the easiest way I can reproduce this? What kind of messaging scenarios is this running? Do all your brokers do this?	1	1	https://issues.apache.org/jira/browse/APLO-176
18567	APLO-176	Hi Lionel, Have you guys seen this anymore?	1	1	https://issues.apache.org/jira/browse/APLO-176
18568	APLO-176	Hi Richard, What version are you using?	1	1	https://issues.apache.org/jira/browse/APLO-176
18569	APLO-169	If the keystore is configured with two or more certificates, how does the broker pick which to use as the broker's cert?	1	0	https://issues.apache.org/jira/browse/APLO-169
18570	APLO-166	Once the OpenWire protocol if fully implemented and documented :) When will that be? Since Apache is a volunteer organization, it's hard to say when it will be completed. I can just tell you what the current state its. I would classify the current state of the OpenWire Protocol as being alpha/beta quality. It does not net support XA transactions and not all use cases are fully unit tested. Since the initial focus will be to to just make it feature and backward compatible, we probably will not be focusing on optimizing the OpenWire performance until thats done. ActiveMQ development will NOT stop. It has a large user based and we will continue to incrementally improve that code base. Apollo is jus providing a fresh new platform to do some things better.	1	1	https://issues.apache.org/jira/browse/APLO-166
18571	APLO-158	STOMP over websockets has been supported since the 1.1 release. Most modern browsers support WebSockets, should we even take the time to implement AJAX interface?	1	0	https://issues.apache.org/jira/browse/APLO-158
18572	APLO-131	Hi Lionel, I just tried manually testing durable subs against the latest build and i did not see any errors. Have you tried deleting the data directory (there have been some schema changes recently)? Is it reproducible? How?	1	1	https://issues.apache.org/jira/browse/APLO-131
18573	APLO-93	Here's a patch, the current openwire tests still work. However I notice there's an occasional NPE: Exception in thread "hawtdispatch-DEFAULT-1" java.lang.NullPointerException at org.apache.activemq.apollo.broker.protocol.HeartBeatMonitor.schedual_check_writes(HeartBeatMonitor.scala:43) at org.apache.activemq.apollo.broker.protocol.HeartBeatMonitor$$anonfun$start$1.applymcVsp(HeartBeatMonitor.scala:71) at org.fusesource.hawtdispatch.package$$anon$4.run(hawtdispatch.scala:347) at org.fusesource.hawtdispatch.internal.TimerThread$2.run(TimerThread.java:153) at org.fusesource.hawtdispatch.internal.SerialDispatchQueue.run(SerialDispatchQueue.java:83) at org.fusesource.hawtdispatch.internal.pool.SimpleThread.run(SimpleThread.java:61) Think it would be safe to break out of the schedual_check_read/schedual_check_write loop in this case? I suspect this is just because the connection is torn down before the monitor has checked the connection.	1	1	https://issues.apache.org/jira/browse/APLO-93

#	Requirement	Questions	Answered	Successfully Answered	URL
18574	APLO-28	the page has been started.. http://activemq.apache.org/apollo/versions/1.0-SNAPSHOT/website/documentation/extending-guide.html We should also document how to add custom stores, protocols, and transports.	1	0	https://issues.apache.org/jira/browse/APLO-28
18575	APLO-6	Hey Sam, Where do you think would be the best place to configure that option? A a broker level? Per connector? Per client?	1	1	https://issues.apache.org/jira/browse/APLO-6
18576	APLO-6	Hi Hiram, thanks for the fix. As I'm not familiar with JVM, can you give an example of how this option is set please?	1	0	https://issues.apache.org/jira/browse/APLO-6

It is a journal sampling profiler and the ideas on how it works are taken from: - https://linux.die.net/man/1/perf-record - https://github.com/jvm-profiling-tools/honest-profiler But in the future I'm planning to provide a single CLI command that could collect perf data using a filter of some kind or different CLI commands for macro profiling areas ...it is something I want to discuss on the dev list...	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1185
18578	ARTEMIS-1185	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/1295 what I am missing: - doc how to use this... (is that internal only)? - how to read the file... I am a bit confused with the file format... Also, it would be nice to be allowed to configure where the file would be generated.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1185
18579	ARTEMIS-1185	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/1295 @franz1981 I was just looking from the POV of the code.. TimedBuffer->profiler (whatever the name is) is instantiating an output file. shouldn't it be configurable for the running server? the CLI to read it could also get the file from the configuration if you're running from the instance.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1185
18580	ARTEMIS-1185	Github user franz1981 commented on the issue: https://github.com/apache/activemq-artemis/pull/1295 @clebertsuconic It is something I think can over-complicate the environment setting for a user and could potentially makes the mechanism less efficient too. That's why: - the file is not a "real" file on Linux (it uses [/dev/shm](https://www.cyberciti.biz/tips/what-is-devshm-and-its-practical-usage.html)) to avoid potential costs on page swapping/writeback of the dirty region, hence the position/name could not be bound to a fixed configured position - the file need to be zeroed on broker start and to make this behaviour safer&simpler to be implemented I prefer to let the file system do it for me, creating a new file with `pid-date of creation` info on the name (+ File::deleteOnExit), hence a fixed file name is not an option here too wdyt?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1185
18581	ARTEMIS-1185	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/1295 @franz1981 the only reason I didn't merge this is that this would be a hidden feature... no docs.. can you add a doc chapter about this?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-1185
18582	ARTEMIS-1185	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/1295 @franz1981 you are misunderstanding me.. the CLI won't ever run concurrently with the server.. it's an issue on your CLI.. you are holding the lock on the server.. hence you're not able to capture it.	0	0	https://issues.apache.org/jira/browse/ARTEMIS-1185
18583	ARTEMIS-1185	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/1295 @franz1981 I tried.. cannot run .. because of the lock... lets just talk over tomorrow..	0	0	https://issues.apache.org/jira/browse/ARTEMIS-1185
18584	ARTEMIS-1185	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/1295 I think this could be made a bit more generic.. So I have moved the file creationg to MultiCastBuffer. This could be extended to other measures.. E.G. Message sending and consuming... etc.. etc... So, right now the logic for missing measures is inside FlushSampleFlyweight.. while it should / should be at the buffer... I still think we should name this PipedBuffer.. you could create many pipes. .one for the journal, one for messages.. .etc.. etc... it's a pipe of information.. where you can have multiple receivers... if you create a chain of information (I'm calling pipe.. we can find other names) for messages.. it could be there... Or maybe we could make this generic for not just the journal.. .and still have a single File.	0	0	https://issues.apache.org/jira/browse/ARTEMIS-1185
18585	ARTEMIS-1179	Github user jbertram commented on the issue: https://github.com/apache/activemq-artemis/pull/1288 Clear the caches when the session is closed?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1179
18586	ARTEMIS-1179	Github user michaelandrepearce commented on the issue: https://github.com/apache/activemq-artemis/pull/1288 When a session is closed it's thrown away right, and you make a new session. Would that not be redundant?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1179
18587	ARTEMIS-1179	Github user michaelandrepearce commented on the issue: https://github.com/apache/activemq-artemis/pull/1288 oh yeay sevntu not available again.... [ERROR] Unresolveable build extension: Plugin org.apache.felix:maven-bundle-plugin:3.3.0 or one of its dependencies could not be resolved: Could not find artifact org.apache.felix:maven-bundle-plugin:jar:3.3.0 in sevntu-maven (http://sevntu-checkstyle.github.io/sevntu.checkstyle/maven2) @ On a serious note, it seem this tool in the repo, isn't reliable, this isn't the first time I've seen this issue or others have. How much real value is it adding?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1179
18588	ARTEMIS-1174	That's an easy change.. doesn't even need a JIRA... why don't you just send a PR? or it needs some extra work?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1174

18589	ARTEMIS-1163	Github user klausboeing commented on the issue: https://github.com/apache/activemq-artemis/pull/1269 @jbertram I made the adjustments as needed. How will the ARTEMIS-1163 ticket be processed? Thanks for listening.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1163
18590	ARTEMIS-1162	Github user franz1981 commented on the issue: https://github.com/apache/activemq-artemis/pull/1268 @michaelandrepearce Nope, no problem for me...but I'm not 100% sure is the best way to do it: changing the new one to be like the original one is a matter of 1 line change and a boolean flag to be put in the right spot. Instead of having: ``` if (checkpoint || currentPendingSyncs >= estimatedOptimalBatch) { ``` Need to be changed into: ``` if (checkpoint || (smartCoalescing && currentPendingSyncs >= estimatedOptimalBatch)) { ``` Finished. Now you have one implementation that cover the 2 behaviours. wdyt?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1162
18591	ARTEMIS-1157	Can you work up a test (perhaps based on one of the examples shipped with Artemis) which demonstrates the issue?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1157
18592	ARTEMIS-1157	Based on the examples is a bit difficult for us. ArtemisMqCrashDemoClient.java is the client code. Client is consuming the keystore from: src/test/resources/artemis-key.jks. Now, if the client makes a second connection from the same factory, he runs in the stacktrace provided as comment in the file. broker.xml is the server. We are using a shared-store and inside the <cluster-connections> we reference one live- and backup connector. The configured keystorepath defined on <connector name="netty-live-connector"> is getting propagated to the client but of course, at the path: /etc/pki/tls/cert/node1.client.jks is no keystore on the client-side. We know, that for this client code provided in ArtemisMqCrashDemoClient.java we could resolve it by using: -Dorg.apache.activemq.ssl.keyStore=src/test/resources/artemis-key.jks but what should we do if the same JVM needs to connect to a different broker with a different keystore?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-1157
18593	ARTEMIS-1157	bq. Imagine a broker sets in the cluster-connector - lets say one or two cipher suites with the property: enabledCipherSuites=TLS_AES_WITH... Now if the clients JRE - for whatever reason - does not support that cipher suite (JRE to old, disabled in JRE security settings, JRE from vendor that does not support it at all...) In that case, the initial connection from the client will work, but as soon as a failover occurs, client connection fails. Couple of things: - What's the use-case where you'd want to set {{enabledCipherSuites}} on a connector and _not_ set it on the corresponding acceptor? - What's the use-case where different cluster nodes would support different cipher suites. I understand both of these use-cases are technically possible, but at this point they don't make sense to me so I'm not inclined to consider them worth supporting. bq. Another thing is: clientA -> HA-brokerA -> Bridge -> HA-brokerB -> clientB. This is a simple setup but consists out of 4 independent components and each component is high-available so in the most basic case this will result in 8 Boxes (VM's, containers, whatever...). I'm confused about this use-case. I assume the "4 independent components" here are clientA, HA-brokerA, HA-brokerB, & clientB. I don't understand how that results in 8 boxes since typically only the brokers would consist of a live/backup pair. Also, is the "Bridge" a cluster bridge (which is automatically configured by the internal cluster manager) or a bridge defined in broker.xml explicitly? bq. Configuring all this systems in a consistent way in large organisations can be challenging. Because if just one component is configured the wrong way, initially everything works but as soon as a failover occurs, the system stops working. As long as the brokers are configured consistently (which is the recommendation), for example using the same value for enabledCipherSuites on their acceptors, then any client that can't connect to the backup will also fail to connect to the live. bq. I just want to highlight here, that the current concept can be "complicated/intransparent"... The SSL use-case here certainly isn't the most elegant, but given the broker's clustering design I can't think of anything better at this point (and I'm not convinced I need to at this point). bq. This will also require a lot of testing every time you change something. I think this is a bit of an overstatement. As stated before, the recommendation is for all cluster nodes to be configured equivalently. If that recommendation is followed then I think you can avoid most of the issues you've identified here. Transparent/automatic functionality like fail-over and connection load-balancing assumes equivalent configuration between nodes. I believe this is the case for most software that provides similar functionality.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1157
18594	ARTEMIS-1157	> I understand both of these use-cases are technically possible, but at this point they don't make sense to me so I'm not inclined to consider them worth supporting. You are right, it actually doesn't make sense to me, if I now read it again, I would have the same question: why should you do this. > As long as the brokers are configured consistently (which is the recommendation), for example using the same value for enabledCipherSuites on their acceptors, then any client that can't connect to the backup will also fail to connect to the live. Also here. Maybe we do something, that isn't best practice. To sum this up: At the end of the day, the client needs the keystore (the file) present on the client machine to connect (to live or backup). This file needs to be at the same location where the HA-broker is getting it from (except system property overwrite). If the password for the keystore should not be transmitted over the network, we overwrite it, again, with system properties on both ends and do not specify it in the connector definition (client and broker, that should work right?). We were somehow fixed to the idea, that client and broker decide on it's own, where to find it's own keystore/password combo. Thanks for your patience ;-) Best, Philipp	1	0	https://issues.apache.org/jira/browse/ARTEMIS-1157
18595	ARTEMIS-1156	Github user michaelandrepearce commented on the issue: https://github.com/apache/activemq-artemis/pull/1263 @franz1981 just updated to add in the journal compactor. I ran out of time today, to deploy and run this with a profiler on our servers to verify that this hasn't pushed the auto boxing further down or else where, i will do this tomorrow. In particular can you look at the way i have handled addAll for the NonBlockingHashSetLong, is there a better way? Also for the HashMap that had long keys in the journal which is not concurrent, I've used the LongHashMap from netty.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1156
18596	ARTEMIS-1156	Github user clebertsuconic commented on a diff in the pull request: https://github.com/apache/activemq-artemis/pull/1263#discussion_r115794851 --- Diff: artemis-journal/src/main/java/org/jctools/maps/NonBlockingHashSetLong.java --- @@ -0,0 +1,105 @@ +/* + * Licensed under the Apache License, Version 2.0 (the "License"); + * you may not use this file except in compliance with the License. + * You may obtain a copy of the License at + * + * http://www.apache.org/licenses/LICLongNSLong-2.0 + * + * Unless required by applicable law or agreed to in writing, software + * distributed under the License is distributed on an "AS IS" BASIS, + * WITHOUT WARRANTILongS OR CONDITIONS OF ANY KIND, either express or implied. + * See the License for the specific language governing permissions and + * limitations under the License. + */ +package org.jctools.maps; + +import java.io.Serializable; +import java.util.AbstractSet; +import java.util.Iterator; + +/** + * A simple wrapper around {@link NonBlockingHashMapLong} making it implement the + * {@link java.util.Set} interface. 18597	ARTEMIS-1156	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/1263 @michaelandrepearce Oh.. never mind.. I can ammend during checkout.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1156
18598	ARTEMIS-1156	Github user franz1981 commented on the issue: https://github.com/apache/activemq-artemis/pull/1263 @michaelandrepearce Got it, there is another effective solution to this: build an interner, similar to a StringInterner, but with a different hashed logic in order to avoid the JVM duplicating autoboxed instances each time. Few lines of code to explain it better: ``` //it will retain in LRU fashion the last 64 Long instances LongInterner longCache = new LongInterner(64); long id; //instead of: put(id , connection); //interned instance Long cachedId = longCache.intern(id); put(cachedId, connection); ``` wdyt? The caching/escape analysis are different things AFAIK: - caching is performed by the library on long->Long, and put by the compiler when autoboxing (eg [Long::valueOf](http://grepcode.com/file/repository.grepcode.com/java/root/jdk/openjdk/8u40-b25/java/lang/Long.java#837)) - [escape analysis](http://docs.oracle.com/javase/7/docs/technotes/guides/vm/performance-enhancements-7.html#escapeAnalysis): newly created Long instances no longer exists on the heap but being unpacked on the stack if used temporary, but need to call by hand new Long(long), bypassing the cached logic and do not retain it (seems not our case anyway) eg http://www.rationaljava.com/2015/12/how-long-does-it-take-jvm-to-effect.html	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1156
18599	ARTEMIS-1156	Github user michaelandrepearce commented on the issue: https://github.com/apache/activemq-artemis/pull/1263 So we have: 1. primitive collections 1. id's as objects (Long in this case) 1. flywheel/interning caching pattern For 1: we have tried, looks good as long as we just do hot paths, can very quickly over complicate our code, or start bringing negative effects. For 2: I haven't had a chance to see how much work, but this maybe simpler/cleaner imho. Though does lend its self to people in future accidentally introducing the boxing issue again. For 3: Should work nicely, but only upto a predefined cache size. e.g. what occurs if cache size is N and i end up with N+1000 longs, we end up in same position as with Long.valueOf. Also some complexities introduced, how big should the cache be? how does someone tune it, i run a very large vm, but fred runs a small one, this works for an app that you deploy just in your own DC, but I'm weary of setting a magic cache size where it gets deployed in many differing env's. For this reason, id personally favour looking into option 2, then keeping a low scoped option 1.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1156
18600	ARTEMIS-1156	Github user franz1981 commented on the issue: https://github.com/apache/activemq-artemis/pull/1263 Have you taken a look to http://fastutil.di.unimi.it ?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1156
18601	ARTEMIS-1156	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/1263 @michaelandrepearce merged... did some tweaks to preserve history on TypedProperties.. all merged now... #	Requirement	Questions	Answered	Successfully Answered	URL
18614	ARTEMIS-1129	Github user gemmellr commented on the issue: https://github.com/apache/activemq-artemis/pull/1272 Would an alternative be just offering a separate client binary convenient download, rather than just the single all-inclusive archive? Or documenting a maven command to gather all the current jars needed for a given client release? Those wouldn't really be any harder to actually use than the single jar in the end, but would avoid needing new uber jars that could end up being a little fragile given all the shading config used to create them and going much less tested than the main modules. Setting that aside, I notice there are various profiles specifying modules in the pom, and I wondered if it is sufficient to only add these new ones in the one place as done, or if they also need added to some of the other profiles? Not sure exactly what they all do.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1129
18615	ARTEMIS-1129	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/1278 @michaelandrepearce Shade is generating a few files at the sub-modules directories (see the changes). this was failing: ``` mvn -Ptests test ``` I only ran the examples before.. and the build is now broken without this. do you think these changes are ok? I'm concerned also that the release would generate these files on the source profile. Something to be checked also.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1129
18616	ARTEMIS-1129	Github user michaelandrepearce commented on the issue: https://github.com/apache/activemq-artemis/pull/1278 @clebertsuconic def agree that it should be git ignore , as it is generated at build time. are you saying by adding this exclusion in rat list, the tests break, or without adding it it breaks? i am just running the build with the -Ptests profile now, waiting for it to complete locally. I know there is the setting dependencyReducedPomLocation which allows you to move it to another directory, problem is this breaks any remaining build process and marked buggy in the shade plugin docs so i don't think we should look at that.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1129
18617	ARTEMIS-1129	Github user michaelandrepearce commented on the issue: https://github.com/apache/activemq-artemis/pull/1278 @clebertsuconic I'm happy with this change. I have a few more tidy up bits, been working on, as have been exploding the jars to check whats copied in and some bits like notice and license and a load of crud from jgroups, whilst still waiting the -Ptest to complete... shall i raise a pr to your branch or direct to master?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1129
18618	ARTEMIS-1124	Github user mtaylor commented on the issue: https://github.com/apache/activemq-artemis/pull/1217 @franz1981 two comments here. 1. The network time out should also be used on the page store. 2. The default timeout is 20seconds but the docs says 30s. I'll merge this as it is as the doc is a minor fix and page can be added later. Can you follow up with a patch for this. Thanks	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1124
18619	ARTEMIS-1116	Github user jbertram commented on the issue: https://github.com/apache/activemq-artemis/pull/1206 Couple of things: - The commit message should follow the format outlined in the [Hacking Guide](https://github.com/apache/activemq-artemis/blob/master/docs/hacking-guide/en/maintainers.md#commit-messages). - You have a fair number of checkstyle violations. See more [here](https://builds.apache.org/blue/organizations/jenkins/ActiveMQ-Artemis-PR-Build/detail/ActiveMQ-Artemis-PR-Build/2607/pipeline). You run the checkstyle stuff locally by using 'mvn -Pdev install'. - I wonder if this feature would be better if it was more general so that it could be used with any login module rather than isolated only to the LDAP login module. What do you think?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1116
18620	ARTEMIS-1116	Github user sjhiggs commented on the issue: https://github.com/apache/activemq-artemis/pull/1206 That's fine, I was assuming "from" was the external/LDAP role and "to" is the internal AMQ role, do you see it the opposite?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1116
18621	ARTEMIS-1116	Github user jbertram commented on the issue: https://github.com/apache/activemq-artemis/pull/1206 > I was assuming "from" was the external/LDAP role and "to" is the internal AMQ role, do you see it the opposite? I see the "from" was the external role and "to" is the internal Artemis role as you said. > ...the from will probably need a different delimiter because the role name may be something like a DN. Whatever makes sense from an implementation perspective is fine with me. I was just going on the fact that the original commit used commas as a delimiter.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1116
18622	ARTEMIS-1110	This looks done. Can you confirm?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-1110
18623	ARTEMIS-1096	[~jbertram], can global-max-size have a computed default (or at least a safe default), so that an explicit -1 remains a legal way to disable the limits?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-1096
18624	ARTEMIS-1096	[~jbertram], one more question. Regarding your first paragraph - I was under the impression that max-size-bytes=-1 at the address level would defer to the global limit, and you would eventually trigger paging or blocking this way. Is that correct? I think I saw the broker behave this way in my testing.	1	0	https://issues.apache.org/jira/browse/ARTEMIS-1096
18625	ARTEMIS-1096	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/1196 Please.. don't merge this	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1096
18626	ARTEMIS-1087	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/1166 Why don't you use the properties, and allow it through URI?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1087

18640	ARTEMIS-1002	Github user mtaylor commented on the issue: https://github.com/apache/activemq-artemis/pull/1053 @clebertsuconic The difference is that the DEFAULT pooled is platform specific on whether to use direct buffers or not. We specifically switch this to false in the PartialPooledByteBufAllocator. Could this be an issue here?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1002
18641	ARTEMIS-1002	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/1053 @mtaylor Oh.. right... I actually read it org.apache.activemq.core.client.. something like that... that's the one class I saw it.. but I confused the usage.. my bad!	1	1	https://issues.apache.org/jira/browse/ARTEMIS-1002
18642	ARTEMIS-995	Github user clebertsuconic commented on a diff in the pull request: https://github.com/apache/activemq-artemis/pull/1044#discussion_r102959366 --- Diff: artemis-junit/src/test/java/org/apache/activemq/artemis/junit/MultipleEmbeddedActiveMQResourcesTest.java --- @@ -38,6 +38,11 @@ static final String ASSERT_RECEIVED_FORMAT = "Message should have been received from %s"; static final String ASSERT_COUNT_FORMAT = "Unexpected message count in queue %s"; + static { + ThreadLeakCheckRule.addKownThread("MemoryPoolMXBean notification dispatcher"); --- End diff -- Isn't there a way to kill these threads?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-995
18643	ARTEMIS-995	[~eduda] do you have more coming before the release? should I close this? We can keep this open and if you send more JIRAs on this type of fix.. we can keep this open until the release if you have more coming.	1	0	https://issues.apache.org/jira/browse/ARTEMIS-995
18644	ARTEMIS-994	In situations like this where changes are really only to gain performance I like to quantify the use-case and goals as much as possible. I assume you've done benchmarking for your use-case and determined that the current implementation does not meet your performance goals. Can you provide details on your specific use-case, how you tested performance, what numbers you received, and what numbers you hope to achieve with these changes?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-994
18645	ARTEMIS-994	[~jbertram] I/O is I/O.. there's nothing you can do to improve performance on the IO itself.. you have a physical medium somehow, right? Either a DISK, a SSD, a Network sending waves, whatever you do you can't go faster than physical barriers.. What you can do is use less CPU and generate less Garbage on the process... I have seen the implementation when Norman was still at RedHat writing it, and we have good indications that this will happen. If we can use less CPU and generate less Garbage that will generate better throughput on the system, and there is only one way to measure that.. we implement the thing and use benchmarks to measure the gain. Francesco has a few written on his github that we can reuse.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-994
18646	ARTEMIS-994	{quote} ...use benchmarks to measure the gain. {quote} This is essentially what I'm asking about, although you're talking about retro-active benchmarking. I'm asking about pro-active benchmarking - the kind of benchmarking that would allow one to identify a performance bottleneck for a particular use-case. In any case, were going to want to perform benchmarking to understand what kind of gains this change will make and what use-cases it will benefit the most. I'm not naive enough to believe it will be the best option for any and all use-cases. If we can acquire data on this front "for free" from someone who's already done it (e.g. [~michael.andre.pearce]) then so much the better. Do you think this is a waste of time, [~clebertsuconic]?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-994
18647	ARTEMIS-994	[~michael.andre.pearce], do you have information on how to reproduce the stack-trace detailed in your earlier comment?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-994
18648	ARTEMIS-994	[~norman] I notice going back through git history it once had @author as you in the code. Also i guess you're very familiar with the native netty epoll ;) writing that also. Do you have any comments on the above, and the issue we hit? Is what I've done to get around the issue sensible?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-994
18649	ARTEMIS-994	[~clebertsuconic] thanks, i have removed this class now, and my branch is uptodate. Doing a mvn clean install, succeeds since removing this i assume this runs all the tests you mention. What should we do next, shall i make PR?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-994
18650	ARTEMIS-994	A PR is good... we may work beyond it... but it's a good start.. it would preserve your authorship.. and we may go beyond it with config options.. etc...	1	1	https://issues.apache.org/jira/browse/ARTEMIS-994

#	Requirement	Questions	Answered	Successfully Answered	URL
18651	ARTEMIS-994	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/1093 I am running the testsuite, and if everything is ok I should merge it tomorrow... I have 50% of tests running and so far so good.. will know in 2 hours... BTW: can you run these commands please? ```sh git pull -rebase upstream master git push origin -f {your branch name} ``` and then: ```sh git rebase -i upstream/master ``` And squash these committs into one, with a description that matches it? I could do this myself, but I would rather have you finding the best commit name once you squash them.	1	0	https://issues.apache.org/jira/browse/ARTEMIS-994
18652	ARTEMIS-994	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/1093 @michaelandrepearce I don't think you really need three parameters for this... just one would do... - useEpoll... the other two you introduced could just use the same parameter, being the same semantic.. being just epoll. That way you would configure to use epoll or not with a single switch. If you need to configure different settings.. than you can just update the values.. it gets easier on users IMHO. WDYT?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-994
18653	ARTEMIS-994	Github user michaelandrepearce commented on the issue: https://github.com/apache/activemq-artemis/pull/1093 @clebertsuconic I notice this didn't get merged still. Did I miss understand and you expected me to make the configuration changes? if so no worries, just let me know.	1	0	https://issues.apache.org/jira/browse/ARTEMIS-994
18654	ARTEMIS-994	Github user michaelandrepearce commented on the issue: https://github.com/apache/activemq-artemis/pull/1093 @clebertsuconic i just did a complete fresh clone and rebuild of this PR/My branch which i rebased the other day. It still built ok for me. Should i rebase again? Maybe some commit in the last few days might have broken something?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-994
18655	ARTEMIS-994	Github user michaelandrepearce commented on the issue: https://github.com/apache/activemq-artemis/pull/1093 Many thanks Clebert. Had a brief look over tonight. Seems good. Will spend a bit more time tomorrow and also take the chance to update my fork. Sent from my iPhone > On 24 Mar 2017, at 00:47, clebertsuconic <notifications@github.com> wrote: > > > Please review master ? > > — > You are receiving this because you were mentioned. > Reply to this email directly, view it on GitHub, or mute the thread. >	0	0	https://issues.apache.org/jira/browse/ARTEMIS-994
18656	ARTEMIS-948	Couple of questions: # What is triggering the creation of the destination? Is it a producer sending a message or consumer being created? # If JConsole doesn't list the destination how do you know it is being created? # Do you want "topic" semantics? If so, why are you using a destination prefixed with "jms.queue." (which will have queue semantics)? # Do you have a reproducible test-case you could provide?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-948
18657	ARTEMIS-948	You should use the user's list to ask question, only open JIRAs for confirmed bugs please. Can we close this?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-948

18674	ARTEMIS-878	Github user clebertsuconic commented on a diff in the pull request: https://github.com/apache/activemq-artemis/pull/924#discussion_r92696163 --- Diff: artemis-cli/src/main/java/org/apache/activemq/artemis/cli/commands/queue/UpdateQueue.java --- @@ -31,7 +31,7 @@ String name; @Option(name = "--deleteOnNoConsumers", description = "whether to delete when it's last consumers disconnects") - Boolean deleteOnNoConsumers = null; + String deleteOnNoConsumers = null; --- End diff -- look at Create, allow-anonymous | --require-login (Remember when I talked about being creative ? :)) anyways.. I was looking into this, and I found a better way to address this, by using inputs on certain defaults.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-878
18675	ARTEMIS-873	[~jmesnil], I considered this when I implemented it, but the main impetus for this was parity with 5.x which uses the 1024 multiple. I didn't want a disparity in actual behavior given the same abbreviation. That said, if the community agrees with your suggestion I'm happy to implement it. Would you mind raising a \[DISCUSS\] thread on the user mailing list and making your proposal?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-873
18676	ARTEMIS-873	I'm starting to agree with Jeff on this. What about timeouts... if you define 3K Seconds it should be 3000 seconds and not 3 * 1024 seconds. What should we do.. K should mean 1024 on bytes, and 1000 on other values? it sounds horrible that way. Time for a DISCUSS thread?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-873
18677	ARTEMIS-869	I'm not clear on how "having the delivery mode explicitly part of the API" is actually more user friendly than simply using the existing setting. Can you elaborate on that point?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-869
18678	ARTEMIS-865	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/896 nice one.. thanks	1	1	https://issues.apache.org/jira/browse/ARTEMIS-865
18679	ARTEMIS-843	The JMS API from Oracle is licensed with the CDDL which requires some special care when including in an Apache product. My guess is that's why it wasn't used originally. In any case, can you elaborate on what you mean by "things become complicated because of that"? To my knowledge ActiveMQ has always used JMS specs from Geronimo (many Java EE application servers have their own versions of the specs).	0	0	https://issues.apache.org/jira/browse/ARTEMIS-843

#	Requirement	Questions	Answered	Successfully Answered	URL
18680	ARTEMIS-843	In my case its netbeans platform environment which does not like when packages being imported by more than one module. And it does not help in any way, it just complains. To find out which deps have those packages, check versions, find the version, which suits all the JMS impls, find repos and register them, exclude this jms dep, include mine, retest all its users - I ment all these fun stuff I had to find out what geronimo is and check if it is actually THAT jms, or what? If its that jms then why it was repackaged? - it was not obvoius at all And geronimo seems dead since 2013	0	0	https://issues.apache.org/jira/browse/ARTEMIS-843
18681	ARTEMIS-843	I suppose strange is relative. As I indicated before, the Geronimo project serves as an umbrella for Java EE specs for the Apache community. Therefore most, if not all, Apache projects that need Java EE specs use the ones from Geronimo. That list includes Artemis, of course, as well as ActiveMQ 5.x, Apollo, Camel, Qpid JMS, etc. Back when I worked on HornetQ it used the JMS spec from JBoss. I'd say this practice is fairly common in larger communities like Apache and JBoss.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-843
18682	ARTEMIS-839	I am pretty sure I had this somewhere else. The only issue to do this would be when transactions are involved. Which journal would you keep the transactions? I guess we could still have the main journal acting as the TX coordinator and have IDs registered.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-839
18683	ARTEMIS-839	What's the status on this? We have found we are maxing out at 50k msg/sec (durable) with ssd, we tried raiding but the raid over head was actually detremental. As such we cannot benefit by having multiple disks to get more performance. Where as if we could have multiple journal dirs then we could obviously make use because we just mount the disks direct and get total durable throughput higher. This would be akin to some high performance databases do like aerospike etc.	1	0	https://issues.apache.org/jira/browse/ARTEMIS-839
18684	ARTEMIS-839	[~jbertram] we're running durable persistent messages in sync send over many clients, ramping up the clients as it progresses, what we note is essentially the disk is bottle neck, surprise surprise. Because of the disks we have the raid stack overhead actually degrades the performance we're getting. This is exact reason why other tech like the one i noted have started to look to support JBOD disks for their persistent areas and itself stripe the data it needs to write. Also aside from performance improvements, this would give a functional benefit of flow isolation, that you can segregate flows so that very latency sensitive flows could goto one disk and less sensitive can goto another (or other isolation reasons), so that at the disk level they can't impact one another. [~clebertsuconic] you note you had some initial work in this area, is this something you could share?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-839
18685	ARTEMIS-830	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/873 Can you just close it? I tried to close it myself and it didn't work.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-830
18686	ARTEMIS-824	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/867 @lulf build failure on this PR is accurate (apparently). Can you fix it? Try ``` mvn -Pdev install -DskipTests=true ``` on your local box.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-824
18687	ARTEMIS-824	Github user lulf commented on the issue: https://github.com/apache/activemq-artemis/pull/867 @clebertsuconic I'm not able to reproduce the issue. Both with and without skipTests=true works for me. From the jenkins test run it looks like it timed out, and I'm not able to find any test results. Is it possible to rerun the build?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-824
18688	ARTEMIS-822	Are you talking about the synchronized block in the write method of JournalImpl where the writes are enqueued?. If so, some sort of sync will probably always be needed to compute the correct offset for each record and checking for a rollover. But it's worth looking at to see if the time in the sync block could be reduced or rewritten in a way to reduce contention. As a reference, in the ActiveMQ 5.x broker, KahaDB does something very similar where records are enqueued and batched together under a lock and then a single thread writes the batches to the journal file.	0	0	https://issues.apache.org/jira/browse/ARTEMIS-822
18689	ARTEMIS-821	I thought that specifying relative delay instead of absolute time is a way to deal with the possibility of clock skew between clients and server. Another illusion shattered. :| This is yet another strange thing related to this. Section 7.9. of JMS 2.0 Spec: "Note however that the setDeliveryDelay method on Message cannot be used to set the delivery delay of a message." What?!? Why they even put the method there, then, if it does not do what it is supposed to do?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-821
18690	ARTEMIS-819	Github user johnament commented on a diff in the pull request: https://github.com/apache/activemq-artemis/pull/864#discussion_r84759299 --- Diff: pom.xml -- @@ -128,8 +128,8 @@ <project.build.sourceEncoding>UTF-8</project.build.sourceEncoding> <project.reporting.outputEncoding>UTF-8</project.reporting.outputEncoding> - <maven.compiler.source>1.7</maven.compiler.source> - <maven.compiler.target>1.7</maven.compiler.target> + <maven.compiler.source>1.8</maven.compiler.source> --- End diff -- Do we really want this in 1.5, or target for 1.6?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-819
18691	ARTEMIS-815	Github user jbertram commented on the issue: https://github.com/apache/activemq-artemis/pull/964 @dejanb, where are you on the test effort? Also, can you amend your commit message to follow the 50/72 format discussed in the [Hacking Guide](https://github.com/apache/activemq-artemis/blob/master/docs/hacking-guide/en/code.md#commitMessageDetails)?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-815
18692	ARTEMIS-802	Github user jbertram commented on the issue: https://github.com/apache/activemq-artemis/pull/850 Just for consistency's sake, can you remove the square brackets from around the JIRA? Back in the old days those were required for tracking commits, but they aren't needed with current tools. Also, can you add a simple test to ensure the new functionality is working as expected and that if it changes inadvertently in the future we'll catch it?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-802
18693	ARTEMIS-796	So, can I close these as won't fix, given we already have support for management?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-796
18694	ARTEMIS-796	We already have Management Notifications in Artemis. If you see any missing events, please add specific JIRAs for the ones you think we should add. You mentioned producers.. even though we don't have a Producer's server object.. some protocols will have internal Producers.. and when core-protocol is sent we could add some control on destinations... can you add a JIRA for that ?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-796

18696	ARTEMIS-793	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/839 There is one change that is wrong here. You are using the ProtocolTrackerCallback to admin DataSources. Can you separate this into a separate class? DataSourceTrackerCallback? And instead of returning a true or false, can you return the name of the datasources? Also: I coudln't comment on the change here given the merge mess you have on this branch now. Can you execute these commands please? ``` git pull --rebase upstream master git push origin -f your-branch-name ```	1	1	https://issues.apache.org/jira/browse/ARTEMIS-793
18697	ARTEMIS-793	Github user clebertsuconic commented on a diff in the pull request: https://github.com/apache/activemq-artemis/pull/839#discussion_r83920218 --- Diff: artemis-server-osgi/src/main/java/org/apache/activemq/artemis/osgi/ProtocolTrackerCallBack.java --- @@ -25,4 +25,6 @@ void addFactory(ProtocolManagerFactory<Interceptor> pmf); void removeFactory(ProtocolManagerFactory<Interceptor> pmf); + + void setDataSourceDependency(boolean dataSourceDependency); --- End diff -- what about renaming this to: addDataSource(WhateverInformationForTheDatasource); the callback could then decide what to do. the best would be to have a class extending ProtocolTrackerCallback: ServerTrackerCallback extends ProtocolTrackerCallback And at the caller we would check an instanceof. Would that be possible with OSGI? BTW: thanks for rebasing... at least I can comment on these changes now.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-793
18698	ARTEMIS-793	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/839 @graben I have merged, after I reverted some of the bad code I made you do. Can you check please? And sorry about that.. I really thought the ProtocolTracker was externally used.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-793
18699	ARTEMIS-790	Is this done?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-790
18700	ARTEMIS-786	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/835 looks nice... Let me run the whole testsuite before merging though.. I want also to run the examples. Have you done it? I'm a bit concerned with the examples as this will touch configurations.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-786
18701	ARTEMIS-786	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/835 @jbertram I will let you handle it then... please run the whole testsuite, including examples?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-786
18702	ARTEMIS-786	Github user gaohoward commented on the issue: https://github.com/apache/activemq-artemis/pull/835 @jbertram I move the hash factory api into the same PasswordMaskingUtil to reduce confusion, so that both 2-way encryption and one-way hashing APIs are in the same util class. But I'm not sure what's the benefit of bring in Jasypt. The PasswordMaskingUtil provides a general API which enables user to use customized password encoder/decoder like Jasypt, if he really want it. What do you think?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-786
18703	ARTEMIS-786	Github user jbertram commented on the issue: https://github.com/apache/activemq-artemis/pull/835 Is there a command to generate an encoded password so that you can put that into your configuration? I didn't see anything related to that.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-786
18704	ARTEMIS-786	Github user gaohoward commented on the issue: https://github.com/apache/activemq-artemis/pull/835 good idea. If you mean just doing the masking that could be done easily. If you mean also update the broker.xml with the command, I think it'll need some thinking and should be done in a separate JIRA. what do you think?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-786
18705	ARTEMIS-781	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/854 Ohhh... this is Artemis-781 branch. didn't realize that. should we be doing PRs on it? or just commit straight? I was doing straight committs when I was working with Howard on OpenWire.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-781

#	Requirement	Questions	Answered	Successfully Answered	URL
18706	ARTEMIS-780	[~martyntaylor] Would it make sense to put this out on confluence? Is there one for artemis, or perhaps a directory on the activemq one?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-780
18707	ARTEMIS-780	Items to consider: 0. Pre-configuring destinations is a big brain drain, so anything that can be client-driven is a win. Also, protocol specific handlers could perform the admin operations on-demand. For example: session.createDurableSubscriber(...) The JMS handler create the subscription on the behalf of the client. 1. Separate topic and queue namespaces.. in JMS topic:///foo != queue:///foo. The addressing will need some sort of way to separate the two during naming collisions. 2. In ActiveMQ 5.x, AMQP and STOMP handled the addressing by using queue:/// and topic:/// prefixes. I don't think that is necessarily a bad thing, but something to consider b/c we need to support #1 3. As far as destination behaviors, how about using uri parameters to pass provider (Artemis) specific settings on-the-fly? For example: in AMPQ the address could be topic:///foo?type=nonSharedNonDurable etc.. same for MQTT, STOMP, etc. There is precedence in using uri parameters to configure the Destination in JMS as well. IBM MQ has session.createQueue("My.Queue?targetClient=1") Note: AMQP supports options as well, so that could be used as well. However, uri's tend to be better for externalizing configuration management. 4. Destination name separation b/w protocol handlers. STOMP and MQTT like "/" and JMS likes "." as destination name separators. Is there any thought to having a native destination name separator and then have protocol-specific convertors? 5. Fully qualified destination names that include a broker name. Other providers support fully-qualified destination names in JMS following the format: queue://$brokerName/$queueName. Adding this would go a long way to supporting migration of current applications without having to change client-code. Note: This would probably impact cluster handling as well, so perhaps in phase 1 there is just a placeholder for supporting a broker name in the future?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-780
18708	ARTEMIS-762	Github user tabish121 commented on the issue: https://github.com/apache/activemq-artemis/pull/814 Was the commit of the log file intentional?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-762
18709	ARTEMIS-756	Once more...Is this done, [~johndament]?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-756
18710	ARTEMIS-756	[~johndament] how is this? Now that I know OSGi a bit better I'm not sure the example makes sense.. Maybe docs, sure... you know OSGi better than I do.. so what you think about this?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-756
18711	ARTEMIS-756	Github user johnament commented on the issue: https://github.com/apache/activemq-artemis/pull/857 So there's a couple of things I don't like right now - need some input from you guys. - The artemis maven plugin seems to need to redeclare dependencies. Is there a way to do this in a profile? - Do I need a `broker.xml` or can that be inherited somehow?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-756
18712	ARTEMIS-756	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/857 That is the finalize closing the connection that was left open. Is that a issue? do you have anything to be called when the osgi is going down and close the connection?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-756

18715	ARTEMIS-743	Github user clebertsuconic commented on a diff in the pull request: https://github.com/apache/activemq-artemis/pull/787#discussion_r79860213 --- Diff: artemis-server/src/main/java/org/apache/activemq/artemis/core/server/impl/ActiveMQServerImpl.java --- @@ -1290,10 +1291,7 @@ protected ServerSessionImpl internalCreateSession(String name, SessionCallback callback, OperationContext context, boolean autoCreateJMSQueues) throws Exception { - return new ServerSessionImpl(name, username, password, validatedUser, minLargeMessageSize, autoCommitSends, autoCommitAcks, preAcknowledge, configuration.isPersistDeliveryCountBeforeDelivery(), - xa, connection, storageManager, postOffice, resourceManager, securityStore, managementService, this, configuration.getManagementAddress(), - defaultAddress == null ? null : new SimpleString(defaultAddress), callback, context, autoCreateJMSQueues ? jmsQueueCreator : null, - pagingManager); + return new ServerSessionImpl(name, username, password, validatedUser, minLargeMessageSize, autoCommitSends, autoCommitAcks, preAcknowledge, configuration.isPersistDeliveryCountBeforeDelivery(), xa, connection, storageManager, postOffice, resourceManager, securityStore, managementService, this, configuration.getManagementAddress(), defaultAddress == null ? null : new SimpleString(defaultAddress), callback, context, autoCreateJMSQueues ? jmsQueueCreator : null, pagingManager); --- End diff -- this line gets too big.. can you break it?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-743
18716	ARTEMIS-737	Github user jbertram commented on the issue: https://github.com/apache/activemq-artemis/pull/789 I think it would also be good to have a clear explanation of why this approach is superior to the approach already adopted in the test-suite. Additional questions: 1. What expectation is there to adopt this style of testing? Should all new tests use this style? 2. Do you plan on converting all existing test-cases to this style? If not, I'd be concerned with having 2 methods of doing the same thing introducing confusion.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-737
18717	ARTEMIS-737	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/789 I guess this is intended for users to use on their tests? What was the intention, to refactor Artemis' testsuite, or to provide rules for users running their own tests?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-737
18718	ARTEMIS-737	Github user hqstevenson commented on the issue: https://github.com/apache/activemq-artemis/pull/789 I'd be happy to add an example, but I'm not sure exactly what you're looking for. All of the unit tests show the basics of how you embed a sever into your test, and how you use the server afterwards. Is there a specific type of test you'd like to see? BTW - once this is released, I'm going to contribute a "example-camel-artemis" to the Camel project - that will show how to use the embedded resources with Camel.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-737
18719	ARTEMIS-737	@clebertsuconic -I had an idea - I noticed that none of the examples have a "unit test". I know you can run them with some the maven infrastructure that is available in the examples, but I thought it would be nice to have a unit test for an individual example. So I updated the "Bridge" example (examples/features/standard/bridge) and added a unit test using the EmbeddedJMSResource - can you give it a look? Note that I had to change the broker.xml files to get rid of a security exception I was seeing with the test - not really sure what's going on there. But if you like the idea, I could update a few more of the examples to include this type of unit test.	1	0	https://issues.apache.org/jira/browse/ARTEMIS-737
18720	ARTEMIS-717	Can you quantify the "high burden" that the broker is under with a large number of groups? I'm mainly thinking of hot spots in the code where a lot of time is spent (e.g. stuff you might find by attaching a profiler), but an application-level quantification would be fine as well.	0	0	https://issues.apache.org/jira/browse/ARTEMIS-717
18721	ARTEMIS-717	How long do you plan to use a particular group? For example, if you start the year with a group named 'X' do you expect to end the year with that same group 'X' or will 'X' not be used after a certain point? I assume that when you say "doesn't expire mappings" you mean that any group ever created will need to exist in perpetuity. Also, how often will a group be used on average in your use-case?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-717
18722	ARTEMIS-714	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/771 @jmesnil there was some changes I made to JDBC that are conflicting with this. Do you mine looking at them? Also.. this is showing 3 commits.. shouldn't you squash them and push -f to your branch?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-714

18724	ARTEMIS-679	I meant.. you wouldn't be able to start a server without a replica.	0	0	https://issues.apache.org/jira/browse/ARTEMIS-679
18725	ARTEMIS-670	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/705 I think this gets a bit confused for users... Why don't you add the following commands: create-queue create-topic delete-queue delete-topic You can have abstract classes for what is common among the classes. It will be the same implementation almost, but the user would have more control on what he wants to be done. The way this is structure, you are using a create-queue command to delete it. I don't think it's too intuitive to the user.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-670
18726	ARTEMIS-670	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/705 @gaohoward when I wrote the delete-topic up here was just as an example of separating the commands. I didn't mean to be literal. Do you actually need to differenticate delete-topic from delete-queue or it could just be delete?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-670
18727	ARTEMIS-659	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/694 @johnament tests are good here. can we merge this? or you have other plans to this dependency on your next work on CDI?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-659
18728	ARTEMIS-658	Can you elaborate on the use-case here a bit? Perhaps it should be obvious, but it isn't obvious to me.	1	0	https://issues.apache.org/jira/browse/ARTEMIS-658
18729	ARTEMIS-658	The only thing I see at that link is a few notes about logistics. There's nothing about the general use-case. Am I missing something?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-658
18730	ARTEMIS-656	I believe it's true that Artemis doesn't currently do hostname verification for SSL/TLS connections, and I aim to correct that. However, I'm a bit confused by the description. It says, "Artemis doesn't configure a trust manager when connecting bridges..." As I understand it, bridge connections are treated just like any other client connection which connects to a Netty acceptor and a trust manager will be created for that acceptor assuming the it was configured with a valid trustStorePath and trustStorePassword. The same is true for the Netty connector which the bridge uses. Is this what you're talking about? In any case, I'm not clear on how the trust manager relates to hostname verification. Also, I don't understand the phrase, "...there's no attempt to verify that the hostname of the target broker matches the one that triggered the connection." Unless I'm thinking about this wrong, the name of the host that triggers the connection will always be different from the name of host of the target broker unless the two are actually running on the same host (which would be unusual). Therefore, they shouldn't match. Right?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-656

18739	ARTEMIS-627	[~gemmellr] Sure, thanks Robbie. I can certainly see how the current behaviour is a good middle ground between performance and protecting the broker. I just wanted to make sure we don't just shut this down and ignore it because it can hurt performance. I did some testing and it's quite easily to exhaust the brokers memory with a single dodgy client. I'll get the doc updated and we can address this as a feature request later down the line. I'm in the process of adding BLOCK for AMQP, we could easily add reject to the BLOCK policy. Using amqp:resource-limit-exceeded, I guess it's a little more important with AMQP since the flow control credits represent number of messages (vs number of bytes as in CORE) so it could be possible to go way over the limit quite quickly. Do you have any thoughts on what would be best in teh AMQP scneario? Thanks	1	1	https://issues.apache.org/jira/browse/ARTEMIS-627

18741	ARTEMIS-605	Can you elaborate on the use-case here a bit? If you want to prevent users from sending rogue management messages you can simply not grant them the {{manage}} permission.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-605

#	Requirement	Questions	Answered	Successfully Answered	URL
18742	ARTEMIS-601	The current implementation idea for ARTEMIS-66 is to write changes made via the management API back to the XML so the broker.xml would still be the master and changes would survive restarts. Your runtime configuration wouldn't be different from the configuration file. I assume all your management tools are all going to need to change to support Artemis' new XML format anyway. Could they not change to execute a simple shell/perl/python script. I'm not terribly familiar with Puppet. Is it only able to modify text files? If it's built for managing deployments and runtime configuration I'd be surprised if it didn't support JMX since that is the standard for managing Java applications.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-601
18743	ARTEMIS-601	Justin, this is the first time I read about "Artemis' new XML format". Is this documented/discussed somewhere? Of course, management tools could be extended with scripts talking JMX that try to find the differences between the expected configuration and the existing configuration and fire up the the right API calls. This however would move the complexity from one place (the broker) to multiple places (all the various management tools used in the wild). Instead of having one single implementation, evolving along with the broker, we would have different implementations, each with their own set of bugs, that all need to be kept in sync with changes in the broker. ActiveMQ's approach (periodically reload the configuration file) is far superior and goes beyond only security settings. It would be a pity to lease this feature in Artemis.	0	0	https://issues.apache.org/jira/browse/ARTEMIS-601
18744	ARTEMIS-600	It's not clear to me what from the list of "Drawbacks in current design" are actually consequences of the design or just bugs in the implementation (e.g. #4 and #5 in that list sound like bugs to me, and #3 sounds like a misconfiguration). IMO, most clustered message grouping use cases don't make a lot of sense in the first place. Clustering is a way to increase performance by distributing load across multiple brokers. However, message grouping necessarily decreases performance since message consumption must be serialized. If consumption throughput is low (due to message grouping serialization) then it's likely users will want to impose flow control on producers to avoid paging unconsumed messages to disk thereby reducing producer throughput. The need for a cluster in this scenario is dubious, but I digress. [~ryeats], I'm not sure what you mean by "fully supported." Can you elaborate on that? The currently message grouping implementation is working for a fair number of users. I would expect any bugs to be fixed.	1	0	https://issues.apache.org/jira/browse/ARTEMIS-600
18745	ARTEMIS-600	[~ryeats], at this point I can't confirm anything as the JIRA description contains no real information about what exactly is failing and in what use-cases the failures occur. IMO, this would have been better as a thread on the mailing list rather than a JIRA. [~mnovak], can you open individual JIRAs for drawbacks 3, 4, and 5 and explain the relevant use-case, what specifically isn't working, etc. Reproducers are always welcome.	1	0	https://issues.apache.org/jira/browse/ARTEMIS-600
18746	ARTEMIS-592	Martyn, here is a description of our use case. All our clients use STOMP. We have a producer sending messages to a single topic, for instance {{jms.topic.foo}}. We have two different clients (let's call them {{A}} and {{B}}) who both want to receive all these messages. No problemo, each client creates its own durable subscription on the topic and this materializes as two different queues inside Artemis. However, we want to separate these clients and make sure one client cannot read the messages in the other client's queue. How can this be expressed as a {{<security-setting>}} element? We succesfully use ActiveMQ 5.x for this setup. We use http://activemq.apache.org/virtual-destinations.html and we assign different security settings to the different queues attached to the same topic ({{/topic/foo}}), for instance {{/queue/Consumer.A.VirtualTopic.foo}} and {{/queue/Consumer.B.VirtualTopic.foo}}.	1	0	https://issues.apache.org/jira/browse/ARTEMIS-592
18747	ARTEMIS-592	Thanks for the explanation Lionel. I think I understand the problem, but just to ensure we're on the same page, let me iterate back what I think the problem is. There are two STOMP clients, A and B, which both subscribe to add jms.topic.foo. Which looks something like: {code} / ----------> [Ma,Ma,Ma] (Sub Q Client A) JMS Producer ----------> jms.topic.foo / \ \ ----------> [Mb,Mb,Mb] (sub Q Client B) {code} The thing you are trying to prevent, is client A setting up a subscription to jms.topic.foo and potentially consuming client B messages? I've looked into the STOMP code and I believe there is a bug that causes this problem. Subscriptions queues are not properly created, meaning two subscriptions to the same address could receive each others messages. Is this what you are seeing? If so would fixing the bug resolve this issue?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-592
18748	ARTEMIS-592	The only scenario is which a test client could interfere with the production flow in the way you describe is if the production client disconnects, the test client subsequently connects, is then authenticated, then pretends to be the production client by passing in the production client id. Is this the scenario you are trying to avoid? ActiveMQ Artemis does have a very different internal model of addressing, queues and routing and there may well be cases in which ActiveMQ 5.x needed locking down that doesn't really apply to Artemis. If you are on IRC I could go over the model with you, it might be useful to know regardless? #apache-activemq	1	0	https://issues.apache.org/jira/browse/ARTEMIS-592
18749	ARTEMIS-592	Github user mtaylor commented on the issue: https://github.com/apache/activemq-artemis/pull/701 @jbertram I'm not sure about using the queue name to control access. It requires users to understand how subscriptions work internally and how the queue name is constructed, which might be different across protocols. Perhaps a neater approach could be to allow all users of a particular role to share subscriptions, controlled by an address setting. e.g. User defines a role "production", all users within this role are able to share subscriptions between themselves. Many roles could be created that are able to share subscriptions, "production", "test", "application-x", only users within the role are able to share the subscription. Production Role: user1, user2 Test Role: user3, user4 user1 and user2 can share the subscription, user3 and user4 can also share a subscription, user1 and user3 can not share a subscription. We could also create a new security-setting to limit which roles are able to share subsctipions and for which addresses, something like "sharedSubscriptionGroup" (or better name), which specifies which roles are allowed to share subscriptions. e.g. ```xml <security-setting match="jms.topic.news.us.#"> <permission type="createDurableQueue" roles="user"/> <permission type="send" roles="us-user"/> <permission type="shareSubscription" roles="production,test"/> </security-setting> ``` We already store which user created the queue "the queue owner", we could use this information to determine whether or not to allow another user to share this subscription. You can get the queue owner roles and the current user roles to make the comparison and do a check on the security setting. Does this make sense? Any thoughts?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-592
18750	ARTEMIS-592	Github user mtaylor commented on the issue: https://github.com/apache/activemq-artemis/pull/701 @clebertsuconic sure, I think that similar feature is virtual topics, which solve the same problem as shared subscriptions. The way it works in ActiveMQ 5.x is that the user specifies the virtual topic queue to allow the shared subscription. This JIRA is with respect to virtual topics, so the first thing we need to do is actually an equivilent (shared subscription) support. That's when this JIRA starts to become a problem. Once we allow users to share subscriptions, how can we control access to the shared subscription. Queues are just an implementation detail.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-592

#	Requirement	Questions	Answered	Successfully Answered	URL
18751	ARTEMIS-592	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/701 I am not sure <permission type="shareSubscription" roles="production,test"/> would really be that user friendly as you defined. it could be confusing actually. you already have permissions to createQueue, createDurableQueue and consume. shareSubscriptions is exactly that... and it makes confusing to add an extra setting here. Artemis is a multi-protocol broker.. we are making other protocols more mature and your definitions of shareSubscription there may not fit all the protocols.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-592
18752	ARTEMIS-592	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/701 There is one concept on core called createSharedQueue, which is a temporary queue that will exist as long as there is an user connect into it. shared=true might confuse with that approach, unless this operation was specifically in regard to this type of shared queue. is that the case?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-592
18753	ARTEMIS-592	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/701 @jbertram any one... is this about Temporary Shared Queues? or anything in particular. if this is just about shared temp queues, then Martyn's suggestion could make sense.. if not.. it makes it even more confusing.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-592
18754	ARTEMIS-592	IMHO, it is very important to define precisely how Artemis handles durable STOMP subscriptions. Since they are durable, they are related to some kind of queues somewhere. Can we send messages directly to these queues? With Apollo and ActiveMQ 5.x, we can. Do we allow multiple connections to the same queue (see @clebertsuconic question "Wouldn't be easier if we just failed more than one connection with the same client-id?")? With Apollo and ActiveMQ 5.x, we can and messages will be split between all consumers, like with regular queues. Can we define different security settings (this is the initial scope of this Jira issue)? With Apollo and ActiveMQ 5.x, we can. Since Artemis supports multiple protocols, the next question is how much of this is (mostly) protocol independent and ends up in the Core and how much is protocol specific. From a user point of view, the more gets protocol independent, the better. I would prefer to have the same security settings regarding which protocols the clients end up using. Justin's proposal to concatenate the address and queue names looks fine to me.	0	0	https://issues.apache.org/jira/browse/ARTEMIS-592
18755	ARTEMIS-592	"Can we send messages directly to these queues? With Apollo and ActiveMQ 5.x, we can." In STOMP this is possible. But not just any client has access to the queue. The STOMP implementation will prepend durable subscriptions with the client-id. So subscribing to "foo" with client-id "123" allows you to consume from the queue "123.foo". This is how the STOMP implementation behaves. "Do we allow multiple connections to the same queue (see @clebertsuconic question "Wouldn't be easier if we just failed more than one connection with the same client-id?")? With Apollo and ActiveMQ 5.x, we can and messages will be split between all consumers, like with regular queues." We do. Similar to how we handle durable subscriptions (explained above). It's possible to have more than 1 STOMP client with the same ID connect to the broker. Thus, all clients with ID 123 are able to subscribe to "123.foo". This has some limitations, a client with ID 123, is not able to "share a durable subscription queue" with client ID 456. This behaviour of sharing queues based on the client-id field isn't supported across all protocols. In order to do this we may have to break the spec of some protocols (which may or may not be acceptable) MQTT is an example of where this is explicitly outlined in the spec as not supported. TBH I'm not sure if the shared durable subscription ability (through client-id) was intentional or was a side effect of the implementation. "Can we define different security settings (this is the initial scope of this Jira issue)? With Apollo and ActiveMQ 5.x, we can." Yes this fix allows you to do that with STOMP. "Since Artemis supports multiple protocols, the next question is how much of this is (mostly) protocol independent and ends up in the Core and how much is protocol specific." Justin's point, which I think is a good one. Is that by securing queues, it's possible to apply it across protocols. The slight concern I had was that protocol implementations use queues to expose the desired protocol features. Using security settings at the queue level, requires exposing the underlying implementation details of each protocol. I'm now feeling OK with this if we can somehow standardise the internal naming schemes across all protocols. I believe STOMP durable subscriptions are <client-d>.<subscription-id>, MQTT is similar <client-id>.<subscription-address>. "From a user point of view, the more gets protocol independent, the better. I would prefer to have the same security settings regarding which protocols the clients end up using. Justin's proposal to concatenate the address and queue names looks fine to me." Yes, to make this non protocol specific we could perhaps support something similar to virtual destinations or standardise on the naming scheme.	1	0	https://issues.apache.org/jira/browse/ARTEMIS-592
18756	ARTEMIS-592	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/750 Are you sure about ARTEMIS-592? ARTEMIS-592 is about fine grain access control.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-592
18757	ARTEMIS-590	I think this idea has merit. However, I'd like to keep the system properties to a minimum as they shouldn't be the normal way a connector is configured. The SSL related system properties only exist because that's the way Java has historically configured keystore-related details. The ideal way to configure this is with a transport constant so you could use something like {{tcp://127.0.0.1:61616?sslEnabled=true;useDefaultSSLContext=true}}. If this approach is taken then the question arises as to which settings take precedence since this new constant and the existing keystore-related constants as well as the system properties are mutually exclusive. Can you clarify how you envision this working?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-590

#	Requirement	Questions	Answered	Successfully Answered	URL
18760	ARTEMIS-584	Github user mikehearn commented on the issue: https://github.com/apache/activemq-artemis/pull/621 Is there a reason this is disabled by default? Performance, maybe? It seems pretty useful, it's just odd that it's off by default. It makes me wonder what the catch is.	0	0	https://issues.apache.org/jira/browse/ARTEMIS-584
18761	ARTEMIS-582	Couple of questions: * The cited MCollective documentation indicates that orphaned single-use queues will "clog up ActiveMQ's available memory." Can you confirm that the behavior here in Artemis is similar to that of ActiveMQ 5.x? In other words, do orphaned single-use queues clog up Artemis' available memory? If so, can you quantify the clogging (e.g. X number of orphaned single-use queues in Y bytes of heap causes high GC or OOME)? * Artemis supports the automatic deletion of JMS queues (see [the docs|http://activemq.apache.org/artemis/docs/1.3.0/queue-attributes.html] for more details on that). Can MCollective be configured to use JMS queues rather than core queues for the single-use queues that it needs?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-582
18762	ARTEMIS-582	Not knowing the internals of Artemis, I have no idea how much unused destinations cost in terms of memory. MCollective is just one example of an application using temporary destinations, the rate of creation of unused destinations will vary a lot with the application. "Can MCollective be configured to use JMS queues rather than core queues for the single-use queues that it needs?" Currently, no. MCollective comes with two connectors: ActiveMQ and RabbitMQ (see https://github.com/puppetlabs/marionette-collective/tree/master/lib/mcollective/connector). Since Artemis is not backward compatible with ActiveMQ 5.x, a third connector would need to be written for Artemis. Finally, it is not clear to me how automatic deletion of topics and queues work in Artemis. When would they be deleted? Immediately or after an "inactivity timeout"? In my STOMP tests, both Core and JMS addresses and queues have been created and some of these (did not check which ones) stayed after several hours and several broker restarts, triggering warnings such as: {code} 2016-06-20 13:20:03,107 [org.apache.activemq.artemis.core.server] WARN AMQ222205: OutOfMemoryError possible! There are currently 400 addresses with a total max-size-bytes of 4,194,304,000 bytes, but the maximum memory available is 764,411,904 bytes. {code}	1	0	https://issues.apache.org/jira/browse/ARTEMIS-582
18763	ARTEMIS-582	Couple of things... * There's no need to know any internals of Artemis or ActiveMQ for simple comparative analysis. All that's necessary is a standardized test used for both brokers and a way to measure the results which could be as simple as watching the memory graph in VisualVM or JConsole. * Artemis implements OpenWire so it should (theoretically) be backward compatible. Although looking more closely at MCollective it appears it's using STOMP which will almost certainly suffer some incompatibilities between brokers. * The documentation I cited previously describes when an auto-create queue or topic will be deleted. * Can you provide a simple test to reproduce what you're seeing? I wrote a quick test in the Artemis test-suite to ensure that auto-created queues are deleted as expected and it passed without issue.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-582
18764	ARTEMIS-582	I'm having troubles isolating the part that triggers this problem. Is there some debugging that I could enable on the broker side to provide useful insight on what's going on there?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-582
18765	ARTEMIS-581	Makes sense... Although I would always fail when that disk limit is hit. It would make understanding and configuration easier for users. Controlling what to do in case of a disk full, would give users too many options and would complicate user's decision. Would anyone be contrary to always fail the Send or Transaction in case the configured disk limit is hit?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-581

18773	ARTEMIS-550	Github user mattrpav commented on the issue: https://github.com/apache/activemq-artemis/pull/875 Has there been mention of the transactedSend and concurrentSend options? These are super useful for improving reliability and scalability when using Virtual Topics.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-550
18774	ARTEMIS-550	Artemis has another concept known as "diverts." With diverts, you can effectively subscribe a durable queue to a topic, so that the queue receives all messages that were sent to the topic and holds them until its consumer is online. My understanding is that, in practice, this provides the same functionality as (and possibly more flexibility than) virtual topics. Could your use case be covered by diverts instead? https://activemq.apache.org/artemis/docs/1.4.0/diverts.html	0	0	https://issues.apache.org/jira/browse/ARTEMIS-550
18775	ARTEMIS-550	Github user mattrpav commented on the issue: https://github.com/apache/activemq-artemis/pull/875 @graben re: Transacted: if the PostOffice is transacted by default, that's great. The option in 5.x felt more like a "shore-up" to get to transacted. I don't see a compelling reason to support non-transacted broker-side message movement. A note in the migration guide would suffice. re: Concurrency: I see this having value, and agree it should be a separate JIRA/PR. re: Selector/Filter: that's great that you have it on your radar. You mentioned filter, so I feel obligated to clarify-- this selector is determined by the _consumer_ using the standard JMS selector available in the API. The broker then store these to properly filter messages if the consumer goes offline. Does Artemis' filter support this behavior, or is filtering broker-side configuration? Thanks!	0	0	https://issues.apache.org/jira/browse/ARTEMIS-550
18776	ARTEMIS-550	Github user andytaylor commented on the issue: https://github.com/apache/activemq-artemis/pull/875 @graben Could you explain why virtual topics need to be added. As far as I was aware in ActiveMQ its just to provide shared consumers and queue like semantics on a topic which Artemis does by default?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-550
18777	ARTEMIS-550	Github user rlodge commented on the issue: https://github.com/apache/activemq-artemis/pull/875 @andytaylor How does Artemis provide the same functionality by default (without configuration for each "virtual topic / queue" being added to the broker's configuration)? This is one of the only (maybe the only) feature keeping us from attempting to migrate to Artemis from ActiveMQ. I've looked through the documentation and haven't been able to find a similar feature other than diverts, which seem to need broker configuration and broker restart, which would be a dealbreaker, since our environment requires clients to to be able to dynamically create the queue (not just queue-like) destinations on the fly without broker reconfiguration or restart.	0	0	https://issues.apache.org/jira/browse/ARTEMIS-550

#	Requirement	Questions	Answered	Successfully Answered	URL
18778	ARTEMIS-550	Github user clebertsuconic commented on the issue: https://github.com/apache/activemq-artemis/pull/875 @rlodge you can have as many consumers you like on a QueueSubscription with Artemis. You can limite the client-id if you like, but you can also bypass that. The only use case I can see for artemis with Virtual topics is migration case... users migrating to artemis without changing code.. but I want to make sure I understand the requirements. What is needed? Route the virtual queue to another existing core queue? if that's the case it's pretty simple implementation. (I guess you would have most of what is needed on this PR)?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-550
18779	ARTEMIS-550	Github user andytaylor commented on the issue: https://github.com/apache/activemq-artemis/pull/875 @rlodge so I think all that is doable without having to add the notion of a virtual topic. With the addressing changes this should be even easier to add to the Openwire protocol manager. one thing you could explain is does "we want to be able to broadcast a message to an unknown number of different subscribers" mean to different addresses or just one address like myTopic?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-550
18780	ARTEMIS-550	Github user rlodge commented on the issue: https://github.com/apache/activemq-artemis/pull/875 @mtaylor What I'm hearing is that basically, following changes in 780, a client would be able to send to an address "RecordUpdateNotifications", other clients could subscribe to "RecordUpdateNotifications::SystemARecordUpdateNotifications" and it would act essentially like virtual topics do now; all "RecordUpdateNotifications::*" subscriptions would read from queues coming from the single address? If so, do OpenWire clients need to use a specific queue / address naming scheme, or would it happen automatically somehow (and could it be mapped from the VirtualTopic.* naming scheme)? It's not a terribly large problem for us to go through and change our queues from VirtualTopic.* to a slightly different naming scheme, though we'd rather change nothing about the clients; it would be more difficult to somehow change the API's we were calling...	0	0	https://issues.apache.org/jira/browse/ARTEMIS-550
18781	ARTEMIS-550	Github user andytaylor commented on the issue: https://github.com/apache/activemq-artemis/pull/875 @graben It sounds different, what is it a pool of, connections?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-550
18782	ARTEMIS-550	[~graben] Are you saying that it is not possible to implement these things using the new address model? I agree that the existing naming conventions i.e. using "::" is different to ActiveMQ 5.x, and there are gaps wrt how things are configured. For example using prefixing. The JIRA I added above is intended to track gap in the naming schema, like for example using prefixes instead of FQQN. What I don't want to do, is just clone the way ActiveMQ 5.x does virtual topics, as it doesn't fit in well with the Artemis architecture. Instead, I plan on providing generic solutions for things like address aliasing that solve part of the problem, whilst being an overall useful feature for other use cases.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-550
18783	ARTEMIS-548	Github user jbertram commented on the issue: https://github.com/apache/activemq-artemis/pull/653 There's a handful of Stomp subscriber tests running without issues. Can you clarify a bit on what is broken. If you can outline a specific use-case then I can write a test for it.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-548
18784	ARTEMIS-529	Is there any chance you'd be willing to send a PR for this?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-529
18785	ARTEMIS-529	Is there any chance you'd be willing to learn more about Artemis' internals in order to send a PR for this?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-529
18786	ARTEMIS-529	[~jbertram] Hi Justin, do you know where we are with this issue? I was of the understanding that all ActiveMQ 5.x JAAS modules were available in Artemis? If not are there any other outstanding?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-529
18787	ARTEMIS-517	Are you wanting to be able to execute this on the backup server or on the live server or both? {{org.apache.activemq.artemis.core.server.impl.SharedNothingBackupActivation#isRemoteBackupUpToDate}} already exists for the backup. Of course, the traditional management mechanisms won't be available until the backup actually becomes live. For the live server, {{org.apache.activemq.artemis.core.server.impl.Activation#getReplicationManager}} exists already which (if not null) can be used to invoke {{org.apache.activemq.artemis.core.replication.ReplicationManager#isSynchronizing()}}. If that returns {{false}} then you know the live and backup have synced up.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-517
18788	ARTEMIS-517	SharedNothingBackupActivation & Activation are in impl packages and are not considered public API. Besides I find that clunky to have to look at 3 different objects to get this information. Could this be exposed by a single method on the ActiveMQServer interface instead?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-517
18789	ARTEMIS-517	Github user clebertsuconic commented on a diff in the pull request: https://github.com/apache/activemq-artemis/pull/513#discussion_r62853199 --- Diff: artemis-server/src/main/java/org/apache/activemq/artemis/core/server/impl/ActiveMQServerImpl.java --- @@ -674,6 +674,26 @@ public void setJMSQueueDeleter(QueueDeleter jmsQueueDeleter) { this.jmsQueueDeleter = jmsQueueDeleter; } + @Override + public boolean isInitialReplicationSynchronizationComplete() { --- End diff -- suggestion: wouldn't isReplicaSync be a better name?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-517
18790	ARTEMIS-508	Checked! I'm not sure i prefer the vanilla's single Thread Executor as first-class choice to reduce the contention/need of synchronization of the journal; for few reasons: 1) it use internally a LinkedBlockingQueue: - it does not support in the right way batch offering due to the lock on the submit of new elements on it, implying a sort "OS queue effect" that lead to impredicible latencies, thus it will make even less predictable what is trying to cure - it creates new nodes without recycling in any way,this could lead to a lot a bad effects on latencies and on the overall application behaviour due to the pressure on the garbage collector (eg Full GC pauses + http://psy-lob-saw.blogspot.it/2016/03/gc-nepotism-and-linked-queues.html) - the on-heap Java objects it uses are sensible to Card Marking issues and pointer chasing issues (less cache friendly!) 2) creates a lot of garbage submitting new Runnable for each write request (+ new Future<T>,FutureTask etcetera) 3) it doesn't order properly the write requests (cannot be made fair on the requests scheduling without pain) Thus i see only two opportunities of improvements: 1) single threaded (like my current implementation): reduce features but make it fast as hell (single writer principle is ever a good idea IMHO and less branches let it more predictable and faster) 2) multi-threaded: using an approach similar to this https://groups.google.com/forum/#!topic/mechanical-sympathy/5jMIVNf7zXA or with the single threaded version plus a lock-free ringBuffer that feed an event loop (that could use the single-threaded version of the SequenceFile) What do you think about it?Do you see other possibilities?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-508
18791	ARTEMIS-508	I'm not sure To be honest... The synchronization we have as I remember is just to enqueue on the writes on the Sequential Files.. Look at the TimedBuffer... A lot of these are just waiting the callback through the operation context, it's based on notifications. But I'm definitely open for improvements. Why don't we start with including your MappedSquentialFile in the codebae and then look for possibilities for improvements? We could even do a google hangout or any sort of video meeting to look over where to make improvements. We could maybe do that after mid next week?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-508

18792	ARTEMIS-508	I'm very happy if the mapped journal could became part of the codebase!!! Perfect with Hangout! Do you have any preference about day and/or time of day? In this way i could ask you directly details to understand better the context or the assumpions of the usage of the Journal....	1	1	https://issues.apache.org/jira/browse/ARTEMIS-508
18793	ARTEMIS-487	Can you explain more.... Do I have to write a new method or new class...	1	0	https://issues.apache.org/jira/browse/ARTEMIS-487
18794	ARTEMIS-473	I've created new jira for the description - ARTEMIS-679 - Activate most up to date server from master-slave(live-backup) pair. If split brain happens then there is not much Artemis can do about it. Still it can recover from quite common cases. Basically 3 situation can happen when split brain happens (=master and slave are active at the same time): a) Clients do not loose connection to master and stay connected to master. b) Clients loose connection to master and failover to backup. c) Clients loose connection to master and slave at same time. They're trying to reconnect to master-slave pair. I believe that for situations a) and b) Artemis can recover when network is reconnected. In the moment when master and slave notice that they're active at the same time, they will check who has external (no in-vm) connections. Server without external client connections will restart. Only server with the clients has the up-to-date journal. Option c) is problematic as clients can connect to master or slave so in this case there is nothing Artemis can do. wdyt?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-473
18795	ARTEMIS-444	Github user andytaylor commented on the pull request: https://github.com/apache/activemq-artemis/pull/425#issuecomment-199269101 Can you improve this so the log message makes sense and to actually use the method. so something like 'LIBAIO is installed but /path/somewhere does not support AIO'.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-444
18796	ARTEMIS-444	Github user clebertsuconic commented on a diff in the pull request: https://github.com/apache/activemq-artemis/pull/425#discussion_r56841836 --- Diff: artemis-journal/src/main/java/org/apache/activemq/artemis/core/io/aio/AIOSequentialFileFactory.java --- @@ -114,6 +116,36 @@ public static boolean isSupported() { return LibaioContext.isLoaded(); } + public static boolean isSupported(File journalPath) { + if (!isSupported()) { + return false; + } + + File aioTestFile = new File(journalPath, AIO_TEST_FILE); + try { + int fd = LibaioContext.open(aioTestFile.getAbsolutePath(), true); + LibaioContext.close(fd); + aioTestFile.delete(); + } catch (Exception e) { + // try to handle the file using plain Java + // return false if and only if we can create/remove the file using + // plain Java but not using AIO + try { + if (!aioTestFile.exists()) { + if (!aioTestFile.createNewFile()) return true; --- End diff -- Isn't that a bit convoluted?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-444
18797	ARTEMIS-439	Can this be resolved? It appears to be done.	0	0	https://issues.apache.org/jira/browse/ARTEMIS-439
18798	ARTEMIS-418	Based on my perusal of the ActiveMQ 5.x code it looks like MinMessageSize, AverageMessageSize, and MaxMessageSize are based on all the messages that have been sent to the queue rather than the messages that are currently in the queue. Is that correct? I couldn't find any documentation specifically explaining these metrics.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-418
18799	ARTEMIS-418	[~jbertram] This is resolved as incomplete? Is it partially fixed?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-418
18800	ARTEMIS-413	I'm not terribly familiar with the STOMP implementation, but I see several tests in {{org.apache.activemq.artemis.tests.integration.stomp.StompTest}} related to durable topic subscriptions (e.g. {{testDurableSubscriberWithReconnection()}}) which suggests it is supported. Can you give that a look?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-413
18801	ARTEMIS-409	What does the body of the response say in this situation?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-409
18802	ARTEMIS-405	Also, some attributes are documented as {{N/A}}. For instance we have in the Core: {code} org.apache.activemq.artemis:address=*,brokerName=*,module=Core,name=*,serviceType=Queue,type=Broker: ========== Attributes: Address java.lang.String [ro], "address this queue is bound to" ConsumerCount int [ro], "number of consumers consuming messages from this queue" DeadLetterAddress java.lang.String [ro], "dead-letter address associated with this queue" DeliveringCount int [ro], "number of messages that this queue is currently delivering to its consumers" Durable boolean [ro], "whether this queue is durable" ExpiryAddress java.lang.String [ro], "expiry address associated with this queue" Filter java.lang.String [ro], "filter associated with this queue" FirstMessageAge java.lang.Long [ro], "age of the first message in milliseconds" FirstMessageAsJSON java.lang.String [ro], "first message on the queue as JSON" FirstMessageTimestamp java.lang.Long [ro], "timestamp of the first message in milliseconds" ID long [ro], "ID of this queue" MessageCount long [ro], "number of messages currently in this queue (includes scheduled, paged, and in-delivery messages)" MessagesAcknowledged long [ro], "number of messages acknowledged from this queue since it was created" MessagesAdded long [ro], "number of messages added to this queue since it was created" Name java.lang.String [ro], "name of this queue" Paused boolean [ro], "whether the queue is paused" ScheduledCount long [ro], "number of scheduled messages in this queue" Temporary boolean [ro], "whether this queue is temporary" {code} But in JMS: {code} org.apache.activemq.artemis:brokerName=*,module=JMS,name=*,serviceType=Queue,type=Broker: ========== Attributes: Address java.lang.String [ro], "N/A" ConsumerCount int [ro], "number of consumers consuming messages from this queue" DeadLetterAddress java.lang.String [ro], "dead-letter address associated with this queue" DeliveringCount int [ro], "N/A" ExpiryAddress java.lang.String [ro], "expiry address associated with this queue" FirstMessageAge java.lang.Long [ro], "age of the first message in milliseconds" FirstMessageAsJSON java.lang.String [ro], "first message on the queue as JSON" FirstMessageTimestamp java.lang.Long [ro], "timestamp of the first message in milliseconds" MessageCount long [ro], "N/A" MessagesAdded long [ro], "N/A" Name java.lang.String [ro], "N/A" Paused boolean [ro], "N/A" RegistryBindings [Ljava.lang.String; [ro], "N/A" ScheduledCount long [ro], "number of scheduled messages in this queue" Selector java.lang.String [ro], "selector for the queue" Temporary boolean [ro], "N/A" {code} This gives the impressions that the {{MessageCount}} is not used in JMS but only in the Core. However, in my tests {{MessageCount}} seems to be correct in JMS too. So, what does {{N/A}} mean here?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-405

18803	ARTEMIS-374	Github user jbertram commented on the pull request: https://github.com/apache/activemq-artemis/pull/362#issuecomment-178012905 I need some way to differentiate messages that are put on the head of the queue by the scheduler and those that aren't because they need to be treated differently (notice the new 'if' block in addHead()). A message property seemed the simplest way to do that, but I'm open to other possibilities. Do you have any suggestions here?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-374
18804	ARTEMIS-374	Github user jbertram commented on the pull request: https://github.com/apache/activemq-artemis/pull/362#issuecomment-178061415 I'm not following. From what I can tell in addHead() (where I need to do the check) Rreference.getScheduledDeliveryTime() will always return 0 so there's no way to differentiate scheduled messages from non-scheduled messages by using this property. Can you clarify your suggestion?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-374
18805	ARTEMIS-373	[~martyntaylor] I'd like to know more details about this improvement. Is it still valid?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-373
18806	ARTEMIS-373	Is the java test related here is JDBCJournalTest.java ?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-373
18807	ARTEMIS-373	[~martyntaylor] At first, when I run JDBCJournalTest.java, testCallBacks and testReadJournal passed whereas testInsertRecords failed. Then, I remove the Thread.sleep() line in testInsertRecords and after that it also passed. So, Is that it or what to do next? Thanks.	0	0	https://issues.apache.org/jira/browse/ARTEMIS-373
18808	ARTEMIS-355	As I understand the documentation a single JMS bridge is closely tied to a single source/target destination pair. Just to make sure I understand you correctly. Are JMS bridges really a viable temporary solution if you need seamless duplex connectivity for all JMS destinations across all nodes of a broker network?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-355
18809	ARTEMIS-347	This looks complete. Can you resolve it, [~clebertsuconic]?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-347
18810	ARTEMIS-339	Is this done?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-339
18811	ARTEMIS-322	Hi Clebert, I'm sorry about that, I'm new one day on this. I will try to explain better, I'm trying to implement and Junit test as a method above. When I'm using the ActiveMQ Artemis core lib, I was debugging the code because every time I'm getting the error code: {panel:title=My Exception|borderStyle=dashed|borderColor=#ccc|titleBGColor=#F7D6C1|bgColor=#FFFFCE} javax.jms.JMSException: There is no topic with name topic at org.apache.activemq.artemis.jms.client.ActiveMQSession.createTopic(ActiveMQSession.java:373) at com.redhat.messaging.topicagents.Publisher.create(Publisher.java:52) at com.redhat.messaging.ArtemisRedHatTopicTestCase.testSendTextMessageToDestination(ArtemisRedHatTopicTestCase.java:29) at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method) at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:57) at sun.reflect.DelegatingMethodAccessorImpl.invoke(DelegatingMethodAccessorImpl.java:43) at java.lang.reflect.Method.invoke(Method.java:606) at junit.framework.TestCase.runTest(TestCase.java:176) at junit.framework.TestCase.runBare(TestCase.java:141) at junit.framework.TestResult$1.protect(TestResult.java:122) at junit.framework.TestResult.runProtected(TestResult.java:142) at junit.framework.TestResult.run(TestResult.java:125) at junit.framework.TestCase.run(TestCase.java:129) at junit.framework.TestSuite.runTest(TestSuite.java:252) at junit.framework.TestSuite.run(TestSuite.java:247) at org.junit.internal.runners.JUnit38ClassRunner.run(JUnit38ClassRunner.java:86) at org.eclipse.jdt.internal.junit4.runner.JUnit4TestReference.run(JUnit4TestReference.java:50) at org.eclipse.jdt.internal.junit.runner.TestExecution.run(TestExecution.java:38) at org.eclipse.jdt.internal.junit.runner.RemoteTestRunner.runTests(RemoteTestRunner.java:459) at org.eclipse.jdt.internal.junit.runner.RemoteTestRunner.runTests(RemoteTestRunner.java:675) at org.eclipse.jdt.internal.junit.runner.RemoteTestRunner.run(RemoteTestRunner.java:382) at org.eclipse.jdt.internal.junit.runner.RemoteTestRunner.main(RemoteTestRunner.java:192) {panel} As you can see, I created a topic called topic on my code bellow: {code:borderStyle=solid} // create a Session session = connection.createSession(false, Session.AUTO_ACKNOWLEDGE); // create the Topic to which messages will be sent Topic topic = session.createTopic("topic"); {code} I debbuged and I would like a help to fix it, on package org.apache.activemq.artemis.core.protocol.core.impl.ChannelImpl who package org.apache.activemq.artemis.core.protocol.core.impl.ActiveMQSessionContext on line 243 has a piece of code {code} public ClientSession.AddressQuery addressQuery(final SimpleString address) throws ActiveMQException { SessionBindingQueryResponseMessage_V2 response = (SessionBindingQueryResponseMessage_V2) sessionChannel.sendBlocking(new SessionBindingQueryMessage(address), PacketImpl.SESS_BINDINGQUERY_RESP_V2); return new AddressQueryImpl(response.isExists(), response.getQueueNames(), response.isAutoCreateJmsQueues()); } {code} this response value is not comming with values, and I understand should return that my topic exists. Because I'd created a temporary topic as I told you before.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-322

#	Requirement	Questions	Answered	Successfully Answered	URL
18812	ARTEMIS-322	I appreciate the willingness to ensure this is a configurable option. I am curious what the reasonable Use Case is for _enforcing_ Topic's to be created at an Administrative level? Or a better question is, what is the Use Case for a product *failing* if a Topic has not been created via the Administrative Console? This very question had resulted in a lengthly debate back in the day when JBoss MQ was just getting started. The specification states that the creation, deletion and management of Topic's are out of the JMS scope. The API and specification provides for a TemporaryTopic for 'reply scenarios', however, that topic can only be used by the TopicConnection which created it. Meaning any sort of TopicConnection pool becomes untenable. There were also issues with Selectors so that wasn't usable either. Then we had to deal with the Use Case of creating unique, per-client, durable queue's on an as-needed basis. For example, a client is launched which receives a live stream of events. That client is meant to be long running and always up to date. The idea would be to create a Durable Subscriber on a brand new Unique Queue which receives the events for that Client. The client could then specifiy any filtering criteria when registering for the events. Due to Client's having access to different sets of Events based on ACL's, or potentially being slightly off from one another it isn't possible to have a single _known_ queue ahead of time. And again, TempTopic's cannot be durable and are stuck to that TopicConnection. The client crashes, gets disconnected, or uses a connection pool and TempTopic's cannot be used. In today's age of Messaging systems all these problems aren't really issues anymore. Routes and Exchanges in AMQP solve so many problem. Modern JMS implementations do very well with JMSReplyTo, Selector's and allowing on-demand queue's/topic's to be created. I bring all this up because at the end of the day it literally took 3 lines of code to change JBoss MQ (which i did on my own fork of the code) to allow for the creation of dynamic queues. And the merge requests were denied as the specification didn't account for the administration of queues and topics. The bigger issue was that JBoss MQ was ALSO lacking any sort of reasonable API and CLI interface to administer the queues. So to make an application work a person had to log into the administrator console and add every single Topic and Queue along with any permissions, if needed, before the application would work. Again, thank you for taking the time to take into consideration the idea that there are valid use cases for wanting to dynamically create topics and queues. Making it configurable provides the best of both. JBoss MQ (aka JBoss Messaging) was the ONLY Broker to enforce this restriction making it all the more incredulous. Now that we have a protocol AND specification of AMQP, that seems to be the way forward. It handles exponentially more scenarios then the JMS API. Thank you all for the work you do.	0	0	https://issues.apache.org/jira/browse/ARTEMIS-322
18813	ARTEMIS-252	What's the difference between that and move? How retry would work with topics? the move operation would put it back to all the subscriptions.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-252
18814	ARTEMIS-252	I like the idea yeah. I just wanted to clarify what to do on the topic case. If you resend back to the address all subscriptions will get the message. Do we need to send back to the single subscription where it came from? If u send a PR I can complete with the topic case if needed. There is hack that could be used to limit a core internal queue or topic subscriptions	1	1	https://issues.apache.org/jira/browse/ARTEMIS-252
18815	ARTEMIS-252	I guess question is what would be the semantic on activemq 5? Would it deliver back to the failed subscription only?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-252
18816	ARTEMIS-245	That's all that's needed? Why don't you send a Pull Request instead of a patch?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-245
18817	ARTEMIS-245	Is this patch sufficient to get the RA working with TomEE?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-245
18818	ARTEMIS-245	that's all it's needed? why don't you send a Pull request at https://github.com/apache/activemq-artemis/pulls	0	0	https://issues.apache.org/jira/browse/ARTEMIS-245
18819	ARTEMIS-245	The JavaDoc for javax.resource.spi.DissociatableManagedConnection (which you've implemented in your patch) says, "An implementation of this interface must support the lazy connection association optimization." It's not clear to me that the Artemis RA supports this optimization. Can you confirm that it does? Otherwise this change wouldn't be appropriate.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-245
18820	ARTEMIS-235	This issue is unresolved and marked as to be fixed for 1.1.1. However, 1.2.0 has already been released... Could it be targeted for 1.3.0 instead?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-235

18827	ARTEMIS-208	Github user clebertsuconic commented on the pull request: https://github.com/apache/activemq-artemis/pull/132#issuecomment-134293839 This fix will only work on tests.... on a default server, the acceptor will be at 0.0.0.0, and you will be sending tcp://0.0.0.0:port to the client. It's also wrong to the fact that the same protocolManager will server multiple acceptors in case you have multiple ports configured. on that case you will be sending the BrokerInfo for a different port or IP. Do you have the IP the user used to connect anywhere on the connection? So, you would have to create a brokerInfo per request.. instead caching a single one... for that reason this fix is not valid!	1	1	https://issues.apache.org/jira/browse/ARTEMIS-208
18828	ARTEMIS-201	Github user clebertsuconic commented on the pull request: https://github.com/apache/activemq-artemis/pull/245#issuecomment-158999892 @jbertram think the following: An user sets 100 destinations.. with 100M cache... the memory would be able to fit only 10 paged destinations.. The user has monitoring in place... whenever a consumer drops and page increases he will take action and restart the client... that means... he would make sure he wouldn't get to the 100 paged message using monitoring tools... That's a valid scenario.. with your messages users will assume they must have memory available at all times.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-201
18829	ARTEMIS-201	Github user clebertsuconic commented on the pull request: https://github.com/apache/activemq-artemis/pull/245#issuecomment-159134310 Can you at least say "when you have more than X destinations in page mode" on your log message? X = Memory Size / Page MAX-Size... just as an approximation	1	1	https://issues.apache.org/jira/browse/ARTEMIS-201
18830	ARTEMIS-201	I did this per user's request... This can go away with 1.5.0 now, since you can setup global-max-size. We can set this to INFO or change the logs for sure. What do you suggest as a message?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-201
18831	ARTEMIS-200	Github user gaohoward commented on the pull request: https://github.com/apache/activemq-artemis/pull/163#issuecomment-139489885 Hi clebert, it's strange the protonTest failed in this build. I don't think my changes affect that. My local build is all fine. Anyway can you take a look of my new code changes? Thanks	1	1	https://issues.apache.org/jira/browse/ARTEMIS-200
18832	ARTEMIS-193	[~ataylor284] https://github.com/apache/activemq-artemis/blob/master/tests/integration-tests/src/test/java/org/apache/activemq/artemis/tests/integration/openwire/SimpleOpenWireTest.java#L478 It's working, what doesn't work?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-193
18833	ARTEMIS-163	Github user clebertsuconic commented on the pull request: https://github.com/apache/activemq-artemis/pull/98#issuecomment-125996627 What was done as part of this: - The native layer is now a simplified native implementation. In theory much easier to implement. - The native layer won't call any mallocs for io_submit though, get_iocb is a function that will have a cirtcular cache of objects that will be reused on writes. we used to malloc before every write submit - I have moved stuff around to make it easier to understand (for instance separated packages for nio and aio under the journal) - merged AIOCallback and a useless class IOSubmit into a single IOCallback - added a test on create to sync test performance - The callbacks are also reused now through a circular log Everything else stayed the same, the whole testsuite is passing and I have executed extensive tests on this (through manual testing)	1	1	https://issues.apache.org/jira/browse/ARTEMIS-163
18834	ARTEMIS-149	We already have notifications which is the same thing basically. Do we need to implement anything here?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-149
18835	ARTEMIS-149	Is that an open wire thing, or an activemq thing? We can probably refactor the test to use the new API?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-149
18836	ARTEMIS-149	Github user gaohoward commented on the pull request: https://github.com/apache/activemq-artemis/pull/64#issuecomment-119778194 Can you take a look @clebertsuconic ? Thanks.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-149
18837	ARTEMIS-149	Github user clebertsuconic commented on the pull request: https://github.com/apache/activemq-artemis/pull/64#issuecomment-119791408 I need your help with something.. right now I can't include the activemq-tests on the PRs because they are using invalid javadocs.. do you think you could fix that? remove the javadocs?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-149
18838	ARTEMIS-149	Github user gaohoward commented on the pull request: https://github.com/apache/activemq-artemis/pull/64#issuecomment-119795768 do you mean remove the javadocs in every java file in amq5 tests? I can do that.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-149
18839	ARTEMIS-146	Why it can't depend on the JMS stuff? I don't see how open wire would work without JMS.	1	0	https://issues.apache.org/jira/browse/ARTEMIS-146
18840	ARTEMIS-146	Github user gaohoward commented on the pull request: https://github.com/apache/activemq-artemis/pull/55#issuecomment-116439289 I don't think this has to do with any JMS queues and JMX objects. It's only for openwire. Why it is not valid?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-146
18841	ARTEMIS-146	Github user clebertsuconic commented on the pull request: https://github.com/apache/activemq-artemis/pull/55#issuecomment-116444946 First, you are changing semantics of a production of a production server because the test is not adapting... it's wrong. Second, when a JMS Object is created it needs to also create JMS objects for the JMS Created Queue, that should happen through the JMS Manager. You are cutting this directly into a core-queue, it's also wrong. Why can't you fix the test and add the JMS Manager?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-146
18842	ARTEMIS-146	Github user gaohoward commented on the pull request: https://github.com/apache/activemq-artemis/pull/55#issuecomment-116448885 OK I get your point. The reason I didn't want to bring in JMS manager is because openwire is not supposed to depends on JMS manager. It should depends only on the core server. Like jms manager, the openwire should only be a facade layer around core. isn't it?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-146
18843	ARTEMIS-146	Github user gaohoward commented on the pull request: https://github.com/apache/activemq-artemis/pull/55#issuecomment-116913275 Hi Clebert, I updated the branch, can you take a look? Thanks Howard	1	1	https://issues.apache.org/jira/browse/ARTEMIS-146
18844	ARTEMIS-128	Github user clebertsuconic commented on the pull request: https://github.com/apache/activemq-artemis/pull/9#issuecomment-106791273 This PR seems dependent on #8, why don't you cherry-pick this commit into that branch and have a single PR?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-128

#	Requirement	Questions	Answered	Successfully Answered	URL
18845	ARTEMIS-127	Github user clebertsuconic commented on the pull request: https://github.com/apache/activemq-artemis/pull/8#issuecomment-106826140 Howard, your PR doesn't build because of these issues: /work/apache/six-merge/artemis-selector/target/generated-sources/javacc/org/apache/activemq/artemis/selector/hyphenated/SimpleCharStream.java:223: error: [DepAnn] Deprecated item is not annotated with @Deprecated public int getColumn() { ^ (see http://errorprone.info/bugpattern/DepAnn) Did you mean '@Deprecated'? /work/apache/six-merge/artemis-selector/target/generated-sources/javacc/org/apache/activemq/artemis/selector/hyphenated/SimpleCharStream.java:232: error: [DepAnn] Deprecated item is not annotated with @Deprecated public int getLine() { ^ (see http://errorprone.info/bugpattern/DepAnn) Did you mean '@Deprecated'? /work/apache/six-merge/artemis-selector/target/generated-sources/javacc/org/apache/activemq/artemis/selector/strict/SimpleCharStream.java:223: error: [DepAnn] Deprecated item is not annotated with @Deprecated public int getColumn() { ^ (see http://errorprone.info/bugpattern/DepAnn) Did you mean '@Deprecated'? /work/apache/six-merge/artemis-selector/target/generated-sources/javacc/org/apache/activemq/artemis/selector/strict/SimpleCharStream.java:232: error: [DepAnn] Deprecated item is not annotated with @Deprecated public int getLine() { ^ (see http://errorprone.info/bugpattern/DepAnn) Did you mean '@Deprecated'? Note: Some input files use unchecked or unsafe operations.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-127
18846	ARTEMIS-127	Github user gaohoward commented on the pull request: https://github.com/apache/activemq-artemis/pull/8#issuecomment-107281546 The code is only for compiling and running the tests to get the result. after that do a 'mvn clean' will get rid of all those codes.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-127
18847	ARTEMIS-127	Github user gaohoward commented on the pull request: https://github.com/apache/activemq-artemis/pull/8#issuecomment-107915237 Hi Clebert, I got the PR build passed finally. Can you take a look at it? Thanks Howard	1	1	https://issues.apache.org/jira/browse/ARTEMIS-127
18848	ARTEMIS-127	Github user clebertsuconic commented on the pull request: https://github.com/apache/activemq-artemis/pull/8#issuecomment-107951267 @gaohoward I don't understand this... what's under ./activemq5-unit-tests... it seems the whole activemq5 broker implementation. You even have a ProtocolManagerFactory for the OpenWireProtocol there. Why do you need a whole broker implementation for tests? you could just depend on the maven package.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-127
18849	ARTEMIS-127	Github user clebertsuconic commented on the pull request: https://github.com/apache/activemq-artemis/pull/8#issuecomment-107992912 There must be a better way. Why don't you just implement BrokerService properly instead of depending on the whole activemq5?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-127
18850	ARTEMIS-127	Github user clebertsuconic commented on the pull request: https://github.com/apache/activemq-artemis/pull/8#issuecomment-109303356 I'm good either way. The good thing about having the tests committed is it would be easier to maintain them on the long term. Howard had a whole broker copy on the commit here that's why we asked the change. @gaohoward I'm taking a day off today, I can look on this on monday. You can keep working on this. BTW: You had a fix as part of this PR. is it lost or did you squash it? don't forget to update JIRA please.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-127
18851	ARTEMIS-127	Github user thiagokronig commented on the pull request: https://github.com/apache/activemq-artemis/pull/8#issuecomment-110427482 @clebertsuconic please update the parent version pom: <version>1.0.0-SNAPSHOT</version> Should we have some kind of rule in the build to enforce that a child pom always conform with his parent, to at least generate a warning?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-127
18852	ARTEMIS-127	Github user clebertsuconic commented on the pull request: https://github.com/apache/activemq-artemis/pull/8#issuecomment-110828541 I think we should keep Error Prone on the compilation.. unless it starts to bother people. So far I think it's useful. can you send the PR?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-127
18853	ARTEMIS-119	start it for some reason: I built the server, create the server, ran it and got an exception ```sh cd artemis-distribution/target/apache-artemis-1.0.1-SNAPSHOT-bin/apache-artemis-1.0.1-SNAPSHOT/bin ./artemis create /tmp/myserver --user a --password a --allow-anonymous y cd /tmp/myserver/bin ./artemis run ``` and I got this: ``` 23:29:35,747 INFO [org.apache.activemq.artemis.integration.bootstrap] AMQ101005: Using broker configuration: xml:/tmp/lixo/etc/bootstrap.xml 23:29:36,202 INFO [org.apache.activemq.artemis.integration.bootstrap] AMQ101000: Starting ActiveMQ Artemis Server 23:29:36,235 INFO [org.apache.activemq.artemis.core.server] AMQ221000: live Message Broker is starting with configuration Broker Configuration (clustered=false,journalDirectory=../data/journal,bindingsDirectory=../data/bindings,largeMessagesDirectory=../data/large-messages,pagingDirectory=../data/paging) 23:29:36,273 INFO [org.apache.activemq.artemis.core.server] AMQ221013: Using NIO Journal 23:29:36,337 INFO [org.apache.activemq.artemis.core.server] AMQ221043: Protocol module found: [artemis-server]. #	Requirement	Questions	Answered	Successfully Answered	URL
18854	ARTEMIS-98	Github user HornetQBot commented on the pull request: https://github.com/apache/activemq-6/pull/206#issuecomment-93590710 Can one of the admins verify this patch by saying "ok to test"?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-98
18855	ARTEMIS-97	Github user jbertram commented on the pull request: https://github.com/apache/activemq-6/pull/205#issuecomment-92938159 My understanding is that these properties weren't change due to compatibility with older HornetQ clients. Have you tested these changes with HornetQ clients to ensure there are no regressions?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-97
18856	ARTEMIS-97	Github user HornetQBot commented on the pull request: https://github.com/apache/activemq-6/pull/205#issuecomment-92938168 Can one of the admins verify this patch by saying "ok to test"?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-97
18857	ARTEMIS-97	Github user clebertsuconic commented on the pull request: https://github.com/apache/activemq-6/pull/205#issuecomment-92983909 We will need to fix the testsuite before being able to merge this one... @jgenender you used your master for this... this PR will probably be open for a few days... Can you make sure you open a new branch if you send another PR non related to this? I will need a few days before I can merge this mainly because of the testsuite.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-97
18858	ARTEMIS-93	Are you interested that I help with the OSGi enabling?	1	0	https://issues.apache.org/jira/browse/ARTEMIS-93
18859	ARTEMIS-93	Github user cschneider commented on the pull request: https://github.com/apache/activemq-artemis/pull/254#issuecomment-160649094 Sorry.. forgot to use the profile again. I will make sure I run it from now on. Btw. The checks only seem to take 10 seconds for the whole build. Wouldn't it make sense to include them in mvn install? In this case I excluded the org.apache.activemq.artemis.cfg from the rat check as I think it does not make sense to add a license to a 3 line cfg. Is this ok?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-93
18860	ARTEMIS-92	[~jmesnil] What do you suggest? We could have an add transformer method on the Registry you mentioned, and whenever a class with that name is found we could just use that one. Any idea?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-92
18861	ARTEMIS-92	Github user clebertsuconic commented on the pull request: https://github.com/apache/activemq-artemis/pull/29#issuecomment-112476725 looks good.. will wait the build to merge it	1	1	https://issues.apache.org/jira/browse/ARTEMIS-92
18862	ARTEMIS-89	Github user mtaylor commented on the pull request: https://github.com/apache/activemq-6/pull/191#issuecomment-82264396 @clebertsuconic This was probably mentioned earlier, but this seems like a considerable change. Can we hold off merging until after the release. Thanks.	1	1	https://issues.apache.org/jira/browse/ARTEMIS-89
18863	ARTEMIS-80	Hi Andy, is the "old" config with acceptors/connectors still present? I'm asking because of compatibility reasons and easy migration. Looks like that both of the ways of configuration will be needed. Thanks, Mirek	0	0	https://issues.apache.org/jira/browse/ARTEMIS-80
18864	ARTEMIS-79	[~daniel.pocock] can you update this with your PR again for this? It seems we lost this over the renames.. but I had the impression this was merged already. Can you please let me know what's the state on this one here since I lost track due to the renames? I believe this one is done!	1	0	https://issues.apache.org/jira/browse/ARTEMIS-79
18865	ARTEMIS-43	Can I get a second set of eyes on this. We may have the wrong license. We seem to have: http://www.apache.org/legal/src-headers.html but from: http://www.apache.org/licenses/LICENSE-2.0.html#apply the expectation is something else. I wonder which is correct? Also, I ran:{code}mvn org.apache.rat:apache-rat-plugin:0.11:check{code} on https://git-wip-us.apache.org/repos/asf/activemq-6.git and there are 811 files that don't have a license. From http://www.apache.org/legal/src-headers.html - all human readable files should have a copyright header but there are exceptions, if the content is too simple to mandate a copyright - http://www.apache.org/legal/src-headers.html#faq-exceptions I think the xml config from the examples and starts scripts from the distro do fall under that category. But all of the documentation does not. The documentation in .md will need a license header me thinks, hence the reopen.	0	0	https://issues.apache.org/jira/browse/ARTEMIS-43
18866	ARTEMIS-43	Isn't this one done, Howard?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-43
18867	ARTEMIS-35	Whatever we do here keep it generic and pluggable	0	0	https://issues.apache.org/jira/browse/ARTEMIS-35
18868	ARTEMIS-19	Github user clebertsuconic commented on the pull request: https://github.com/apache/activemq-artemis/pull/13#issuecomment-108526486 I see that you changed a lot of tests.. but I didn't see any new tests validating the added semantic? did I miss anything there?	1	1	https://issues.apache.org/jira/browse/ARTEMIS-19
18869	ARTEMIS-13	I'm not a fan of auto-delete. I would probably mark them as transient because they're not registered on the server, but I wouldn't necessarily delete them (unless an MDB pointing to one would count as a constant consumer, hence never deleting it). Should it persist between restarts? Hmmm... not sure of activemq's behaviour here previously.	0	0	https://issues.apache.org/jira/browse/ARTEMIS-13
18870	ARTEMIS-13	Is this issue trying to resolve the same issue as https://issues.jboss.org/browse/HORNETQ-302 (Consider allowing creation of destinations via the pure JMS API)? Please disregard my off topic chatter below otherwise. :) If it is, you probably want to look into how ActiveMQ 5.x does it. AFAIK, in AMQ5 the JMS api Session.createQueue() methods does not communicate with the server, so the queues are created only when the first message is received by the broker. This saves a small amount of overhead in the createQueue method call. Nice, IMO! (Yes, you might argue that repetetive calls to createQueue is an antipattern, but it happens anyway.) https://github.com/apache/activemq/blob/trunk/activemq-client/src/main/java/org/apache/activemq/ActiveMQSession.java#L1264 AMQ5 users also expect the queues to be durable and non-temporary, i.e not removed when unsubscribed. I do not recall if you can configure thesese caracteristincs though.	0	0	https://issues.apache.org/jira/browse/ARTEMIS-13
18871	ARTEMIS-13	Ok, I understand the distinction between this and HORNETQ-302. Still, I ask that you consider the rest of my comment as relevant. Especially my point about not making them transient or auto-deleting destinations created this way. Autodeleting destinations, say created in a certain name space, seems like a separate functionality. Generally I do not see why destinations created automatically, once they are created, should be treated any different to destinations created in any other way (administratively, declaratively, using the native AMQ6-api, etc). That's not a distinction that exists in AMQ5. When this issue has been resolved, I would very much like to see that Session.createQueue in the AMQ6 api is a no-op, as far as server communication goes. Should I open a separate issue for that?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-13
18872	ARTEMIS-13	Could you please update the documentation accordingly to reflect this behavior? I have seen it used in [ARTEMIS-218|https://issues.apache.org/jira/browse/ARTEMIS-218] issue.	1	0	https://issues.apache.org/jira/browse/ARTEMIS-13
18873	ARTEMIS-13	[~michalxo], I'm not clear on what documentation needs to be added. The [original commit for this issue|https://github.com/apache/activemq-artemis/commit/e293d80f08de58e4ce2bafd9d63c1a4185e079a9] included documentation which describes the functionality (in queue-attributes.md). What specifically is lacking in your opinion?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-13
18874	ARTEMIS-12	What exactly is required for this task? Is this just for documentation purposes or do we want to change ActiveMQ 6 to be more like 5.x?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-12

#	Requirement	Questions	Answered	Successfully Answered	URL
18875	ARTEMIS-11	Is there anything left to do on the distribution or can this be resolved?	0	0	https://issues.apache.org/jira/browse/ARTEMIS-11
