

Urban Renewal at best is a semi-socialistic patchwork system, costing more than it is worth, and only temporarily helping to keep our obsolete cities alive. When Victory Cities are built in the near future, our present day obsolete cities soon will become living museums.

Victory Cities will in no way be connected with, be a part of, or be located in any present day city. A Victory City will be built from scratch in the countryside and will stand alone. All surrounding countryside will be owned and operated by Victory City Corp. No other buildings will be built in the area. A Victory City will build, maintain, and operate all highways leading to and circling the city.

There is at present time, no building, no city, and no project of any kind, anywhere in the world, that in any substantial way bears any resemblance to the plans for Victory Cities.

Victory Cities will receive no tax support from any government as do present obsolete cities.

Our present day cities are obsolete because they are unable to meet the problems of:

- growth of slums
- traffic congestion
- air pollution
- noise
- economic waste
- poorly coordinated municipal planning due to division of political authority

Economic waste is by far the biggest problem since it includes or is related to all the other problems of our present day cities. Victory City plans solve all these problems. This book will show you how.

Gradually replacing the old living museums, our present day cities, will be the city of the future, Victory Cities.

The old cities with numerous miniature buildings scattered around at random over vast areas of the countryside will become relics of the past. The miniature buildings are all connected up by a vast complicated network of transportation tangled up in knots, called intersections. Most of these cause traffic delays resulting in congestion or in short, transportation constipation.
